User information

This Network Rail standard contains colour-coding according to the following Red–Amber–Green classification.

Red requirements – *no variations permitted*

- Red requirements are to be complied with and achieved at all times.
- Red requirements are presented in a red box.
- Red requirements are monitored for compliance.
- Non-compliances will be investigated and corrective actions enforced.

Amber requirements – *variations permitted subject to approved risk analysis and mitigation*

- Amber requirements are to be complied with unless an approved variation is in place.
- Amber requirements are presented with an amber sidebar.
- Amber requirements are monitored for compliance.
- Variations can only be approved through the national variations process.
- Non-approved variations will be investigated and corrective actions enforced.

Green guidance – *to be used unless alternative solutions are followed*

- Guidance should be followed unless an alternative solution produces a better result.
- Guidance is presented with a dotted green sidebar.
- Guidance is not monitored for compliance.
- Alternative solutions should be documented to demonstrate effective control.

Compliance

This Network Rail standard/control document is mandatory and shall be complied with by Network Rail Limited and its contractors if applicable from 04 September 2021.

Where it is considered not reasonably practicable to comply with the requirements in this standard/control document, permission to comply with a specified alternative should be sought in accordance with the Network Rail standards and controls process, or with the Railway Group Standards Code if applicable.

If this standard/control document contains requirements that are designed to demonstrate compliance with legislation they shall be complied with irrespective of a project's PACE/GRIP stage. In all other circumstances, projects that have formally completed GRIP Stage 3 (Option Selection) may continue to comply with any relevant Network Rail standards/control documents that were current when GRIP Stage 3 was completed.

NOTE 1: *Legislation includes Technical Specifications for Interoperability (TSIs).*

NOTE 2: *The relationship of this standard/control document with legislation and/or external standards is described in the purpose of this standard.*

Disclaimer

In issuing this standard/control document for its stated purpose, Network Rail Limited makes no warranties, expressed or implied, that compliance with all or any standards/control documents it issues is sufficient on its own to provide safety or compliance with legislation. Users are reminded of their own duties under legislation.

Compliance with a Network Rail standard/control document does not, of itself, confer immunity from legal obligations.

Where Network Rail Limited has granted permission to copy extracts from Network Rail standards or control documents, Network Rail Limited accepts no responsibility for, nor any liability in connection with, the use of such extracts, or any claims arising there from.

This disclaimer applies to all forms of media in which extracts from Network Rail standards and control documents might be reproduced.

Supply

Copies of standards/control documents are available electronically, within Network Rail's organisation. Hard copies of this document might be available to Network Rail people on request to the relevant controlled publication distributor. Other organisations can obtain copies of this standard/control document from an approved distributor.

Legislation

This standard/control document has been reviewed to confirm it complies with relevant environmental and social legislation at the time of publication. Details of relevant legislation are available on Network Rail's Legal Register.

Compliance with this standard/control document does not, on its own, provide compliance with relevant legislation.

Compliance date:	04 September 2021

1 Purpose

This standard sets out Network Rail's minimum requirements for the management of environment and social risks and opportunities during design and/or construction activities.

The implementation of this standard delivers a range of benefits to Network Rail including:

a) improved business cost-efficiency from sustainable practices, such as designing for whole-life energy efficiency, waste minimisation, and capital carbon value engineering;

b) increased social value created by maximising opportunities for inclusive design, considerate construction and socio-economic growth;

c) reduced risk of legal and regulatory non-compliance and negative reputational exposure by delivering good practice standards of environmental and social performance; and

d) alignment with the Network Rail Environmental Sustainability Strategy.

2 Scope

This standard is mandatory for all construction and design works carried out by Network Rail and its contractors as part of a PACE managed project.

This standard applies to but is not limited to:

a) Designers/Contractors contracted to Network Rail for the provision of design and/or construction services;

b) Network Rail business units where they act as a design or contractor entity according to Construction (Design and Management) Regulations definitions, e.g. Network Rail Design Delivery and Works Delivery engaged in construction and design works; and

c) any non-construction works that comply with NR/L2/OHS/0044 – Planning & Managing Construction work.

This standard excludes any works associated with maintenance activities.

The requirements of this standard apply to all land areas impacted by project activities, including the primary development site(s) and, without limitation, any associated temporary work sites, compounds, haul roads, access routes.

Where a joint venture or alliance is established, this standard should be recommended as a minimum when defining contract requirements for those organisations accountable for design or construction within the alliance.

3 Definitions

As low as reasonably practicable (ALARP)

Reasonably practicable involves weighing the risk / benefit against the effort, time and money needed to control it. Any requirements within this standard should be applied to ALARP using a whole-life cost approach for their consideration.

Asset

Any item, entity, or property owned by Network Rail and regarded as having actual or potential value or function to the operation of the rail network, to other Network Rail business activities, or to other stakeholders.

Biodiversity

The variety and variability among all forms of life.

NOTE 1: *This includes terrestrial, marine, and other aquatic ecosystems and the ecological complexes of which they are part.*

Best Practicable Means (BPM)

Measures taken to reduce the impacts of noise and vibration caused by works.

NOTE 2: *BPM is defined in Section 72 of the Control of Pollution Act as 'reasonably practicable for the local conditions and circumstances, using measures including good design, good practice installation, maintenance, manner and periods of operation of plant and machinery, acoustic structures and the financial implications of each.'*

Building Research Establishment Environmental Assessment Method (BREEAM)

An international scheme that provides third-party certification for the assessment of sustainability performance for projects, infrastructure and buildings.

Capital Carbon

Includes all carbon dioxide and other greenhouse gas emissions associated with the creation, construction, refurbishment and end-of- life decommissioning and treatment of an asset.

NOTE 3: *The term capital carbon has emerged because all these activities are typically funded through capital expenditure (CapEx).*

NOTE 4: *The related term 'embodied carbon' is part of capital carbon but only applies to the carbon dioxide and other greenhouse gas emissions during the manufacture of specific materials and products.*

Civil Engineering Environmental Quality Assessment & Awards Scheme (CEEQUAL)

A sustainability assessment for engineering, infrastructure, landscaping and public realm projects.

Circular Economy

A circular economy is a sustainable alternative to the traditional linear economy of make, use and dispose. The aim of a circular economy is to extract fewer virgin resources from the planet and to keep existing resources in use for as long as possible. Resources, products and materials should be re-used, repaired and regenerated in order to extend their useful lifespan and extract their maximum environmental, social and financial value. This approach reduces embodied carbon, water and social impacts and keeps waste to a minimum.

Construction

The carrying out of any building, civil engineering or engineering construction work that includes:

a) the construction, alteration, conversion, fitting out, commissioning, renovation, repair, upkeep, redecoration or other maintenance (including cleaning which involves the use of water or an abrasive at high pressure, or the use of corrosive or toxic substances), de-commissioning, demolition or dismantling of a structure;

b) the preparation for an intended structure, including site clearance, exploration, investigation (but not site survey) and excavation (but not pre-construction archaeological investigations), and the clearance or preparation of the site or structure for use or occupation at its conclusion;

c) the assembly on site of prefabricated elements to form a structure or the disassembly on site of the prefabricated elements which, immediately before such disassembly formed structure;

d) the removal of a structure, or of any product or waste resulting from demolition or dismantling of a structure, or from disassembly of prefabricated elements which immediately before such disassembly formed structure;

e) the installation, commissioning, maintenance, repair, or removal of mechanical, electrical, gas, compressed air, hydraulic, telecommunication, computer or similar services which are normally fixed within or to a structure,

Construction does not include the exploration for, or extraction of, mineral resources, or preparatory activities carried out at a place where such exploration or extraction is carried out.

Contaminated Land

Land that has legally been defined as 'contaminated land' where substances are causing or has the potential to cause significant harm to people, property or protected species, significant pollution of surface waters (e.g. lakes and rivers) or groundwater, air pollution, and/or harm to people as a result of radioactivity. Land can become contaminated with:

- hazardous and/or non-hazardous materials from human activity (e.g. previous land uses, fuel spillages, fly tipping);
- invasive non-native species;
- naturally occurring hazardous substances like radon gas.

Contractor

Any person or organisation, including a non-domestic client, who carries out, manages or controls works (as defined above).

NOTE 5: *This can include a Network Rail business function that is contracted to complete work on behalf of another Network Rail business function.*

Design

Design includes any production of drawings, design details, specifications and bills of quantities (including specification of articles or substances) relating to a structure, and calculations prepared for the purpose of design.

Designer

Any person or organisation, including a client, contractor or other person, who:

- prepares or modifies a design
- arranges for, or instructs, any person under their control to do so,

relating to a structure, or a product or mechanical or electrical system intended for a particular structure. A person is deemed to prepare a design where a design is prepared by a person under their control.

NOTE 6: *This can include a Network Rail business function that is contracted to complete work on behalf of another Network Rail business function.*

Emergency Works

Works that must be undertaken immediately, without delay and with involvement from emergency services. The event is unexpected and serious, such that it presents a significant risk to human life, health and/or property, or the natural environment, and involves the need for immediate action to manage the risk.

Employer's Representative

Any role within Network Rail responsible for managing and delivering the contracted project or works activity at a given stage in the project/works life-cycle. This could be, without limitation, the Contract Manager, Development Manager, Project Manager, or Asset Manager.

Environmental Product Declaration (EPD)

An independently verified and registered document that communicates transparent and comparable information about the life-cycle environmental impact of products.

NOTE 7: *The International EPD System is a global programme for environmental declarations based on ISO 14025 and EN 15804.*

Forest Products

Any material derived from forestry, including timber, composite timber products, paper, card, etc.

Health & Safety File (HSF)

A file prepared to satisfy regulation 12(5) of the Construction (Design and Management) Regulations. The purpose of the HSF is to confirm that, at the end of a project, the client has information that anyone carrying out subsequent construction work on the same site or structure would need to be aware of in order to plan and carry out work safely and without risk to health.

Indicators

Indications of performance and/ or the likelihood of meeting targets. The most significant of these, for a business, are key performance indicators.

Non-construction works

Works outside the scope of construction works might include non-intrusive surveys and inspections carried out as part of the pre-construction phase, vegetation clearance that is not associated with the construction phase, and structures examinations.

Potable Water

Water that is safe to drink.

Preliminary Ecological Appraisal (PEA)

A rapid assessment of the habitats and ecological features, present or potentially present, within a site and within the wider zone of influence of a project or work site. A PEA normally comprises a desktop study and a site walkover survey such as an Extended Phase 1 Habitat Survey. The PEA will determine the need for further Phase 2 surveys. PEAs need to be conducted in accordance with the most current edition of Chartered Institute of Ecology and Environmental Management (CIEEM) Guidelines for Preliminary Ecological Appraisal.

Preliminary Risk Assessment (Contaminated Land)

The Preliminary Risk Assessment (Phase 1 desktop study) is the first stage of the contaminated land assessment process. This involves analysing historical and environmental information for the site and within a 250 m radius around the site as detailed in the Environment Agency's Land Contamination Risk Management (LCRM) guidance. A risk assessment report with conceptual site modelling will be undertaken. If this demonstrates no risk from contamination, the planning will be released, subject to local authority agreement.

Safety Central

Safety Central is a Network Rail managed website to promote best practice health, safety and sustainability within the rail industry. Network Rail environment and social guidance notes can be found on this website: https://safety.networkrail.co.uk/.

SKA Rating

SKA rating is an environmental assessment method, benchmark and standard for non-domestic fitouts, led and owned by the Royal Institute of Chartered Surveyors (RICS).

Social Performance

The extent to which Network Rail's operations, activities and decisions impact people- including passengers, employees, suppliers, communities or other groups affected by Network Rail's physical and socio-economic presence.

Social Value

Defined by Social Value UK as "the quantification of the relative importance that people place on the changes they experience in their lives. Some, but not all of this value is captured in market prices." The term 'social value' is used sometimes interchangeably with the term 'social performance.'

Structure

a) Any building, timber, masonry, metal or reinforced concrete structure, railway line or siding, tramway line, dock, harbour, inland navigation, tunnel, shaft, bridge, viaduct, waterworks, reservoir, pipe or pipeline, cable, aqueduct, sewer, sewage works, gasholder, road, airfield, sea defence works, river works, drainage works, earthworks, lagoon, dam, wall, caisson, mast, tower, pylon, underground tank, earth retaining structure or structure designed to preserve or alter any natural feature, and fixed plant; or similar,

b) Any formwork, falsework, scaffold or other structure designed or used to provide support or means of access during construction work.

Supplier

The term used within Network Rail contracting to refer to a Designer and/or contractor.

Traction Energy

The energy used to move trains.

Urgent Reactive works / Non-emergency unplanned works

Works that were not planned but must be undertaken urgently when a rail asset has failed due to a sudden and unforeseen event, fault or defect. There is not involvement from emergency services, but the work is deemed urgent in order to restore the rail network to a safe operating condition.

Weather Resilience and Climate Change Adaptation

Weather resilience is the ability of assets, networks and systems to anticipate, absorb, adapt to, and/or recover from disruptive weather events.

Climate change adaptation is action taken to improve the resilience of assets, networks and systems to future weather conditions, avoiding, minimising or mitigating the impact of more severe or frequent adverse and extreme weather events and gradual or erratic changes in weather patterns due to climate change.

Whole-life carbon

The sum of greenhouse gas emissions from all stages in the life cycle of an asset, including embodied carbon emissions of materials and products; capital carbon emissions from construction activities, major maintenance/ refurbishment/ replacement and end of life decommissioning and treatment; and operational carbon emissions from utilities consumption, minor servicing and maintenance.

4 Environment and Social Management Processes

4.1 Environment and Social Appraisal (ESA)

The ESA shall be completed at the start of a project and is a mandatory PACE product. The ESA is a live document and shall be updated at each PACE milestone or when significant changes to the project occur.

The ESA shall be reviewed and approved by the Network Rail Project Manager who shall confirm the ESA is complete and accurate.

The Employer's Representative shall confirm the Designer/Contractor has access to the most up-to-date project-specific ESA to understand the environmental and social impacts associated with the project.

NOTE 1: *The ESA is a Network Rail tool owned by the Employer's Representative that enables Network Rail to collate pre-construction information on environmental and social risks and opportunities. Consequently, it is not appropriate for construction Designer/Contractor to complete the ESA. The ESA can be carried out by another competent party (with access to the relevant information sources) on behalf of the Project Manager, as long as the review and acceptance is carried out internally.*

4.2 Environment and Social Management Plans (ESMP)

The Designer/Contractor shall produce an ESMP. The ESMP shall address all risks and opportunities identified by the ESA, applicable to the design or construction of the project, plus any other risks and opportunities identified by the Designer/Contractor.

The Network Rail ESMP template shall be mandatory for all works and shall include the documented requirements of this standard.

NOTE 2: *An ESMP template and guidance is available on the Environment and Sustainable Development page on Safety Central.*

NOTE 3: *Alliance and contracts for repeating design and works (e.g. track and signalling) may develop overarching ESMPs containing generic environmental management processes that comply with this standard. Project specific risks and opportunities shall be addressed in shorter site specific ESMPs.*

The ESMP shall include an environment and social risk assessment. The risk assessment shall identify the operational specific risks and opportunities associated with the project using data from the ESA, populated at the start of the project and updated as required.

Works on site shall not commence until the ESMP has been formally accepted in writing by the Network Rail Employer’s Representative.

For works where the contract mobilisation period is less than 28 days, the Designer/Contractor shall submit the ESMP documentation to the Employer’s Representative 14 days before on-site works commence or at a date agreed with the Employer's Representative.

Design ESMPs shall be submitted at a date agreed with the Employer's Representative.

For all other works, the ESMP shall be submitted in writing to the Employer’s Representative at least 28 days before on-site works commence. If the ESMP is not accepted by the Employer’s Representative, the Designer/Contractor shall resubmit

an updated ESMP within 10 days of receiving comments. The ESMP shall be resubmitted until accepted by the Employer's Representative.

The Project Manager shall complete the EN3 Review and Acceptance form.

NOTE 4: *Formal acceptance of the ESMP is through completion of this form.*

NOTE 5: *EN3 Review and Acceptance form is a PACE product within the PACE Product Index.*

5 General Requirements – all projects/works

5.1 Network Rail policies and strategies

The Designer/Contractor shall comply with all Network Rail policy, strategy and standards.

5.2 Roles and responsibilities

The Network Rail Project Manager shall allocate accountabilities and responsibilities for environment and social performance to named persons within the project team.

The Designer/Contractor shall notify and agree with the Employer's Representative any intended changes in managers with responsibilities for environment and social performance at least 28 days before they occur.

NOTE 1: *Appendix E of the Principal Contractor Licensing Scheme NR/L2/INI/CP0070 identifies environmental resourcing & competency requirements.*

5.3 Competence

A competence framework shall be used to understand and support organisational capability so that all staff have sufficient knowledge, skills, competence and experience to carry out the particular tasks and activities for which they are responsible.

The Designer/Contractor shall have appropriate environmental resources to comply with this Standard.

The Principal Contractor shall have appropriate environmental resources to satisfy the requirements set out in appendix E of NR/L2/INI/CP0070 and provide evidence, if requested, that the criteria have been met by those persons working on the project.

The Designer/Contractor shall follow legislative requirements at every stage of the project delivery.

5.4 Sub-contracting

Compliance with this standard shall be a requirement at tender stage and throughout the procurement and management of any sub-contractors.

Sub-contracting shall not absolve the Designer/Contractor from their accountability to Network Rail to meet the requirements of this standard.

5.5 Permits, Licences and Consents (PLCs)

The Designer/Contractor shall establish and/or maintain a PLCs register. The register shall contain details of:

a) all environment and/or social PLCs required by the design or construction phase of the project, as appropriate, along with conditions; and

b) allocated responsibility and accountability for discharging those conditions.

The Designer/Contractor shall comply with all PLCs as required.

The Designer/Contractor shall maintain a time-bound programme for applying for new or modified PLCs in line with the works programme and provide copies of any new or modified PLCs to the Employer's Representative within 7 days of receipt.

When instructed by the Employer's Representative, the Designer/Contractor shall become holder of any PLCs for the duration of the contract.

When instructed by the Employer's Representative, the Designer/Contractor shall transfer PLCs to Network Rail, or any agreed nominated person(s).

NOTE 2: *Each project develops a Land and Consents Strategy and Land and Consents Commitment Register to identify potential consents requirements. These documents can be made available on request.*

5.6 Objectives, targets and performance indicators

The Designer/Contractor shall progress any environmental and/or social commitments (e.g. target numbers of apprentices, carbon reduction targets) made earlier in the procurement and contracting process associated with the project, including any framework level targets.

If not already agreed prior to contract award the Designer/Contractor shall:

a) agree with the Employer's Representative, within 28 days of contract award, any project-specific environment and/or social objectives and targets and key performance indicators that will apply to the project or works. Targets shall meet the Employer's targets as a minimum where they have been set;

b) incorporate all targets into the ESMP;

NOTE 3: *The full list of national environment and social KPIs is available on the Environment and Sustainable Development page of Safety Central.*

c) collect and monitor the agreed national and local KPIs required by Network Rail and report these in accordance with the timescales outlined in the contract, and using the reporting platform approved by the contracting Network Rail business unit;

d) where specified by Network Rail use a prescribed tool to gather the raw data from which KPIs are derived; and

e) make available, upon request, data sources used to collate and verify reported KPIs.

5.7 Life Cycle Costing (LCC) and Option Selection

Life cycle costing shall be carried out for all works; regardless of size, complexity or type. Project decisions shall be based on the life-cycle of the asset, including environmental and social impacts, to deliver more efficient, more reliable and more sustainable long-term solutions rather than implementing a quicker, lower cost option.

Sponsors shall request for the LCC to be undertaken and for the impact of the project to be understood, at least qualitatively:

a) LCC test shall be carried out by the Sponsor and Project Manager at the strategic development phase.

b) LCC comparison shall be carried out by the PM, RAM, Engineers, CPM and/or Analyst at the project selection phase.

NOTE 4: *LCC analysis may be requested by the Sponsor or PM at the project development phase.*

NOTE 5: *The LCC handbook provides guidance on how life cycle costing is applied within Network Rail available at https://alpcat.hub.networkrail.co.uk/Pages/LCC-User-Guide.aspx*

Alongside Capital Cost (Capex) and Operational Cost (Opex), the Option Selection process shall include considerations in terms of:

a) environmental and social sustainability;

b) design life;

c) constructability;

d) maintenance requirements and maintainability;

e) construction and operations health & safety;

f) accessibility;

g) consents requirements;

h) decommissioning; and

i) end-of-life.

The Designer shall assess the environmental and social risks and opportunities associated with design options and include findings and recommendations in the Option Selection Report.

A workshop/ review shall be undertaken to identify and assess design options, either as a standalone activity or as part of another workshop (e.g. LCC Comparison).

This principle shall also be applied by the Contractor during the delivery phase when selecting Products, Materials and Construction Methodologies.

NOTE 6: *Environmental Life Cycle Appraisal methodologies includes Life Cycle Assessment (LCA), Environmental Product Declaration (EPD) and Best Practicable Environmental Option (BPEO).*

5.8 Communication

5.8.1 Stakeholder Management Plan

The Designer/Contractor shall identify a list of stakeholders and appropriate methods of engagement and communication and document this in the ESMP. The Designer/Contractor shall use the information in the existing Network Rail Stakeholder & Customer Management Plan to complete the ESMP.

NOTE 7: *The list of stakeholders should include, but is not limited to, lineside neighbours, local authorities, parish councils, schools, local businesses and passengers.*

5.8.2 Internal communication

The Designer/Contractor shall communicate the project specific ESMP and associated controls to directly employed and subcontracted personnel.

The Designer/Contractor shall provide additional ongoing briefings and communication of specific environment and social requirements to direct and subcontracted employees, according to their roles and responsibilities.

The Designer/Contractor shall maintain records of all briefings and communication activities.

The Designer/Contractor shall incorporate environment and social risks and opportunities and controls into instructional documents/ operational control procedures and document these within the ESMP.

The Designer/Contractor shall make available to interested parties the Environment and Social Performance Policies and project-specific environment or social performance data.

NOTE 8: *This includes but is not limited to, site inductions, the safe work pack (SWP) process, method statements, toolbox talks and task briefing documents.*

The Designer/Contractor shall nominate a person with responsibility for maintaining internal communication and for communicating any changes in policy, procedure or legislation, including changes to the materials on display.

5.8.3 External communication

The Designer/Contractor shall nominate a person with responsibility for community relations on site for:

a) briefing all staff about acceptable conduct;

b) overseeing the delivery of notification letters; and

c) providing the Network Rail community relations representatives any information they require in relation to the works.

The Designer/Contractor shall inform Network Rail local community relations representative(s) where work is within 200 metres of residential properties, schools, hospitals or business premises and might cause disruption or disturbance and/or impact Network Rail's reputation or may impact passenger or freight services. Communications shall address the potential significant environmental and social impacts on stakeholders as identified within the relevant risk assessments.

For noisier works, this distance will be increased to 500m.

NOTE 9: *Noisier works will be defined as the output of the Noise and Vibration Risk Assessment. Typical works might include but not be limited to piling, demolition works and tamping.*

NOTE 10: *Key stakeholders are identified in the Stakeholder Management Plan*.

NOTE 11: *The standard Communicating with the public - NR/L3/MTC/PL0215 contains information on how far in advance the public should be notified.*

The Designer/Contractor shall maintain a record of discussions held with statutory authorities.

In the event of an unplanned approach from a statutory authority, the Designer/Contractor shall inform the Employer's Representative and supply a record of the discussion.

5.8.4 Communication between Network Rail and suppliers

The Designer/Contractor shall organise a progress meeting with the Employer's Representative every 28 days, or at an interval otherwise agreed. The meeting shall include:

a) updates on risk and opportunities assessment;

b) risk controls and mitigations;

c) delivery of opportunities;

d) ESMPs;

e) Incident Response Plan (IRP) issues;

f) progress against targets;

g) KPI performance; and

h) audit/assurance monitoring findings.

NOTE 12: *This could be included in the Project and Progress Review meetings, or any other meetings where appropriate.*

5.9 Monitoring and assurance

The Network Rail Project Manager shall put in place a schedule of internal environment and social inspections.

The Designer/Contractor shall apply internal monitoring activities, such as inspections or audits, to check compliance with key environment or social controls from the ESMP.

The Designer/Contractor shall develop checklists to guide inspections and/or audits and include a schedule of inspections and audits within the ESMP.

The Designer/Contractor shall provide copies of inspections and audits, findings and action plans to the Employer's Representative within 28 days and at progress meetings.

5.10 Records, documents and knowledge transfer

Where duties transfer from one Designer/Contractor to another during the project life-cycle, the Designer/Contractor who is handing over shall, before completion of their contract, provide the Employer's Representative with an up to date ESMP. The Employer's Representative shall pass this on to the succeeding Designer/Contractor.

For each environment and social heading that the ESA confirmed as being applicable to the project the Designer/Contractor shall, before completion of their contract, provide the Employer's Representative with:

a) final copies of surveys;

b) risk assessments;

c) reports;

d) ESMPs;

e) records - including consents, permissions, licences and monitoring records;

f) best practice controls and mitigation measures;

g) a summary of environmental incidents, responses and lessons learnt; and

h) other relevant information for inclusion in the Health and Safety File/Operation & Maintenance (O&M) manuals.

The Project Manager or a delegated representative shall confirm that any relevant information is submitted in accordance with NR/L2/MTC/089 and complete NR/L2/MTC/089 Asset Management Plan Forms at project hand-over.

NOTE 13: *NR/L2/MTC/089 should be used to detail any ongoing environmental management works that are needed post hand-over. For example, any maintenance or monitoring required as part of biodiversity commitments, any maintenance requirements for habitats that have been created, or requirements contained within any licences, permits or consents.*

Before completion of the contract, the Designer/Contractor shall input environment and/social risks, features or survey data into the Network Rail National Hazard Directory in accordance with NR/L2/MTC/006.

5.11 Environment and Social data sources

5.11.1 General

The Network Rail representative shall interrogate internal and external environmental and social data sources from the start of the project to identify records of environment and/or social risks, features or surveys that might inform and/or constrain the project/works.

NOTE 14: *Readily accessible external data sources can be found in the Desktop study section of the ESA. Other external data sources such as those held by local authorities might need to be accessed.*

NOTE 15: *Internal data sources include GeoRINM Viewer (GRV), and the National Hazard Directory are available on the National Hazards website - http://www.nationalhazards.co.uk.*

NOTE 16: *The National Hazard Directory is a database for hazards on Network Rail's controlled infrastructure which can also record information on environment and social risks and/or features that might impact future works.*

5.11.2 Using data from external records

The Designer/Contractor shall verify the validity of external data sources and previous records used to support risk and/or opportunity identification.

NOTE 17: *The absence of previous environment or social records for the work site(s) does not mean that environment or social risks and constraints are not present.*

5.12 Health and Safety File

Before completion of works, the Designer/Contractor shall submit to the Employer's Representative environmental information that would be needed to manage health and safety risks during future work on the same site or structure into a Health and Safety File (HSF). HSF data management shall be in accordance with NR/L2/INF/02202.

NOTE 18: *Examples of environmental information includes contaminated land, flood risk, and emissions to air.*

5.13 Tax allowances and rebates

The Designer/Contractor shall investigate opportunities for tax allowances, rebates and incentives for sustainable design outcomes. Where tax allowance schemes have been applied, in accordance with HMRC conditions, these shall be documented in the ESMP.

6 Environment Requirements

6.1 Biodiversity

All works shall follow the process outlined in NR/L2/ENV/122/01.

In addition, for any works with a construction value over £20,000 or a footprint greater than 1500m^2 which will impact biodiversity, the Designer/Contractor shall undertake biodiversity metric calculations.

The Designer/Contractor shall use information from the Preliminary Ecological Appraisal (PEA) and other surveys to complete the biodiversity section of the ESMP.

Biodiversity metric calculations, PEA/ survey findings, protected species licences, assents and other ecology consents shall be provided by the Designer/Contractor to Network Rail in the format requested within 7 days of receipt.

6.2 Contaminated land

The Designer/Contractor shall conduct an Initial Hazard Review to determine whether the site could contain contamination associated with the current and previous activities on site and in the local vicinity. The Initial Hazard Review shall determine whether a Preliminary Risk Assessment (PRA) is required.

NOTE 1: *Dependant on the information already known about the site, it may be deemed appropriate to move straight to conducting a PRA.*

NOTE 2: *Further information on how to undertake an Initial Hazard Review and PRA is available in the Contaminated land guidance note available on Safety Central.*

Where the Initial Hazard Review cannot rule out potential contamination, the Designer/Contractor shall conduct a PRA including a conceptual site model and evaluate the risks associated with the pollution linkages. This shall be carried out by a Competent Person ahead of intrusive activities such as ground investigation.

NOTE 3: *The Contaminated land guidance note available on Safety Central has more detailed information on competent persons, including information on the Land Contamination Risk Management guidance which should be followed in all site assessments. (https://www.gov.uk/government/publications/land-contamination-risk-management-lcrm)*

Where the PRA identifies potential unacceptable risks to receptors, the Designer/Contractor shall conduct a Generic Quantitative Risk Assessment (GQRA).

If significant risks have been identified, the Designer/Contractor shall conduct an Options Appraisal and undertake remediation and verification to prevent, minimise, remedy or mitigate the effects of the unacceptable risk.

The Designer/Contractor shall use the information from the relevant assessments to complete the Contaminated Land section of the ESMP. The Designer/Contractor shall collate and provide information on contaminated land management to the Asset Manager on completion of the works and include in the Health & Safety File.

For projects affecting the track bed, the Designer/Contractor shall comply with NR/L3/ENV/044.

6.3 Emissions to air

The Designer/Contractor shall assess potential sources of harmful or nuisance pollutants (including dust) that may arise both during the construction and operation of the asset.

The Designer shall design in opportunities to reduce emissions to air to ALARP during the construction and operational use of the asset.

During construction works, the Contractor shall confirm that emissions to air are reduced to ALARP, taking into account construction plant and Non-Road Mobile Machinery.

The Designer/Contractor shall use the information from the relevant assessment to complete the Emission to Air section of the ESMP.

The Designer/Contractor shall collate and provide information on emissions to air to the Asset Manager on completion of the works and include in the Health & Safety File.

6.4 Energy and carbon

6.4.1 Managing Carbon in Infrastructure (PAS 2080)

The Network Rail Project Manager shall put arrangements in place to achieve collaboration between all value chain participants to investigate and drive carbon reduction opportunities across the asset life-cycle. The collaboration arrangements and carbon reduction proposals shall be documented in the carbon section of the ESMP.

The Designer shall promote well-reasoned proposals to encourage the client / asset owner / manager to adopt low carbon solutions across the asset life-cycle. Low carbon solution decision outcomes shall be documented in the energy and carbon section of the ESMP.

NOTE 4: *Publicly Available Specification (PAS) 2080:2016* Carbon Management in Infrastructure *was commissioned by the Green Construction Board. It establishes a framework for all parties involved in the infrastructure value chain to work collaboratively towards a common carbon reduction goal. Network Rail is undertaking work to align more closely with the guiding principles of PAS 2080.*

6.4.2 Whole life carbon

Throughout the planning, development, design and delivery of projects, decisions shall take into account the consequential impacts on aggregated carbon emissions across the modular stages of the asset life cycle, with the goal of reducing whole life carbon emissions.

NOTE 5: *The principle of whole life carbon management applies to all projects; regardless of size, complexity or type.*

For any works over £1 million comprising civil, mechanical or electrical engineering activities, the Designer/Contractor shall use the Rail Carbon Tool to identify and record opportunities for reduction of whole life carbon emissions.

The Rail Carbon Tool shall be used from project development and option selection through design and delivery, taking into account design options, material use, construction methods and transport/ logistics.

NOTE 6: *Complex componentry asset systems like signalling and telecoms can be excluded but this is limited to the systems. Any associated engineering works are unlikely to be excluded e.g. high volumes of copper, aluminium or concrete.*

The Designer/Contractor shall use the information from the carbon assessment to influence decisions on low carbon design, low carbon materials and carbon efficient construction methods/logistics and complete the whole life carbon section of the ESMP.

During construction activities, the Contractor shall use renewable energy power and energy efficient technologies to reduce emissions where the technology exists. This shall apply to all equipment used on site, including welfare facilities, lighting, and plant equipment (e.g. battery power, solar power, LED technology). Diesel or fossil-fuel use shall be avoided wherever technology equivalent alternatives exist.

NOTE 7: *The Rail Carbon Tool is available on the RSSB website or via the Capital Carbon page of Safety Central. Training on the Rail Carbon Tool is available via Oracle for NR employees or the RSSB website for the supply chain.*

6.4.3 Energy and operational carbon

The Designer/Contractor shall generate estimates for in-use operational energy (regulated and unregulated) and associated carbon emissions, excluding traction energy. This shall be done using an industry approved energy assessment methodology such as the Chartered Institute of Building Services Engineers (CIBSE) TM54.

The Designer shall propose options for energy efficiency and carbon reduction and use the information from the energy estimate to influence design decisions and complete the Energy and Operational Carbon section of the ESMP. Where practicable the design shall make use of any thermal storage, heat recovery, free cooling, renewable energy or natural lighting to minimise utility services.

For leased buildings, the Designer/Contractor shall undertake energy performance certification requirements and meet at least an Energy Performance Certificate (EPC) rating of C for all new buildings and a minimum rating of E for modified buildings using industry approved assessment methods.

The Designer/Contractor shall only make temporary or permanent connections following the connections and disconnections process as stipulated in NR/L3/ENV/305, with prior agreement in writing from the Employer's Representative. Each connection shall be sub-metered.

The Contractor shall establish, agree and track a commissioning assurance plan to verify that new services operate correctly and are within designed energy parameters.

The Contractor shall procure and install fixed services in accordance with the design specification and provide the Employer’s Representative with a commissioning plan to verify that key services are operating within predicted energy performance limits.

The Contractor shall procure and install fixed services in accordance with the design specification and provide the Employer's Representative with a commissioning plan to verify that key services are operating within predicted energy performance limits.

NOTE 8: *Network Rail guidance is published on the Energy and Carbon page of Safety Central.*

6.5 Circular Economy

6.5.1 Circular Economy Principles & Resource Efficiency

The Designer/Contractor shall incorporate the principles of circular economy to extend the service and future re-use of natural resources.

NOTE 9: *This could include designing with core construction materials that contain high proportions of recycled constituents and/or designing structures or features that can themselves be readily re-purposed, re-used or recycled at the end of the asset service life.*

The Designer shall conduct a Resource Efficiency Assessment/Workshop to identify opportunities for promoting resource efficiency, including designing out waste, reducing carbon and water use.

The Resource Efficiency Assessment/Workshop shall be reviewed, documented and refined during design and shall include:

a) optimising material use (including water) through engineering design including low carbon solutions;

b) reuse of materials (waste, water and surplus materials and equipment), including assessing the opportunity to use mechanisms such as, but not limited to:

   1) CL:AIRE 'Definition of Waste: Development Industry' Code of Practice for excavated materials;

   2) WRAP quality protocol for aggregates from inert waste;

   3) Environment Agency, Scottish Environment Protection Agency and/or Natural Resources Wales registered waste exemptions; and

   4) Consideration of opportunities to reuse materials via the Network Rail SurPlus app.

c) specification of reused, recycled and recyclable materials; and

d) assessment of end-of-life options for materials and components to assist with deconstruction to minimise disposal and maximise reuse.

NOTE 10: *The Resource Efficiency Assessment/ workshop could be incorporated into other design reviews, meetings, assessments or workshops such as the safe by design, value engineering, and HAZID. Guidance for undertaking a Resource Efficiency Assessment/ workshop is available on Safety Central.*

NOTE 11: *SurPlus is available to download from the Network Rail App Catalogue.*

NOTE 12: *Circular Economy principles will also be met by following many of the sections of this Standard, including Life Cycle Costing, Managing Carbon in Infrastructure, Whole life carbon, responsible sourcing of materials, timber and concrete/aggregate, Low Environmental Impact products and by implementing the waste hierarchy.*

6.5.2 Materials

6.5.2.1 Responsible sourcing

The Designer/Contractor shall identify opportunities for materials with low environmental and social impact in line with Network Rail's Environmental Sustainability Strategy when designing and procuring materials for works.

NOTE 13: *The Network Rail Environmental Sustainability Strategy is available on Safety Central.*

6.5.2.2 Low environmental impact products

The Designer/Contractor shall assess the range of products and materials proposed for use in the construction and fit-out of the project and identify those with negative environmental or social impacts during production, transport, installation, use, decommissioning and deconstruction.

NOTE 14*: Consideration could be given to harmful constituents such as the content of VOCs in paints, adhesives, resin-bond panel products, or the global warming potential of refrigerants in building heating, ventilation and air conditioning (HVAC) services.*

NOTE 15: *Assessment of products/ materials should also include information available from EPDs or Safety Data Sheets.*

The Designer/Contractor shall use the information from the assessment to influence design decisions, review cost-effective alternatives and incorporate these within the Materials section of the ESMP.

NOTE 16: *A practical example would be the life-cycle assessment of alternative refrigerant products in building HVAC services, and the comparison of alternative HVAC strategies (centralised versus decentralised).*

6.5.2.3 Responsibly sourced timber

All timber and timber derived products sourced by Network Rail and its Suppliers/Contractors shall be from legal and sustainable sources which are credibly certified by a third party and hold full documented chain of custody.

NOTE 17: *This is set out in Network Rail's Responsible Timber Sourcing Policy, which is available on Safety Central. Network Rail undertakes assurance activities on an annual basis to assess compliance against this policy.*

Timber species listed in Appendix I of the Convention on International Trade in Endangered Species (www.cites.org) shall not be specified or supplied. In addition, any species listed as endangered or critically endangered under the IUCN Red List shall not be specified or supplied.

The Designer/Contractor shall complete the Responsibly Sourced Timber section of the ESMP to outline the process for assuring that Network Rail's certification and chain of custody requirements are being met.

NOTE 18: *Chain of custody is demonstrated when delivery notes and invoices clearly state which consignment items are covered by the timber merchant's certification licence code(s).*

The Designer/Contractor shall define a project team member with accountability and authority for forest product procurement performance.

Where required by the Employer's Representative, the Designer/Contractor shall collate and submit itemised timber consignment data.

6.5.2.4 Concrete and aggregates

The Designer/Contractor shall assess the use of responsibly sourced concrete and/or aggregates in line with industry good practice.

A whole-life carbon approach shall be used to select the most sustainable material.

The Designer/Contractor shall use the information to complete the Materials section of the ESMP.

NOTE 19: *Responsibly sourced concrete and/or aggregates include:*

a) Materials able to demonstrate independent responsible sourcing certification under a recognised scheme, such as BES 6001; or

b) Secondary post-consumer recycled materials, with evidence to verify the supplier, product origins and previous use.

NOTE 20: *Network Rail Supply Chain Operations (SCO) sells most common types of recycled aggregate products that comes directly from spent railway ballast. For internal customers this can be ordered via the NROL procurement system. External customers can also order recycled aggregate by making an enquiry via the Network Rail Railway Recycling website (www.railwayrecycling.co.uk) or by directly contacting recycledaggregatesqueries@networkrail.co.uk.*

6.5.2.5 Herbicides

Herbicides shall only be applied in accordance with the product label and shall take into account the requirements of the Herbicide Agreement on Safety Central.

A person with BASIS certification shall:

a) specify the method of application of the chosen herbicide for the type of vegetation to be treated;

b) select the herbicide and dosage rates before work commences.

NOTE 21: *Prior to selecting a chemical application, alternative non-chemical management methods should be considered.*

NOTE 22: *Competency is satisfied by holding NPTC PA1 'Safe use of pesticides' and NPTC PA6 'Handheld Application.'*

The extent of the areas to be sprayed and any restrictions on use shall be provided to the operator in advance of the works.

Consideration shall be given to potential seepage to watercourses.

Complete NR/L3/TRK/003/TEF3069 when applying chemicals.

6.5.3 Waste

6.5.3.1 Waste Management

The Designer/Contractor shall comply with NR/L2/ENV/120.

The Designer/Contractor shall prepare a Site Waste Management Plan (SWMP) within the ESMP.

The design SWMP shall identify how the design can contribute to waste reduction, in order to inform the option selection and detailed design stages.

The construction SWMP shall identify how waste will be avoided and minimised through the construction stage of the project. It shall include forecasts of quantities

and types of waste expected to be reused, recycled, recovered and disposed of. It shall be updated through the project with actual quantities and types of wastes in these categories.

The Designer/Contractor shall apply the waste hierarchy and document within the SWMP the types, quantities and proportions of waste expected to be reduced, reused, recycled, recovered or disposed. A final version shall be provided with the project actual waste data including quantities, types and the chosen waste management option.

The Designer/Contractor shall comply with Network Rail waste targets as set by the Employer's Representative.

The Designer/Contractor shall collate and report waste data in accordance with the Employer's requirements.

For the design of stations, occupied buildings or depots, assess the waste types and estimated quantities expected monthly during the operation.

Buildings shall be designed with space for the safe movement, segregation and storage of operational wastes awaiting removal or re-use. The design shall also provide arrangements for cleaning waste storage areas and incorporate pollution controls.

The Contractor shall leave all work sites clear of waste on completion of the project.

***NOTE 23**: NR/L2/SCO/306 and NR/L2/SIG/11201/Mod A2-23 provide further information on redundant assets.*

***NOTE 24:** NR/L3/ENV/044 provides further information on planning and handling track excavation waste at the pre-works design stage and through delivery stages.*

6.5.3.2 Polychlorinated bi-phenols (PCBs)

The Employer's Representative shall identify potential PCB contaminated equipment and assets. Equipment and assets shall be tested, registered and disposed of in accordance with legal requirements.

***NOTE 25:** Network Rail maintains a PCB register containing details of known E&P assets containing PCBs.*

***NOTE 26:** A PCB checklist is available on Safety Central.*

6.6 Noise and Vibration

The Designer/Contractor shall comply with NR/L2/ENV/121.

The Designer/Contractor shall conduct a Noise and Vibration Risk Assessment (NVRA) and document this within the ESMP.

***NOTE 27:** Further information on the Noise and Vibration process and a NVRA template is available within NR/L2/ENV/121.*

The Designer/Contractor shall design and implement measures to control noise and vibration emissions using BPM to levels ALARP. This shall be documented within the ESMP.

The Contractor shall agree an appropriate noise and vibration monitoring programme with the Employer's Representative and, where appropriate, the relevant local authority.

The Designer/Contractor shall also take into account potential disturbance of sensitive ecological receptors by noise, vibration or light.

The Contractor shall seek Local Authority consent under Section 61 of the Control of Pollution Act before commencing works, unless agreement from the Employer's Representative confirms that construction noise will be managed without need of consent.

Consideration shall be given to where site access compounds are located.

6.7 Dust, odour and lighting

The Designer/Contractor shall design to control dust, intrusive lighting emissions and odour emissions from fixed or temporary plant and site construction activities. These design considerations shall be reduced to levels ALARP and documented within the ESMP.

The Contractor shall take into account the impacts of traffic - this shall be used to inform the Traffic Management Plan.

NOTE 28: *Network Rail guidance is published on the Noise, Nuisance and Disturbance page of Safety Central.*

6.8 Pollution of land / water

The Designer/Contractor shall not rely on temporary or permanent connections to any water supply or drainage infrastructure until agreement has been received from the Employer's Representative.

Where surface water and/or foul discharges are subject to regulatory environmental permits the designed interception/attenuation features shall satisfy the regulator or statutory undertaker's water quality and flow rate permit conditions.

The Designer/Contractor shall assess risks and pollution pathways for harmful materials that will be stored, handled, used during construction or transported, and shall put in place measures to reduce those risks to ALARP. The information from this risk assessment shall be used to influence design decisions and complete the Pollution of Land/ water section of the ESMP.

NOTE 29: *Environmental permits may be required for discharges to local water courses, abstraction or impoundment licenses, or permits to discharge liquid effluent to foul drains.*

NOTE 30: *Network Rail guidance is published on the Pollution of Land/Water page of Safety Central.*

6.9 Sustainable travel

Where the development involves provision of public parking facilities, the Designer/Contractor shall take into account the provision of facilities and infrastructure to support users of alternatively fuelled low-carbon vehicles.

Where the development involves design of new, extended or refurbished occupied buildings, the Designer/Contractor shall include facilities to promote low carbon modes of travel for building occupants.

The Sustainable Travel Hierarchy shall be considered for travel to and from site, and low emission vehicles shall be considered for use on site.

6.10 Water

The Designer/Contractor shall not rely on any permanent connections to existing water supply or drainage infrastructure without agreement in writing from the Employer's Representative and the relevant regulator/statutory undertaker.

The Designer/Contractor shall identify water reduction initiatives and reduce construction and operational water consumption to ALARP, including specifying water efficient plant and equipment.

[England only] The Designer shall comply with HM Government Building Regulations Approved Document G as a minimum for the design of water services in buildings.

The Designer/Contractor shall assess the scope and business case for reducing dependence on potable water for low grade non-potable uses, including any substantial water consuming processes.

NOTE 31: *Consideration should be given to rainwater harvesting and greywater recycling.*

Where the design proposes abstraction of ground water as a supplementary operational water source, the Designer shall assess the impact on any existing abstraction or impoundment licenses or requirements for new licences. The Designer shall coordinate the time, information and resources to successfully complete applications for new or modified abstraction licenses.

The Contractor shall procure and install fixed water/drainage services in accordance with the design specification and provide the Employer's Representative with a commissioning plan to verify that key services are operating within permitted performance limits.

NOTE 32: *Identify opportunities to use harvested water, grey water recycling, abstraction, tanker delivery and mains supply, both for construction activities and welfare use.*

6.11 Weather Resilience and Climate Change Adaptation (WRCCA)

The Designer shall assess the impacts of adverse and extreme weather and future climate change on the project/ works (assets and location) and use the findings to influence design decisions and health and safety plans.

The Designer shall produce a Weather and Climate Change Impact Assessment report which summarises the findings of the following activities:

a) identify the potential for weather events to impact assets and the area surrounding the project including direct/indirect impacts on rail infrastructure, neighbouring communities and/or the local environment;

NOTE 33: *This should include, but not be limited to; flooding (river, coastal, surface and groundwater), high and low temperatures, wind, lightning, adhesion, landslip/subsidence, and precipitation patterns (rain, snow hail). This should also include a high-level review of historic weather event impact occurrences at or adjacent to the location of the project.*

b) identify the potential for the project to change the capability of associated assets (drainage, earthworks, structures etc.) to deal with current and future weather events;

c) assess the impacts of future climate change on the levels of weather risk identified;

d) identify options for avoiding/reducing risk; and

e) use cost benefit and whole-life cost analysis methods to fully account for:

1) the operational, safety and asset degradation impacts of current weather and future climate change; and

2) the benefits of avoided costs realised through resilience intervention when assessing and selecting solutions for detailed design and delivery.

NOTE 34: *Network Rail guidance on how to undertake a climate change impact assessment (NR/GN/ESD11) and which climate change projections to consider (NR/GN/ESD23) is published on the Weather Resilience and Climate Change Adaptation page of Safety Central. The finalised Weather and Climate Change Impact Assessment Report should be reviewed and approved by the Project Manager prior to design approval.*

The Designer shall confirm the design includes resilience measures that could be used to avoid/reduce the weather and climate change impacts identified in the Weather and Climate Change Impact Assessment Report to ALARP over the project design life.

Where any new information becomes available during any project phase or design changes are made that raises the weather and climate change risk profile of the selected option to an unacceptable level, the option shall be reviewed, and the design amended by the Designer to return the risk to ALARP. The new information, any changes to the risk or design and any residual risk shall be recorded in the Weather and Climate Change Impact Assessment Report and managed within the ESMP.

The Designer/Contractor shall provide technical support to the Employer's Representative during engagement with environmental regulators and/or local authorities.

NOTE 35: *This is particularly relevant when considering collaborative opportunities to resolve mutual weather event and climate change risks for railway infrastructure and local communities (e.g. increasing size of culverts to support community flood alleviation projects).*

The Contractor shall assess the risk of flooding and sedimentation from all sources for temporary construction facilities such as warehouses, stockpiles, maintenance depots, site offices etc. and locate them outside flood plains or areas prone to other sources of flooding or sedimentation; or use appropriate protection measures to minimise the risk.

The Contractor shall include adverse and extreme weather risk (e.g. extreme heat, strong winds, lightning, heavy rainfall, flooding and snow) in health and safety risk control procedures.

NOTE 36: *The Network Rail Weather Service (www.nrws.co.uk) can be used to forecast adverse and extreme weather conditions in order to facilitate work planning.*

7 Emergency works and urgent reactive works

During emergency and urgent reactive works, implement measures to minimise environmental and social risks.

NOTE 1*: Following emergency and urgent reactive works, Network Rail standards and legal requirements shall be adhered to.*

8 Social Performance Requirements

8.1 Approach to Social Performance

The Designer/Contractor should consider conducting a workshop to plan their approach to social performance management.

NOTE 1: *As with other workshops as required by this standard, this can be incorporated into other existing workshops/ meetings and does not need to be stand-alone.*

The Designer/Contractor shall integrate their approach to social performance management into their ESMP and shall include:

a) social performance risks and opportunities;

b) objectives and any associated targets;

c) social performance metrics, indicators and any key performance indicators (KPIs) that will be used, how they will be collected and reported, and the frequency of reporting;

d) planning for risk management or mitigation and opportunity optimisation;

e) how workers will be trained and supported to apply the approach.

8.2 Being a caring neighbour

The Designer/Contractor shall manage the project, and their workers, so that risk of disruption and disturbance to passengers, lineside neighbours and local communities is managed or mitigated to ALARP.

The Designer/Contractor shall participate in any stakeholder consultation organised by the Employer's Representative.

The Designer shall assess the social impact of visually prominent structures and agree appropriate design responses.

Where work is taking place within 200 metres of residential properties, business premises or community rail activity (or up to 500m for noisier or more disruptive works as defined in the Noise and Vibration Risk Assessment), the Designer/Contractor shall inform the Network Rail local community relations representative.

NOTE 2: *Further information on the Noise and Vibration process and a NVRA template is available within NR/L2/ENV/121.*

The Designer/Contractor shall comply with Network Rail's requirements for notification, available on Safety Central, and agree the works notification process with the Regional Community Relations team.

The Designer/Contractor shall nominate a person with responsibility for community relations on site for:

a) briefing all staff about acceptable conduct;

b) overseeing the delivery of notification letters;

c) providing the Network Rail community relations representatives with any information they require in relation to the works.

Consideration shall be given to worker behaviour and the Contractor shall participate in any worker behaviour training if requested by the Employer's Representative.

The Designer/Contractor shall resolve enquiries and complaints from the general public on site where possible; direct all other enquiries and complaints to Network Rail's 24-hour helpline service (03457 11 41 41).

The Designer/Contractor shall comply with NR/L3/MTC/MG0194.

If requiring access to third party land, the Designer/Contractor shall contact the Network Rail Property Services team to confirm that either:

a) rights of access already exist to allow legal access to or occupation of third party land; and/or

b) arrange for negotiations to take place with the landowner for access/occupation requirements.

Where access is required to third party land, the Designer/Contractor shall approach Property Services at least 6 weeks prior to requiring use of third party land.

The Designer/Contractor shall not enter into any financial agreements or compensation without first agreeing these arrangements with Network Rail Community Relations.

NOTE 3: *Network Rail guidance is published on the Being a Caring Neighbour page of Safety Central.*

8.3 Connecting communities with the environment

The Designer shall take into account the social impact of any visually prominent structures that will replace trees and/or other vegetation. Agree design responses with the Employer's Representative.

The Designer shall take into account the safety implications of removing lineside vegetation, such as improved access for trespassers. Design responses shall be agreed with the Employer's Representative.

Any changes to design responses shall be included within the Connecting Communities with the Environment section of the ESMP.

NOTE 4: *Network Rail guidance is published on the Connecting Communities with the Environment page of Safety Central.*

8.4 Creating engaged employees and positive industry partnerships

The Designer/Contractor shall read and comply with Network Rail's behaviours and Code of Business Ethics, available on Safety Central.

NOTE 5: *The Code of Business Ethics aims to create a culture of openness, accountability, honesty, integrity and leadership across Network Rail's workforce and supply chain.*

The Designer/Contractor shall report any concerns, suspicions or knowledge of wrongdoing in Network Rail using Speak Out.

NOTE 6: *Speak Out is Network Rail's reporting service for such issues. Contact details and further information can be found on Safety Central.*

The Designer/Contractor shall implement an approach to managing risk of modern slavery that is aligned to Network Rail's anti-slavery and human trafficking policy, available on the Network Rail website.

The Designer/Contractor shall complete training in how to manage or mitigate modern slavery risk if requested by the Employer's Representative.

The Designer/Contractor shall promote workforce equality, diversity and inclusion, and address discrimination, in a manner aligned with Network Rail's "Everyone Matters" diversity and inclusion strategy.

The Designer/Contractor shall complete any equality, diversity and inclusion training if requested by the Employer's Representative.

The Designer/Contractor shall support the physical and mental health and wellbeing of their workers e.g. through fatigue management.

NOTE 7: *Network Rail guidance is published on the Creating Engaged Employees page of Safety Central.*

8.5 Inspiring tomorrow's workforce

The Designer/Contractor shall conduct an Employment and Skills Assessment to identify the opportunities for school engagement, entry-level employment and skills programmes as part of the works. The assessment shall review opportunities for:

a) early engagement (e.g. school visits);

b) work experience;

c) work placements;

d) traineeships;

e) returnships;

f) level 2, 3 and 4 apprenticeships and other entry-level roles;

g) graduate recruitment; and

h) development of skills of current workers.

The Designer/Contractor shall use the information from the Employment and Skills Assessment to complete the Inspiring Tomorrow's Workforce section of the ESMP.

The Designer/Contractor shall comply with any Section 106 requirements set by the planning authority.

NOTE 8: *Network Rail guidance is published on the Inspiring Tomorrow's Workforce page of Safety Central.*

NOTE 9: *An Employment and Skills Assessment template is available on Safety Central.*

8.6 Keeping communities safe

The Designer shall assess the risk of trespass created as a result of railway works.

The Designer shall use the assessment to influence design decisions and complete the Keeping Communities Safe section of the ESMP.

The Contractor shall check that all access points to the operational railway are secured when leaving the site, secure all plant/assets, and remove all redundant and/or unused plant/assets on completion of work.

Before starting work, contact the Suicide Prevention Team to understand if it is an area of concern (SuicidePrevention@raildeliverygroup.com). If it is, staff shall complete the rail industry suicide prevention module and be issued with the Suicide Prevention Handbook and TACTICS card both available as part of the rail industry Learning Tool.

NOTE 10: *To access the Learning Tool videos and suicide prevention materials, register for a free account on the RSP website using an industry email address (www.railsuicideprevention.co.uk). Once registered, a variety of materials are available including signposting to support if needed. Downloading the Save a Life app is also recommended available through the NR app catalogue.*

NOTE 11: *Network Rail guidance is published on the Keeping Communities Safe page of Safety Central.*

8.7 Making rail a great experience

The Designer/Contractor shall identify opportunities to improve the passenger experience as a result of station or lineside enhancement and complete the Making Rail a Great Experience section of the ESMP.

NOTE 12: *Network Rail guidance is published on the Making Rail a Great Experience page of Safety Central.*

NOTE 13*: Network Rail has established an independent Design Advisory Panel (DAP) to review the design impacts of projects on passengers, communities and the environment. The DAP can work with project teams to assure that high quality design is developed, and that projects meet the Network Rail Principles of Good Design. Guidance on the Design Advice Project is available - NR/GN/CIV/100/01.*

8.8 Making travel accessible and inclusive

The Employer's Representative shall complete a Diversity Impact Assessment (DIA) for any project work that has a potential to impact on people (e.g. passengers, employees, or lineside neighbours) throughout the duration of the project.

This shall include temporary works, temporary conditions (e.g. temporary use of car parking facilities at stations), permanent works and any staging works; and any work carried out at Network Rail managed stations or at franchised stations (e.g. lift replacements).

The Designer/Contractor shall collaborate with the Employer's Representative to inform the DIA.

NOTE 14: *DIA templates (including those for temporary works) are available on the Access and Inclusion SharePoint site.*

DIAs shall be reviewed at each PACE milestone.

The Designer/Contractor shall address, in their DIA(s), the impact of design and/or works on all protected characteristics. The Designer/Contractor shall use the DIA to influence design decisions towards achieving accessible and inclusive travel for all and complete the Making Travel Accessible section of the ESMP.

NOTE 15: *Protected characteristics include age, disability, gender reassignment, marriage and civil partnership, pregnancy and maternity, race, religion or belief, sex and sexual orientation.*

The Contractor shall confirm that any alternative routes put in place for construction activities do not negatively impact accessibility or use of the infrastructure for the duration of the work.

The Designer/Contractor shall engage with Network Rail's Built Environment Advisory Panel (BEAP) or any other inclusive design and construction initiative if requested by the Employer's Representative.

The Designer/Contractor shall participate in any equality, diversity and inclusion training if requested by the Employer's Representative.

NOTE 16: *Network Rail guidance is published on the Making Travel Accessible page of Safety Central.*

8.9 Respecting cultural heritage and rail history

The Designer/Contractor shall complete a heritage assessment as part of the Respecting Cultural Heritage and Rail History section of the ESMP, prepared in consultation with local and statutory authorities.

The Contractor shall carry out works so that there is no disturbance to:

a) scheduled monuments;

b) archaeological sites and deposits; and

c) buildings of historical and architectural interest (both statutorily listed buildings and important non-listed above ground features and structural elements).

NOTE 17: *Unauthorised works could result in criminal prosecution of the contractor.*

The Contractor shall allow the local planning authority and any nominated employee and/or archaeologist appointed by the Employer's Representative access to the site to monitor the archaeological evaluation and mitigation work as required.

In the event of unexpected archaeological finds such as remains or artefacts, the Contractor shall immediately suspend work until further instruction and inform the Employer's Representative.

For architecturally significant schemes that require planning consent/ listed building consent or are within a conservation area, the Designer shall request architectural layout acceptance by submitting NR/L2/CIV/003/F004.

NOTE 18: *Further guidance on heritage is available in the Guidance Note Heritage, Care and Development - NR/GN/CIV/100/05, and on the Respecting Cultural Heritage and Rail History page of Safety Central.*

NOTE 19: *Network Rail has established an independent Design Advisory Panel (DAP) to review schemes with a heritage impact. Guidance on the Design Advice Project is available - NR/GN/CIV/100/01.*

8.10 Supporting Britain's economic development

The Designer/Contractor shall utilise procurement processes that enable qualified and experienced suppliers or sub-contractors from these business groups to compete freely and fairly for contracts:

a) Small and Medium Enterprises (SMEs);

b) local businesses; and

NOTE 20: *'Local' in this context means suppliers that will serve contract delivery from an operational base up to 25 miles from the works.*

c) voluntary, community and social enterprises (VCSEs) and mutuals.

Where possible, the Designer/Contractor should provide at least two of the above business groups (SME, local, VCSE, mutuals) with opportunities to compete for any available contracts, throughout the duration of the project and record this in the ESMP.

Where possible, the Designer/Contractor should advertise job opportunities locally (in the same local authority area as the works) for example through Job Centres and local employment support and brokerage services. These should be recorded in the ESMP.

The Designer/Contractor should, where possible, pay workers at least the relevant Real Living Wage (as defined by the Living Wage Foundation) when they are delivering Network Rail contracts and record this in the ESMP.

NOTE 21: *Network Rail is an accredited Living Wage employer.*

NOTE 22: *Network Rail guidance is published on the Supporting Britain's Economic Development page of Safety Central.*

9 Incident management

9.1 Incident response

9.1.1 Incident Response Plan (IRP)

All Contractors shall produce an Incident Response Plan (IRP) within the ESMP, which shall be tested before finalising.

The IRP shall include:

a) operational control procedures to reduce the risk of potential incidents identified in the ESA and ESMP;

b) procedures to be followed in the event of an incident including control and mitigation measures, reporting lines, investigation and closeout;

c) procedures to be followed in the event of unexpected finds such as protected species, invasive species, contaminated land, pests and diseases of trees, or archaeological finds;

d) the responsibilities in the event of an incident;

e) the people to contact in the event of an incident including:

1) the Contractor's nominated responsible person;

2) relevant incident reporting procedure;

3) regulatory bodies including the Environment Agency and/or Scottish Environment Protection Agency, Natural Resources Wales, Natural England, Nature Scot, Marine Management Organisation, Marine Scotland and/or Local Authority;

4) Employer's Representative;

f) the IRP shall provide for a rapid response to any incident arising from the works in accordance with relevant legislation;

g) the IRP shall be briefed, communicated and available to site personnel. It shall also be available to additional personnel and organisations upon request;

***NOTE 1**: Control measures shall be communicated through inductions, the work package plan process/method statements, task briefing sheets, toolbox talks etc.*

h) reporting of environment and social incidents shall be in line with NR/L3/INV/3001, NR/L3/OHS/0046; and NR/L3/OPS/045/4.04;

i) notify the Employer's Representative about Category 1 (major, serious, persistent and/or extensive impact) or Category 2 (significant impact) environment and/or social incidents at the earliest reasonable opportunity after the occurrence, and confirm the report in writing with preliminary findings within 12 hours;

***NOTE 2:** Network Rail guidance on categorisation of environment incidents is published on the Environment page of Safety Central.*

***NOTE 3:** For Category 1 and 2 incidents, earliest opportunity would include contacting the Employer's Representative out of normal working hours.*

j) notify the Employer's Representative about Category 3 (minor or minimal impact) or Category 4 (negligible impact) environment and/or social incidents at the earliest reasonable opportunity after the occurrence, and confirm the report in writing with preliminary findings within 48 hours;

***NOTE 4:** For Category 3 and 4 incidents, earliest reasonable opportunity would be during normal working hours.*

k) complete a Network Rail Preliminary Report and Investigation Form (Level1) [Form NR2072P] for Category 1, 2 and 3 incidents.

***NOTE 5:** The NR2072P will collate basic information about the incident until such time as a more detailed investigation and report has been completed.*

9.1.2 External reporting

Where harm has been caused to the environment, or a situation created that poses a risk of harm to the environment, the incident shall be reported to Environment Agency, Scottish Environment Protection Agency, Natural Resources Wales, Natural England, Nature Scot and/or and Local Authority.

External contractors shall liaise with the Employer's Representative to agree communications with the relevant regulator.

Any incident reference numbers provided by the regulator shall be recorded and notified to the Employer's Representative.

***NOTE 6:** Network Rail guidance on when and how incidents are to be reported is published on Environment page of Safety Central.*

9.2 Incident investigation

The Designer/Contractor shall:

a) investigate environment and social incidents in line with NR/L3/INV/3001 and NR/L3/OHS/0046, to identify root cause(s) and specify actions to prevent recurrence;

b) co-operate with any Network Rail or third-party investigation process and assist in the investigation, giving full access to all materials and information; and

c) support Network Rail in establishing the costs of the incident including, without limitation:

1) direct costs; and

2) indirect costs.

10 External benchmarking

10.1 Benchmarking environmental performance

An environmental performance assessment (design stage pre assessment) shall be undertaken prior to the selection of a single option for new construction and major refurbishment for operational property buildings.

NOTE 1: *BREEAM and CEEQUAL are independent environmental assessment tools recommended by Government for benchmarking environmental performance.*

NOTE 2: *It is anticipated that the expected environmental performance is remitted by sponsors at the outset of a project so opportunities to embed measures to mitigate negative environmental impacts are realised.*

NOTE 3: *Major refurbishments is defined as where the area of the building fabric being refurbished is greater than 50% of the surface of the individual element or 25% of the total building element.*

NOTE 4: *This would not be applicable for CEEQUAL Construction (only) or CEEQUAL Design & Construction if the scope of the assessment does not include single option selection.*

10.2 Operational Property enhancement - Refurbishment and fit-out

The Designer/Contractor shall meet RICS SKA environmental assessment method rating of ‘Silver’ as a minimum, and ‘Gold’ as an aspiration. Alternatively, the BREEAM Refurbishment & Fit-out environmental assessment scheme shall be used. Network Rail schemes shall achieve a ‘Very Good’ rating as a minimum requirement or ‘Excellent’ as an aspiration.

NOTE 5: *The clause applies to refurbishments and fit-outs where the area of the building fabric is greater than 50% of the surface of the individual element or 25% of the total building element.*

NOTE 6: *Design Guidelines can be found in NR/GN/CIV/400/05 – Workplace DNA*

10.3 Operational Property enhancement - new construction

Where the Project Sponsor/Third-party funder has remitted an independently assured environmental certification scheme such as BREEAM, the Designer/Contractor shall aim to achieve a ‘Very Good’ rating (as a minimum requirement unless specified otherwise) and ‘Excellent’ as an aspiration, where achievable in the context of minimising the whole life cost of Network Rail assets.

Where formal independent sustainability assessment is not required (e.g. non-critical line side buildings), the principles of BREEAM or another standard methodology such as Passivhaus shall be applied.

Ref:	**NR/L2/ENV/015**
Issue:	9
Date:	05 June 2021
Compliance date:	04 September 2021

10.4 Considerate Construction Practices

Where requested by the Employer's Representative, the Contractor shall achieve a Considerate Constructors Scheme (CCS) score of at least 35, with an aspiration and resource plan to score above 40.

10.5 External recognition (awards)

Where requested by the Employer's Representative, the Designer/Contractor shall seek recognition for sustainability achievements by entering external awards schemes in collaboration with Network Rail.

NOTE 7: *External award schemes could include Green Apple Awards, CIRIA Big Biodiversity Challenge, UK Rail Industry Awards, Rail Partnership Awards, Construction news Awards, and National Recycling Awards.*

Standard and control document briefing note

Ref: NR/L2/ENV/015	**Issue**: 9
Title: Environment and Social Minimum Requirements for Projects - Design and Construction	
Publication date: 05 June 2021	**Compliance Date:** 04 September 2021
Standard/Control Document Owner: Chief Environment & Sustainability Officer	
Technical lead/contact for briefings: Francesca Stainthorpe, Environmental Management Systems Manager, TA	**Tel:** 07701 069704

Purpose:
This standard sets out Network Rail's minimum requirements for the management of environment and social risks and opportunities during design and/or construction activities.

The implementation of this standard delivers a range of benefits to Network Rail including:

a) improved business cost-efficiency from sustainable practices, such as designing for whole-life energy efficiency, waste minimisation, and capital carbon value engineering;

b) increased social value created by maximising opportunities for inclusive design, considerate construction and socio-economic growth;

c) reduced risk of legal and regulatory non-compliance and negative reputational exposure by delivering good practice standards of environmental and social performance; and

d) alignment with the Network Rail Environmental Sustainability Strategy.

Scope:
This standard is mandatory for all construction and design works carried out by Network Rail and its contractors as part of a PACE managed project.

This standard applies to but is not limited to:

a) Designers/Contractors contracted to Network Rail for the provision of design and/or construction services;

b) Network Rail business units where they act as a design or contractor entity according to Construction (Design and Management) Regulations definitions, e.g. Network Rail Design Delivery and Works Delivery engaged in construction and design works; and

c) any non-construction works that comply with NR/L2/OHS/0044 – Planning & Managing Construction work.

This standard excludes any works associated with maintenance activities.

The requirements of this standard apply to all land areas impacted by project activities, including the primary development site(s) and, without limitation, any associated temporary work sites, compounds, haul roads, access routes.

Where a joint venture or alliance is established, this standard should be recommended as a minimum when defining contract requirements for those organisations accountable for design or construction within the alliance.

Overview of change

This standard has been updated as part of the Post-Implementation Review of the standard. The updates have been made in response to comments from stakeholders received during implementation of the standard. A detailed summary of the changes is available in the document attached to this briefing note.

Detail of change

Section(s)/clause(s)	Summary of changes
Please see attached 'Summary of ESR changes'.	

Reasons for change

In 2019, Environment and Social Minimum Requirements for Projects - Design and Construction [Issue 8]- went through a significant review and update process resulting in a number of new requirements for projects. Compliance with Issue 8 of the standard was by 31 December 2019 and this post-implementation review seeks to provide additional clarification and guidance where needed as raised by stakeholders. This review also seeks to align the standard with existing business process and strategy, and with updated legal requirements.

Affected documents:

Reference	*Impact*
NR/L2/ENV/015 ISSUE 8	Superseded

Briefing requirements:

Will Briefing Management System be used to deliver the briefing to posts listed below? No

Technical briefings are given to those who have specific responsibilities within this standard/control document.

Awareness briefings are given to those who might be affected by the content but have no specific responsibilities within the standard/control document.

Details of the briefing arrangements are included in the associated briefing programme.

All posts identified for briefing must be as described in OrgPlus.

Roles are directly briefed and do not cascade briefings.

Summary of key changes to NR/L2/ENV/015
Environment and Social Minimum Requirements for Projects – Design and Construction

Purpose of this document:

This document has been prepared to assist stakeholders and users of NR/L2/ENV/015 understand the key changes made to the standard as part of the Post-Implementation Review (June 2021 - Issue 9).

This document summarises the key changes that have been made in simple terms. It is not intended to be read in isolation, and the reader should refer to the standard to understand all of the changes in further detail and within context.

General document information:

- **Amended:** Issue number changed from 8 to 9
- **Amended:** Compliance date amended: 04th September 2021
- **Amended:** Technical lead and approval signatures updated

Reference Documentation:

- **Added:** The following documents have been added to the reference documentation list:
  - NR/L3/ENV/044: Used Ballast and Excavation Waste Handling
  - NR/L2/ENV/121: Managing Environmental and Social Impacts of Noise and Vibration
  - NR/L2/ENV/120: Waste Management
  - NR/L2/ENV/123: Prevention of Pollution to Land and Water
  - NR/L3/OHS/0046: The Reporting, Investigation and Recording of Safety and Sustainable Development Events and Close Calls within Infrastructure Projects
  - NR/L2/MTC/089: Asset Management Plan Forms
  - NR/L2/ENV/122/01: Management of Biodiversity
  - NR/L3/TRK/003/TEF3069: Pesticide application record form
  - NR/L2/SCO/306: Disposal of redundant assets
  - NR/L2/SIG/11201/Mod A2-23: Recovery of redundant assets [Issue 1]
  - NR/L2/CIV/003/F004: Architectural and Layout Acceptance form
  - NR/L2/OPS/250: Network Rail National Emergency Plan
  - NR/L3/OPS/045/4.14: Control of Emergency Incident Procedures
  - NR/L3/MTC/MG0197: Power Supply Outage Management
  - NR/L2/P3M/201: Project Acceleration in a Controlled Environment (PACE)
- **Removed:** Standards that have been withdrawn/ superseeded have been removed (NR/L3/INV3001/RIM101, NR/L3/INV/3001/RIM101, NR/L3/INV/3001/RIM113).

Legislation:

- **Amended:** The wording has changed from listing what legislation the standard complies with to state that the standard 'Complies with relevant environmental and social legislation at the time of publication.'

- **Removed:** The examples of legislation that the standard complies with have been removed
- **Added:** A reference to Network Rail's Legal Register has been added.

Contents:

- **Added:** A new section has been added titled 'Emergency works and urgent reactive works.'

Purpose:

- **Added:** Reference to the Network Rail Environmental Sustainability Strategy.

Scope:

- **Amended:** The scope has been updated to PACE managed projects from GRIP (references to GRIP have been updated throughout the standard to align to PACE).
- **Added:** NR/L2/OHS/0044 - Planning & Managing Construction work has been added as an example when the standard applies.
- **Amended:** Wording amended that the standard excludes 'works associated with maintenance activities' from 'works carried out for/on behalf of Regional maintenance teams.'

Definitions:

- **Amended:** Definitions have been removed that are not referenced in the text (e.g. Controlled Waters), and other definitions have been added that are referenced in the text (e.g. Circular Economy, non-construction works).

Section 4 - Environmental and Social Management Processes

4.1 Environment and Social Appraisal (ESA)

- **Amended:** Text added to state that the ESA shall be completed at the start of the project and is a mandatory PACE product to be updated at each PACE milestone or when significant changes to the project occur.
- **Amended:** Section updated to make reference to PACE from GRIP.
- **Added:** Text to confirm that it is the Project Manager's (PM) responsibility for ensuring the ESA is complete and accurate.
- **Added:** Text added - Employer's Representative to ensure the Designer/Contractor has access to the ESA.
- **Amended:** Note has been updated with further guidance on the use of the ESA.

4.2 Environmental and Social Management Plans (ESMP)

- **Added:** A note has been added to cover over-arching ESMP's for alliance and contractors for repeating works.
- **Added:** Clarification added that environment and social risk assessment shall be populated at the start of the project.
- **Added:** Design ESMPs to be submitted at a date agreed by Employer's Representative.
- **Amended:** Previous note has been updated from a green to an amber requirement that formal acceptance of the ESMP is through the completion of EN3 Review and Acceptance Form completed by the PM.
- **Added:** Note added that EN3 is a PACE product within the PACE Product Index.

Section 5 - General Requirements – all projects/works

- **Amended:** Section re-ordered, and new section added (Network Rail policies and strategies)

5.1 Network Rail policies and strategies

- **Added:** 5.1 is a new section
- **Added:** Requirement added - Designer/Contractor to comply with NR policy, strategy and standards.

5.2 Roles and Responsibilities

- **Added:** Note added to reference Appendix E of the Principal Contractor Licensing Scheme NR/L2/INI/CO0070.

5.3 Competence

- **Added:** Requirement to use a competence framework**.**

5.4 Sub-contracting

- No changes.

5.5 Permits, Licenses and Consents (PLCs)

- **Added:** Note added to reference Land and Consents Strategy and Commitments Register.

5.6 Objectives, targets and performance indicators

- **Added:** Requirement for Designer/Contractor to progress social performance commitments made in the procurement and contracting process.
- **Amended:** Text updated to reference 'national and local' KPIs.

5.7 Life Cycle Costing (LCC) and Option Selection

- **Amended:** Title updated from 'Whole-life cost analysis' to 'Life Cycle Costing (LCC) and Option Selection.'
- **Added:** Further details as to when LCC should be undertaken, and by who. This includes LCC test at strategic development phase and LCC comparison at the project selection phase.
- **Added:** Note added to reference the LCC handbook, and that the sponsor may request LCC analysis at project development phase.
- **Added:** Requirement that the Option Selection process includes environmental and social considerations.
- **Added:** Requirement to undertake a Workshop/ review to identify and assess design options.
- **Added:** Requirement added that contractors should apply these principles during the delivery phase.
- **Amended:** Note updated to provide further information on Environmental Life Cycle Appraisal methodologies.

5.8 Communication

5.8.1 Stakeholder Management Plan

- **Added:** 5.8.1 is a new section.

- **Amended:** Requirement for Designer/Contractor to identify a list of stakeholders and appropriate methods of engagement (previously requirement under 7.1 Being a Caring Neighbour).
- **Added:** A note has been added providing guidance on possible stakeholders.

5.8.2 Internal Communication

- **Amended:** Environment and Social Performance Policies shall be made available to interested parties (this requirement was previously to display on notice boards in fixed and temporary locations)
- **Added:** Requirement for Designer/Contractor to maintain records of all briefings and communication activities.

5.8.3 External Communication

- **Added:** 5.8.3 is a new section
- **Amended:** The previous section 5.7.3 of Issue 8 of ESR 'Communication with Statutory Authorities and Non-Governmental Organisations' has been incorporated into this section.
- **Amended:** The distance that the Designer/Contractor must inform local community relations representative(s) has been updated from 150metres to 200metres. For noisier works, this distance has been updated to 500m.
- **Added:** A note has been added that noisier works will be defined as the output of the Noise and Vibration Risk Assessment.

5.8.4 Communication between Network Rail and Suppliers

- **Amended:** A discussion of Opportunities have been added to progress meetings between the Employer's Representative and the Designer/Contractor.

5.9 Monitoring and Assurance

- **Added:** A requirement has been added that the NR PM shall put in place a schedule of environment and social inspections.
- **Amended:** A timeframe of 28 days has been added to the Designer/Contractor providing copies of inspections and audits to the Employer's Representative.

5.10 Records, documents and knowledge transfer

- **Amended:** The list of what a Designer/Contractor must provide the Employer's Representative with has been updated to include 'Records – including consents, permissions, licences and monitoring records.'
- **Amended:** This list has also been updated to include responses and lessons learnt for environmental incidents.
- **Added:** A requirement for the PM or delegated representative to complete Asset Management Plan Forms at hand-over has been added. A note has been added to support this.
- **Amended:** Content from 'Updating the Hazard Directory Section 5.10.3' in Issue 8 has been moved to this section.

5.11 Environment and Social data Sources

- **Added**: 5.11 is a new section heading that incorporates the information from the 'National Hazard Directory' in Issue 8 of ESR.
- **Added**: 3 notes have been added on guidance for accessing external and internal data sources, and further information on The National Hazard Directory.

5.11.2 Using data from External records

- **Added:** Requirement added that the Designer/Contractor must verify the validity of external data sources.
- **Added:** Note added that the absence of previous environmental or social records does not mean constraints are not present.

5.12 Health and Safety File

- **Added:** Clarification that environmental information shall be submitted to the Employer's Representative.

5.13 Tax allowances and rebates

- **Amended:** Reference to Enhanced Capital Allowance schemes has been removed.

Section 6 Environmental Requirements

6.1 Biodiversity

- **Added:** Requirement that works follow the processes outlined in NR/L2/ENV/122/01- Management of Biodiversity standard.
- **Amended:** Reference to 'Biodiversity Calculator' has been altered to a reference to 'biodiversity metric calculations'.
- **Added:** Requirement for all ecology related outputs to be provided to NR in the format requested within 7 days of receipt (by Designer/Contractor).

6.2 Contaminated Land

- **Added:** Requirement for Designer/Contractor to conduct an Initial Hazard Review to determine whether a Preliminary Risk Assessment is required.
- **Added**: Details of PRA requirements – including conceptual site model and pollution linkages.
- **Added**: A note has been added referring to the Contaminated land guidance note available on Safety Central.
- **Added:** A note has been added to signpost guidance on Land Contamination Risk Management which should be followed in site assessments.
- **Added**: A requirement to conduct a Generic Quantitative Risk Assessment if required.
- **Added:** Requirement for Optional Appraisal and remediation and verification considering significant risks to be undertaken if required.
- **Added**: A requirement to comply with NR/L3/ENV/044 – Used Ballast and Excavation Waste Handling.

6.3 Emissions to Air

- **Added**: Requirement that the contractor shall confirm emissions to air are reduced to ALARP during construction (including a consideration of Non-Road Mobile Machinery).

- **Added**: Requirement for Designer/Contractor to provide information on emissions to air to Asset Manager on completion of the works and include in the Health & Safety File.

6.4 Energy and Carbon

6.4.1 Managing Carbon in Infrastructure (PAS 2080)

- **Amended:** Wording updated for NR PM to achieve collaboration between all value chain participants.

6.4.2 Whole Life Carbon

- **Amended:** Whole life Carbon has been renamed – previously 'Capital Carbon.'
- **Added:** Requirement added for consequential impacts on aggregated carbon emissions on modular stages of asset life cycle (through entire project life span) to be considered to reduce whole life carbon emissions.
- **Added:** Note added to clarify that the principle of whole life carbon management applies to all projects.
- **Amended:** Clarification provided for what works should use the Rail Carbon Tool (to include civil, mechanical or electrical engineering) and what should be considered.
- **Added:** Note added to provide further detail on exceptions for using the Rail Carbon Tool - including complex componentry asset systems (e.g. signalling and telecoms).
- **Added**: Requirement for the contractor to utilise renewable energy power and energy efficient technologies during construction activities.
- **Added:** Note added regarding training on the Rail Carbon Tool.

6.4.3 Energy and operational carbon

- **Added:** Requirement for Designer to propose options for energy efficiency.
- **Added:** Requirement for design to utilise thermal storage, heat recovery, free cooling, renewable energy or natural lighting where practicable.
- **Added:** Requirement for Energy Performance Certificate (EPC) rating of C or above for all new buildings and E for modified buildings for leased buildings.
- **Added:** Reference to the requirements regarding connections and disconnections process as stipulated in NR/L3/ENV/305.
- **Added:** Reference that new connections shall be sub-metered.

6.5 Circular Economy

- **Added**: 6.5 is a new section and includes sub-sections of Materials and Waste.

6.5.1 Circular Economy Principles & Resource Efficiency

- **Added:** 6.5.1 is a new sub-section.
- **Added**: Requirement that the Designer/Contractor shall incorporate the principles of circular economy.
- **Amended:** The previous requirement to conduct a Resource Efficiency Assessment/ Workshop (previously in the waste section) has been moved to this section.
- **Amended:** The scope of the Resource Efficiency Assessment/ Workshop has been widened to also include carbon and water use.

- **Amended:** The requirements of the Resource Efficiency Assessment/ Workshop have been updated to include a review of opportunities to reuse materials.
- **Added**: A note has been added that the Resource Efficiency Assessment/ Workshop could be incorporated into other design reviews, meetings or assessments.
- **Added**: A note that SURPLUS can be downloaded from the NR App Catalogue has been added.
- **Added**: A note has been added that Circular Economy Principles will be met by following other sections of the standard (e.g. Life Cycle Costing).

6.5.2 Materials – responsible sourcing

- **Added:** 6.5.2.1 is a new sub- section.
- **Added:** Requirement for Designer/Contractor to identify opportunities for materials with low environmental and social impact aligned with NR's Environmental Sustainability Strategy; in design and procuring materials for works.
- **Added:** Note referencing NR's Environmental Sustainability Strategy on Safety Central.

6.5.2.2 Low environmental impact products

- **Amended:** Requirement to identify materials with negative environmental or social impacts during production, transport, installation, use, decommissioning, and deconstruction.
- **Added:** Note added for assessment of products/ materials to include information from EPDs or Safety Data Sheets.

6.5.2.3 Responsibly sourced timber

- **Amended:** Requirement for all timber and timber derived products sourced by NR and supply chain to be from legal and sustainable sources which are credibly certified by a third party and hold full documented chain of custody (this updates from the previous requirements for FSC or PEFC certified timber).
- **Added:** Note added referring to NR's Responsible Timber Sourcing Policy on Safety Central.
- **Amended:** Collation and submission of timber consignment data at the request of the Employer's Representative (previously the requirement was to submit timber consignment data quarterly).

6.5.2.4 Concrete and aggregates

- **Amended:** Removal of requirement for works in excess of 50 tonnes to identify the type and quantity of concrete and aggregate to the used.
- **Added:** Requirement for concrete/aggregates to be responsibly sourced.
- **Added:** Requirement to utilise a whole-life carbon approach in material selection.
- **Added:** Note referencing how to procure NR SCO's recycled aggregate products.

6.5.2.5 Herbicides

- **Amended:** Reference to 'Herbicide' Agreement on Safety Central (previously Pesticide Agreement).
- **Added:** Requirement to consider seepage to watercourses.
- **Added:** Requirement for person with BASIS certification to specify treatment methodology.
- **Added:** Note added to consider non-chemical methodologies in first instance.
-

- **Added:** Requirement for competent person to select herbicide type and dosage rates prior to work commencing.
- **Added:** Note added as to what constitutes competency: NPTC PA1 and NPTC PA6.
- **Added:** Requirement for advance provision of proposed locations of application to operator
- **Added:** Requirement to complete NR/L3/TRK/003/TEF3069 – Pesticide Application Record Form.

6.5.3.1 Waste Management

- **Added:** A requirement to comply with the waste standard - Waste NR/L2/ENV/120.
- **Amended:** Clarification is provided for design and construction Site Waste Management Plans (SWMPs) and what to include – including a requirement for it to be updated throughout the project.
- **Amended:** The Resource Efficiency Workshop has been moved to the Circular Economy section.
- **Added:** A note has been added to reference the Disposal of Redundant Assets Standards – NR/L2/SCO/306 and NR/L2/SIG/11201/Mod A2-23.
- **Added:** A note has been added to reference NR/L3/ENV/044 – Track Maintenance – Used Ballast and Track Excavation Waste.

6.5.3.2 Polychlorinated bi-phenols (PCBs)

- **Added**: 6.5.3.2 is a new sub-section.
- **Added:** Requirement for the Employer's Representative to identify PCB contaminated equipment and assets.
- **Added:** Requirement for equipment and assets to be tested, registered, and disposed of in accordance with legal requirements.
- **Added:** Note added that NR maintains a PCB register of known E&P assets.
- **Added:** Note added that a PCB Checklist is available on Safety Central.

6.6 Noise & Vibration

- **Added**: Requirement to comply with Managing Environmental & Social Impacts of Noise and Vibration - NR/L2/ENV/121.
- **Added:** Requirement to conduct a Noise and Vibration Risk Assessment as required by NR/L2/ENV/121.
- **Added:** Note that a Noise and Vibration Risk Assessment template is available on Safety Central.
- **Added:** Requirement to consider where site access compounds are located.
- **Amended:** Requirement for Contractor to implement measures to control noise and vibration using BPM to levels ALARP (previously the requirement was to design measures).

6.7 Dust, odour and lighting

- **Added:** 6.9 is a new section. The content has been merged from the previous 'Noise, nuisance, and disturbance' section.
- **Added:** Requirement for design to control intrusive lighting emissions in addition to control of dust and odour emissions from fixed plant or temporary plant and site activities.
- **Added:** Requirement for contractor to consider the impacts of traffic.

6.8 Pollution of land/water

- **Amended:** Text updated to include a requirement for Designer/Contractor to put in place measures to reduce risks/ pollution pathways to ALARP following the risk assessment (the previous requirement was to assess risks and pollution pathways only).

6.9 Sustainable travel

- **Added**: Requirement to consider the Sustainable Travel Hierarchy, and to use low emission vehicles for on-site use.

6.10 Water

- **Amended:** Requirement for Designer/Contractor to identify water reduction initiatives.

6.11 Weather Resilience and Climate Change Adaptation (WRCCA)

- **Amended:** Requirement for Designer to identify the potential for weather events to impact assets and the area surrounding the project defined as 'Weather and Climate Change Impact Assessment.'
- **Amended:** Section re-ordered to include requirements for undertaking a Weather and Climate Change Impact Assessment.
- **Added**: Note added that guidance on how to undertake a Weather and Climate Change Impact Assessment report is available on Safety Central, and that the PM is responsible for approval.

7 Emergency works and urgent reactive works

- **Added:** Section 7 is a new section.
- **Added**: Requirement to implement measures to minimise environmental and social risks during emergency and urgent reactive works.
- **Added**: Note added that following completion of emergency and urgent reactive works - usual Network Rail standards and legal requirements shall be followed.

8. Social Performance Requirements

- **Amended:** The order of section 8 has been updated.

8.1 Approach to Social Performance

- **Added:** Guidance added for Designer/Contractor to conduct a workshop on social performance to plan approach to social performance note (This is a green requirement and considered guidance/best practice).
- **Added:** A note has been added stating the social workshop can be integrated into other existing workshops and does not need to be stand-alone.
- **Added:** Requirement added that approach to social performance integrated into ESMP, and includes a list of requirements (including risks/ opportunities, objectives and targets, KPIs, how risks will be managed, and how workers will be trained).

8.2 Being a caring neighbour

- **Added:** Requirement for Designer/Contractor to manage/ mitigate risk of disturbance to passengers, lineside neighbours and local communities.
-

- **Amended:** The distance that the Designer/Contractor must inform local community relations representative(s) has been updated from 150metres to 200metres (for noisier works, this distance has been updated to 500m).
- **Added:** Note added to reference the Noise and Vibration Risk Assessment template.
- **Added:** Requirement for Designer/Contractor to participate in stakeholder consultation organised by the Employer's Representative.
- **Amended:** Requirement for consideration to be given to worker behaviour.

8.3 Connecting communities with the environment

- No changes

8.4 Creating engaged employees and positive industry partnerships

- **Amended:** Wording updated for the Designer/Contractor to implement an approach to manage risk of modern slavery that is aligned to NR's anti-slavery and human trafficking policy.
- **Added:** Requirement for Designer/Contractor to support the physical and mental health and well being of workers (e.g. through fatigue management).

8.5 Inspiring tomorrow's workforce

- **Amended:** Requirements for Employment and Skills assessment to include early engagement (e.g. school visits), Level 2,3 and 4 apprenticeships, and the development of skills of current workers.
- **Added**: Note added referring to Employment and Skills Assessment Template on Safety Central.

8.6 Keeping communities safe

- **Amended:** Requirement to contact the Suicide Prevention Team before starting work to understand if it's an area of concern.
- **Added:** In areas of concern, staff to be issued with the Suicide Prevention Handbook
- **Added:** Note added on how to access suicide prevention materials and learning tool videos.

8.7 Making rail a great experience

- **Added:** Note added stating NR has established an independent Design Advisory Panel to review design impacts of projects on passengers, communities and the environment.
- **Added:** Reference to the Design Advice Project Guidance NR/GN/CIV/100/01 added.

8.8 Making travel accessible and inclusive

- **Amended:** Heading updated to include 'and inclusive.'
- **Amended:** Requirement for a Diversity Impact Assessment (DIA) to be completed by the Employer's Representative now a red, mandatory requirement. Requirement includes a list of what the assessment must include as a minimum.
- **Added:** Requirement for the Designer/Contractor to collaborate with the Employer's Representative to inform the DIA.
- **Added**: Note added stating location of DIA templates on Access and Inclusion SharePoint site.
- **Added:** Requirement for DIA to be reviewed at every PACE milestone.

- **Added:** Note of protected characteristics added.
- **Added:** Requirement for the Designer/Contractor to engage with NR's Built Environment Advisory Panel if requested.

8.9 Respecting cultural heritage and rail history

- **Added:** Requirement for architecturally significant schemes requiring planning consent or listed building consent to request architectural layout acceptance by submitting NR/L2/CIV/003/F004.
- **Added:** Notes have been added providing guidance on the Design Advisory Panel (DAP) and guidance notes on Heritage, Care and Development.

8.10 Supporting Britain's economic development

- **Amended:** Requirement to utilise procurement processes that enable qualified and experienced suppliers or sub-contractors to compete fairly and freely (e.g. SMEs, local businesses, VCSEs).
- **Amended:** Best practice/ voluntary Requirement for Designer/Contractor to provide at least 2 business groups with opportunities for compete for contracts (note this is a green requirement and considered guidance/best practice).
- **Amended:** Best practice/ voluntary requirement for job opportunities to be posted locally e.g. in the same local authority as works.
- **Added:** Best practice/ voluntary requirement for Designer/Contractor to pay workers the Real Living Wage in delivery of NR contracts.

9 Incident Management

9.1 Incident Response

9.1.1. Incident Response Plan (IRP)

- **Amended:** Requirement added that IRP shall include procedures for responding to unexpected finds (e.g. protected species).
- **Amended:** Requirement for reporting of environment and social incidents to be in accordance with NR/L3/OHS/0046.
- **Amended:** Withdrawn standards have been removed from the list.
- **Amended:** Requirement to complete Report and Investigation Form (Level 1) updated for Category 1,2 and 3 incidents (previous no mention of categories).

9.1.2 External Reporting

- **Amended:** Reference to 'Nature Scot' from Scottish Natural Heritage.
- **Added**: Requirement for external contractors to liaise with the Employer's Representative to agree comms with the relevant regulator.

9.2 Incident Investigation

- No changes

10. External benchmarking

- New sections created within this section (detailed below).

10.1 Benchmarking environmental performance

- **Amended:** Requirement to undertake an environmental performance assessment prior to the selection of a single option (for new construction and major refurbishments for operational property buildings).
- **Added:** Notes added providing guidance on the use BREEAM and CEEQUAL and the above would not be applicable for CEEQUAL Construction (only) or CEEQUAL Design & Construction if the scope of the assessment doesn't include single option selection.
- **Added:** Note that expected environmental performance is remitted by sponsors at project outset.

10.2 Operational Property enhancement- Refurbishment and fit-out

- **Added:** 10.2 is a new sub-section.
- **Added:** Requirement that the Designer/Contractor shall meet RICS SKA rating of 'Silver' as a minimum and 'Gold' as an aspiration. Alternatively, where BREEAM is used, a rating of 'Very Good' is required and 'Excellent' is an aspiration.
- **Added**: Note added stating the clause applies to refurb and fit outs where the area of building fabric is >50% of surface of individual element or 25% of total building element.
- **Added**: Note added that design guidelines are available- NR/GN/CIV/400/05- Workplace DNA.

10.3 Operational Property enhancement- new construction

- **Added:** 10.3 is a new sub-section.
- **Added:** Requirement added that where the project sponsor/ third-party funder has remitted a certification scheme such as BREEAM, the Designer/Contractor shall achieve a 'very good' rating as minimum and 'excellent' as an aspiration.
- **Added:** Requirement that where formal sustainability assessments are not required, the principles of BREEAM or a similar methodology (e.g. Passivhaus) are applied.

10.4 Considerate Construction Practices

- **Added:** 10.4 is a new sub-section.
- **Added:** Requirement that where requested by the Employer's Representative, the contractor shall achieve a Considerate Constructors Schemes (CCS) score of at least 35, with aspiration to score above 40.

10.5 External recognition (awards)

- **Added:** 10.5 is a new sub- section.
- **Added:** Requirement for Designer/Contractor to seek recognition for sustainability achievements by entering external awards where requested by the Employer's Representative.
- **Added:** Note added - list of example award schemes e.g. Green Apple Awards.

1. INTRODUCTION

1.1 Transpennine Route Upgrade

1.1.1 The Transpennine Route Upgrade (TRU) is a major, multi-billion pound program of improvements to increase capacity, improve journey time and reliability performance of rail services on the Transpennine Route.

1.1.2 TRU will aim to deliver:

- An improved journey time for Leeds – Manchester Victoria of 42-44mins;
- An improved journey time for York to Manchester Victoria of 65-67mins;
- Capability to operate four ‘express’ and two ‘semi-express’ services an hour;
- Capability to operate up to two ‘local services’ an hour on the route;(subject to future operating timetables);
- Performance of the Transpennine Route to be 92.5% or higher each period;
- Larger freight containerisation capability (W12 gauge);
- Freight paths/rights to be retained as existing; and
- A contribution to Network Rail’s Decarbonisation Strategy and climate policy.

1.1.3 The Network Rail (Stalybridge to Diggle (Saddleworth) Enhancement Order extends from Stalybridge Tunnel, in the west, through to the western portal of Standedge Tunnel (the “Order Scheme”). This section of the Transpennine route follows the Tame Valley from Stalybridge to Diggle, and is referred to hereafter as Route Section W2B.

1.1.4 The TRU programme in Route Section W2B involves a variety of works including the electrification of the railway (installation of overhead line equipment (OLE) and associated infrastructure), reconstruction and modification of existing bridges to facilitate electrification of the railway, construction of a new station at Mossley, closure of Stockport Road Level Crossing and Moorgate Halt Level Crossing, railway works at Greenfield Station to support the upgrade and electrification of the railway track reconfiguration works and track lowering works through Stalybridge and Scout Tunnels.

1.1.5 Under the Planning (Listed Buildings and Conservation Areas) Act 1990, consent is required from the local planning authority for any proposed works that would affect the character of a listed building. The Transport and Works Act 1992 introduced section 12(3A) into the Planning (Listed Buildings and Conservation Areas) Act 1990, the effect of which is to "call-in" for determination by the Secretary of State applications to the local planning authority for listed building consent where such consent is required in consequence of proposals included in an application for a Transport and Works Act Order (TWAO). The procedures in the Transport and Works Applications (Listed Buildings, Conservation Areas and Ancient Monuments Procedure) Regulations 1992 then apply to the call in of such listed building consent applications.

1.1.6 This Heritage Statement has been compiled in support of an application for listed building consent by Network Rail in respect of the proposed works on the grade II listed Heyrod Hall Overbridge (MVL3/7) (NHLE 1449242). This bridge is located in the village of Heyrod (NGR SJ9720099786), approximately 1.6 km to the north-east of Stalybridge Station. A location plan is provided in Appendix A.

1.1.7 The Historic England list description (included in full in Appendix B) names the listed building as “Heyrod Hall Bridge.” Throughout this Heritage Statement the structure is referred to as “Heyrod Hall Overbridge” in line with Network Rail’s naming of the structure.

1.1.8 The preparation of this assessment has been informed by the Statement of History and Significance: West of Leeds (Alan Baxter Associates, 2024) and the Route-wide Statement of Significance (Alan Baxter Associates, 2019).

1.2 Scope

1.2.1 The requirement for assessment and its scope is guided by policy contained within the National Planning Policy Framework (NPPF, revised 2025) specifically paragraph 207 which seeks an assessment proportionate to the asset’s importance and sufficient to understand the potential impacts of development. The specific scope of this assessment is determined by Network Rail’s requirement to provide an objective assessment of the heritage value of assets that may be affected by the Order Scheme, and to Identify and discuss the heritage significance of the listed structure, including the contribution of setting.

- Present the design requirements of the Order Scheme at the structure.

- Present the process of development and optioneering which has led to the design proposal for the Order Scheme in relation to the structure.
- Identify the impacts of the design proposal on the significance of the structure, in the context of current national and local planning policy and guidance.
- Discuss any mitigation recommended in relation to the structure.
- Consider the public benefits to be gained from the Order Scheme weighed against the impact on the significance of the structure, in line with the NPPF and the Tameside Unitary Development Plan Written Statement, 2004 (Tameside Metropolitan Borough Council, 2004).

1.3 Current Condition

1.3.1 Heyrod Hall Overbridge (MVL3/7) is a mid to late 1840s masonry overbridge, designed by Alfred Stanistreet (A.S.) Jee for the Huddersfield & Manchester Railway, comprising a single segmental arched bridge carrying a short private lane over the Huddersfield & Manchester Railway line and providing access to Heyrod Hall (Insert 1-1 and Insert 1-2).

1.3.2 A detailed condition assessment of Heyrod Hall Overbridge (MVL3/7) was undertaken in April 2023 which found the bridge to be in generally fair condition with no signs of structural failure.

1.3.3 A small number of defects were noted including:

- Open joints and areas of spalling across the parapets, upper barrel haunches and wing walls (Insert 1-3);
- Masonry fractures and displacement; and
- General weathering and some open joints (Insert 1-4).

Insert 1-1 Low mileage (south-west) elevation of Heyrod Hall Overbridge (MVL3/7).

Insert 1-2 North-east elevation of Heyrod Hall Overbridge (MVL3/7).

Insert 1-3 Arch soffit of Heyrod Hall Overbridge (MVL3/7) showing open joints, weathering and spalling of stonework.

Insert 1-4 Weathering, and open joints on Heyrod Hall Overbridge (MVL3/7).

1.4 Summary of proposal

1.4.1 In order to achieve the TRU Programme objectives, electrification of the route is required. This would require alteration of a number of existing bridges, including Heyrod Hall Overbridge (MVL3/7) to accommodate Overhead Line Equipment (OLE). Following optioneering, it has been determined necessary to reconstruct Heyrod Hall Overbridge (MVL3/7) (option 3). These works would therefore enable implementation of the Order Scheme.

2. LEGISLATION & POLICY CONTEXT

2.1 Legislation

2.1.1 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) ("Act") governs the designation and works to listed buildings in England.

2.1.2 The Act states in s.1 (5):

In this Act *"listed building" means a building which is for the time being included in a list compiled or approved by the Secretary of State under this section; and for the purposes of this Act—*

a) any object or structure fixed to the building;

b) any object or structure within the curtilage of the building which, although not fixed to the building, forms part of the land and has done so since before 1st July 1948, shall be treated as part of the building.'

2.1.3 Under the Act, no one is permitted to undertake or cause to be undertaken any works that would affect the character of a listed building unless the works are authorised. Section 16 of the Act identifies that whether such works can be carried out is determined by the local planning authority or the Secretary of State:

1) 'Subject to the previous provisions of this Part, the local planning authority or, as the case may be, the Secretary of State may grant or refuse an application for listed building consent and, if they grant consent, may grant it subject to conditions.

2) In considering whether to grant listed building consent for any works the local planning authority or the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses.

3) Any listed building consent shall (except in so far as it otherwise provides) ensure for the benefit of the building and of all persons for the time being interested in it.'

2.1.4 In relation to the granting of listed building consent, Section 17 of the Act stipulates that conditions attached to listed building consent may include those with respect to:

a) ' the preservation of particular features of the building, either as part of it or after severance from it;

b) the making good, after the works are completed, of any damage caused to the building by the works; [and]

c) the reconstruction of the building or any part of it following the execution of any works, with the use of original materials so far as practicable and with such alterations of the interior of the building as may be specified in the conditions'.

2.1.5 It is also defined in s.17 (2) that a condition '*may also be imposed requiring specified details of the works (whether or not set out in the application) to be approved subsequently by the local planning authority or, in the case of consent granted by the Secretary of State, specifying whether such details are to be approved by the local planning authority or by him'*.

2.1.6 The Act also states in s.66 (1):

'In considering whether to grant planning permission or permission in principle for development which affects a listed building or its setting, the local planning authority or, as the case may be, the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses'.

2.2 National Policy

2.2.1 The NPPF sets out the Government's planning policies for England and how these should be applied to contribute to the achievement of sustainable development, supported by the Planning Practice Guidance on the Historic Environment (updated July 2019) (MHCLG, 2019).

2.2.2 Section 2 of the NPPF outlines the principles of achieving sustainable development including, in Paragraph 8, an environmental objective *'to protect and enhance our natural, built and historic environment'*. Paragraph 9 sets out that these objectives should be delivered through the preparation and implementation of plans and the application of the policies within the NPPF. Section 16

of the NPPF deals specifically with the historic environment. Where changes are proposed, the NPPF sets out a clear framework to ensure that heritage assets are conserved, and where appropriate enhanced, in a manner that is consistent with their significance.

2.2.3 This Heritage Statement aims to address relevant policy within the NPPF in relation to Section 16 'Conserving and enhancing the historic environment' and includes guidance on assessment of significance of the heritage assets and their setting that may be affected by the proposed works and how to consider potential impacts on significance.

2.2.4 The following paragraphs as set out in the NPPF include key provisions considered of particular importance to this application:

- Paragraph 207 – '*In determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand the potential impact of the proposal on their significance.'*

- Paragraph 212 – '*When considering the impact of a proposed development on the significance of a designated heritage asset, great weight should be given to the asset's conservation (and the more important the asset, the greater the weight should be). This is irrespective of whether any potential harm amounts to substantial harm, total loss, or less than substantial harm to its significance.'*

- Paragraph 213 – '*Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification. Substantial harm to or loss of:*

    a) grade II listed buildings, or grade II registered parks or gardens, should be exceptional;

    b) assets of the highest significance, notably scheduled monuments, protected wreck sites, registered battlefields, grade I and II listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional.'*

- Paragraph 214 – '*Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should*

refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss, or all of the following apply:

a) the nature of the heritage asset prevents all reasonable uses of the site; and

b) no viable use of the heritage asset itself can be found in the medium term through appropriate marketing that will enable its conservation; and

c) conservation by grant-funding or some form of not for profit, charitable or public ownership is demonstrably not possible; and

d) the harm or loss is outweighed by the benefit of bringing the site back into use.'

- Paragraph 215 – '*Where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate, securing its optimum viable use.'*

- Paragraph 216 – '*The effect of an application on the significance of a non-designated heritage asset should be taken into account in determining the application. In weighing applications that directly or indirectly affect non-designated heritage assets, a balanced judgment will be required having regard to the scale of any harm or loss and the significance of the heritage asset.'*

- Paragraph 219 - '*Local planning authorities should look for opportunities for new development within Conservation Areas and World Heritage Sites, and within the setting of heritage assets, to enhance or better reveal their significance. Proposals that preserve those elements of the setting that make a positive contribution to the asset (or which better reveal its significance) should be treated favourably.'*

Planning Practice Guidance

2.2.5 The Planning Practice Guidance (PPG) (MHCLG, 2019) provides further advice and guidance that expands the policy outlined in the NPPF. It expands on terms such as 'significance' and its importance in decision making. The PPG clarifies that being able to properly assess the nature, extent and the importance of the significance of

the heritage asset and the contribution of its setting, is very important to understanding the potential impact and acceptability of development proposals (paragraph 008 Reference ID: 18a-008-20190723).

2.2.6 The PPG states that in relation to setting, a thorough assessment of the impact on setting needs to take in to account, and be proportionate to, the significance of the heritage asset under consideration and the degree to which proposed changes enhance or detract from that significance and the ability to appreciate it (paragraph 009 Reference ID: 18a-009-20190723).

2.2.7 The extent and importance of setting is often expressed by reference to visual considerations. Although views of or from an asset will play an important part, the way in which an asset is experienced in its setting is also influenced by other environmental factors such as noise, dust and vibration from other land uses in the vicinity, and by our understanding of the historic relationship between places.

2.2.8 Paragraph 013 of the PPG recognises that the contribution that setting makes to the significance of the heritage asset does not depend on there being public right or the ability to experience that setting. When assessing any application for development which may affect the setting of a heritage asset, local planning authorities may also need to consider the implications of cumulative change (Paragraph: 013 Reference ID: 18a-013-20190723 Revision date: 23 07 2019).

2.2.9 In relation to substantial harm, the PPG states that 'it is the degree of harm to the asset's significance rather than the scale of the development that is to be assessed' (paragraph 017). Harm to heritage assets can be avoided or minimised if proposals are based on a clear understanding of the heritage asset and its setting (paragraph 008 Reference ID: 18a-008-20190723). The NPPF indicates that the degree of harm should be considered alongside any public benefits that can be delivered by development.

2.3 Local planning policy

Tameside Unitary Development Plan

2.3.1 The Tameside Unitary Development Plan (2004) is part of the statutory Local Plan policies for Tameside Metropolitan Borough which provides the set of planning policies which make up the current local plan.

2.3.2 The Tameside Unitary Development Plan sets out local planning policies that '*provide a framework for development and conservation over the whole of the Tameside area, to set out the main*

considerations on which planning applications in the Borough are determined, and to guide land use decisions by the Council and other agencies.'

2.3.3 Policies within the framework which are relevant to this Heritage Statement are outlined below.

Policy C Conservation and Enhancement of the Built Environment.

Policy C1 Townscape and Urban Form

In considering proposals for built development, the Council will expect the distinct settlement pattern, open space features, topography, townscape and landscape character of specific areas of the Borough to be understood, and the nature of the surrounding fabric to be respected. The relationship between buildings and their setting should be given particular attention in the design of any proposal for development.

Urban design frameworks will be produced for particular areas and corridors in the Borough, as supplementary planning guidance, setting out fundamental principles which should be followed and from which detailed design may be interpreted.

The Council will establish a strategy to secure the retention and enhancement of landmark buildings which form a distinctive element of the local skyline or townscape, and which represent a unique part of the heritage of the area. Re-use and conversion of such buildings which become redundant will be permitted, subject to other relevant policies.

Policy C5 Alternative Uses, Alterations and Additions for Listed Buildings

Whilst continuation of the use for which the building was designed is most desirable, the Council will permit alternatives uses for Listed Buildings where evidence demonstrates that the existing or original use is unlikely to support the maintenance and preservation of the building.

The Council will require that proposed new uses, or other alterations and additions to Listed Buildings, should not adversely affect the essential character of the building, should be in keeping with its architectural style and features, and should harmonise with its surroundings. The effect of the proposals on any protected species which may be using the Listed Building should also be taken into account.

Such development must be of a high standard of design. The external appearance, design and materials will be expected to match as near as possible those of the existing building and, where appropriate, new internal features should also harmonise with the existing.

Extensions and additions should be secondary in scale, design and location to the principal building and standard solutions or modern features which fail to relate to the character of the building will not be permitted

Policy C6: Setting of Listed Buildings

New development, including any proposed as a result of a new use for a Listed Building, which fails to preserve, or detracts from, the setting of a Listed Building or structure will not be permitted.

Policy C8 Demolition of Listed Buildings

The Council will not recommend the demolition of Listed Buildings, apart from in exceptional circumstances after the following considerations have been assessed:

(a) the condition of the building and the cost of repairing and maintaining it in relation to its importance and to the value derived from its continued use, and

(b) the adequacy of efforts that have been made to retain the building in its present use or to find compatible alternative uses, and

(c) *the merits of alternative proposals for the site.*

In such circumstances the Council will also need to be satisfied that an acceptable alternative form of development can go ahead on the site as soon as practical following demolition, that any use of the building by protected species has been taken into account, and that provision can be made to record the detail of the building prior to demolition.

Places for Everyone (Greater Manchester Combined Authority 2024)

2.3.4 Places for Everyone (Greater Manchester Combined Authority 2024) is a joint development plan covering nine Greater Manchester districts including Tameside, setting out a framework for sustainable development. Policy JP-P2 concerns Heritage and is of relevance to this assessment:

Policy JP-P2: Heritage

We will proactively manage and work with partners to positively conserve, sustain and enhance our historic environment and heritage assets and their settings. Opportunities will be pursued to aid the promotion, enjoyment, understanding and interpretation of heritage assets, as a means of maximising wider public benefits and reinforcing Greater Manchester's distinct character, identity and sense of place.

Local Plans will set out the key elements which contribute to the district's identity, character and distinctiveness and which should be the priority for conserving and enhancing in the future and demonstrate a clear understanding of the historic environment and the heritage values of sites, buildings or areas and their relationship with their surroundings. This knowledge should be used to inform the positive management and integration of our heritage by:

1. *Setting out a clear vision that recognises and embeds the role of heritage in place-making;*

2. *Ensuring that the heritage significance of a site or area is considered in accordance with national planning policy in the planning and design process and opportunities for interpretation and local engagement are optimised;*

3. *Integrating the conservation and enhancement of heritage assets and their settings, with creative contextual architectural responses that contribute to their significance and sense of place;*

4. *Delivering positive benefits that sustain and enhance the historic environment, as well as contributing to the economic viability, accessibility and environmental quality of a place, and to social wellbeing; and*

5. *Exploring opportunities to reduce greenhouse gas emissions that restoration of historic buildings offer.*

Particular consideration will be given to ensure that the significance of key elements of the historic environment which contribute to Greater Manchester's distinctive identity and sense of place are protected from harm. These include historic town centres, places of worship, historic transport routes including the canal network, industrial buildings and structures including textile mills, farmsteads and other sites, buildings, and areas of identified archaeological, architectural, artistic and/or historic value. Development proposals affecting designated and non-designated heritage assets and/or their settings will be considered having regard to national planning policy. Where heritage assets have been identified as being at risk,

Local Plans should identify specific opportunities for them to contribute to regeneration and place-making, and they should set out strategies for their repair and re-use. Development proposals which will help safeguard the significance of and secure a sustainable future for Greater Manchester's heritage at risk will be supported in principle, provided they are not contrary to national policy or other policies in the development plan. Proposals should be informed, as necessary, by the findings and recommendations of the appropriate heritage assessment(s) in the development plan evidence base and/or any updated heritage assessment submitted as part of the planning application process.

Historic England Guidance

2.3.5 Historic England has published a series of Good Practice Advice (GPA) notes and Advice Notes (AN) of which those of most relevance to this appraisal are GPA2 – Managing Significance in Decision-taking (Historic England, 2015), GPA3 – The Setting of Heritage Assets (Historic England, 2017), and AN12, Statements of Heritage Significance (Historic England, 2019).

2.3.6 GPA2 – Managing Significance in Decision-taking emphasises the importance of having a knowledge and understanding of the significance of heritage assets likely to be affected by the development and that the *'first step for all applicants is to understand the significance of any affected heritage asset and, if relevant the contribution of its setting to its significance'* (paragraph 4). Early knowledge of this information is also useful to a local planning authority in pre-application engagement with an applicant and ultimately in decision making (paragraph 7).

2.3.7 GPA3 – The Setting of Heritage Assets provides advice on the setting of heritage assets. Setting is as defined in the NPPF and comprises the surroundings in which a heritage asset is experienced. Elements of a setting can make positive or negative contributions to the significance of an asset and affect the ways in which it is experienced. Historic England state that setting does not have a boundary and what comprises an asset's setting may change as the asset and its surrounding evolve. Setting can be extensive and particularly in urban areas or extensive landscapes can overlap with other assets. The contribution of setting to the significance of an asset is often expressed by reference to views and the GPA in paragraph 11 identifies those views, such as those that were designed or those that were intended, that contribute to understanding the significance of assets.

2.3.8 AN12, Statements of Heritage Significance outlines a recommended approach to assessing the significance of heritage assets in line with

the requirements of NPPF. It includes a suggested reporting structure for a 'Statement of Heritage Significance', as well as guidance on creating a statement that is proportionate to the asset's significance and the potential degree of impact of a proposed development. The AN also offers an interpretation of the various forms of heritage interest that an asset can possess, based on the terms provided in the NPPF Glossary (Annex 2); namely archaeological, architectural, artistic, and historic.

3. ASSESSMENT METHODOLOGY

3.1 Research

3.1.1 In accordance with Historic England guidance and as determined by policy requirements, this assessment identifies the baseline heritage interest of Heyrod Hall Overbridge (MVL3/7). The historical narrative informing the baseline has been derived from a review of various resources including maps and other cartographic and photographic sources. Statutory information in relation to the designated assets has been obtained from the National Heritage List for England maintained by Historic England and the Historic Environment Record maintained by Greater Manchester Archaeology Advisory Service.

3.1.2 Additional information concerning the assets, their condition, use and setting has been obtained from a survey undertaken by suitably qualified and experienced heritage specialists on 21 and 22 May 2024.

3.2 Significance and setting

3.2.1 Assessment of the significance of heritage assets and their setting has been undertaken in consideration of guidance issued by Historic England. Significance is often established by statutory designations such as listed buildings, scheduled monuments and conservation areas. More particular advice as to what makes up significance is set out in AN12, which establishes a method for thinking consistently about the heritage values that can be ascribed to a place. When making an assessment of significance, numerous aspects are considered including architectural interest, historic interest, group value, social value, former uses and local distinctiveness. These aspects are grouped into four values defined in the NPPF as historical interest, archaeological interest, artistic interest, and architectural interest.

3.2.2 In assessing whether the setting of an asset contributes to its significance, and in assessing the effect of development, Historic England GPA3 provides a checklist of attributes that may affect setting and significance under five broad categories comprising:

- The location and siting of the development;
- The form and appearance of the development;
- Additional effects (change to skyline etc.);
- Permanence; and
- Consequential effects.

4. CONSULTATION

4.1.1 Historic England and Tameside Metropolitan Borough Council (TMBC) have been involved in ongoing stakeholder consultation with Network Rail through the development of Route Section W2B of the TRU.

4.1.2 Regular meetings with Historic England and TMBC have been held to discuss design development of the proposals in relation to Heyrod Hall Overbridge (MVL3/7). Initial meetings were held periodically throughout 2021 and resumed in 2024 to discuss the overall route and design development for all listed structures within Route Section W2B.

4.1.3 The design development of the Order Scheme in relation to Heyrod Hall Overbridge (MVL3/7) was discussed during meetings with the statutory stakeholders on the dates outlined in Table 4-1.

Table 4-1 Consultation for Heyrod Hall Overbridge (MVL3/7)

Date	Stakeholder in attendance	Key agreements/items discussed
2 March 2021	• TMBC	• An overview of the optioneering for each structure within the TMBC boundary was outlined by Network Rail. • The site constraints at Heyrod Hall Overbridge (MVL3/7) were presented, and the reconstruction of the bridge identified as the preferred option (option 3). The ambition to retain as much of the existing fabric as possible was also communicated to council officers.
26 May 2021	• Historic England • Oldham Metropolitan Borough Council	• Overview of the structures along Route Section W2B which are of historic interest, including the grade II overbridges and underbridges which are noted for their inherent significance, particularly as essential railway structures. Acknowledgement of their group value with each other was also presented as a key contributor to significance.

Date	Stakeholder in attendance	Key agreements/items discussed
	• Kirklees Council	• Presentation of the purpose of Heritage Statements and their assessment of impact with the emerging GRIP 3 designs. • Early-stage recommendations to minimise harm to significance against the requirements for justification of proposals and opportunities to pursue sensitive design and compensation. The proposed reconstruction of MVL3/7 was presented, due to the potential level of impact this structure was flagged as red on a RAG scale. • Reassurance was provided to the council that they would be involved in the GRIP 3 design process which would be used within the detailed design development of GRIP 4. Clarification was also provided on the sustainable heritage initiatives. • Historic England stated how they expect to get an understanding of significance at this stage and that they anticipate options to be shared for comment. Also stressed the importance of minimising harm.
2 February 2024	• TMBC	• This meeting was used to outline to members of the Local Planning Authority the significance of Heyrod Hall Bridge (MVL3/7), along with site specific constraints and the feasibility study of potential options. • The principle for reconstructing the bridge as the preferred option was established (option 1). • Discussion took place regarding the proposed form of the reconstructed deck, with a filler beam being the preferred option (option 3). • The options for parapet construction were presented, with a stone clad concrete core identified as the preferred option (option 3). The parapet height and form of coping stones were queried, with the rationale behind the 1.5 m parapet with triangular copers presented.

Date	Stakeholder in attendance	Key agreements/items discussed
6 February 2024	• Historic England	• Details of the challenges of the electrification of the route in relation to listed overbridges were presented. Design measures under consideration for addressing these challenges noted to include: Reduced voltage clearances - Development of scheme-specific pantograph, reducing electrical clearances to a minimum. - Site specific risk assessments of bridges due to reduced overhead wire heights. Electrical protection works - Risk-based approach to raising parapets. Where safe to do so, 1.5 m height parapets may be employed, rather than standard 1.8 m height. - This approach has been embedded in designs for W2B. • The design approach for electrification across / under existing railway bridges was noted to have agreed in principle by Network Rail and following consultation with the Local Authorities & Historic England at the preceding design stage. • The approach to bridge reconstruction was outlined, with key design aspects discussed including: - Retention of existing approach walls; - Visibility of new concrete elements to be minimised through the use of masonry cladding; - Stringcourse detail incorporated into the form of the edge beam; - Reclaimed stone used to clad interior of parapet, natural stone used to clad exterior; - Coursing of cladding to tie in with existing stonework as far as reasonably practicable; and - Where reclaimed stone cannot be reused, natural stone of matching size and colour would be used. • Confirmation that the design optioneering would be undertaken in consultation with Historic England.

Date	Stakeholder in attendance	Key agreements/items discussed
5 March 2024	• Historic England	• The significance, site constraints and optioneering process for Heyrod Hall Bridge (MVL3/7) were presented to Historic England. • Network Rail's preferred option for a bridge reconstruction (option 3) was recognised by Historic England along with the constraints relating to the other presented options.
07 May 2024	• Historic England	• Agreement in principle with Historic England on the principle of reconstruction at Heyrod Hall Overbridge (MVL3/7). • A formal letter capturing Historic England's pre-application advice for this structure was requested (received 25 June 2024) (see Appendix C for full letter).
24 May 2024	• TMBC	• This meeting was used to outline to members of the Local Planning Authority (following changes in personnel) the significance of Heyrod Hall Overbridge (MVL3/7), along with site specific constraints and the feasibility study of potential options. • TMBC expressed a preference for the continuation of stone cladding on the underside of the bridge, the retention of as much material as possible, and for the scope of works to the listed structure to be minimised as much possible.
25 June 2024	• Historic England	• Pre-application advice letter from Historic England identifies that the reconstruction of MVL3/7 would result in substantial harm to the significance of the bridge (see Appendix C for full letter). • Historic England summarised that substantial harm would arise from the loss of the form of the arched bridges and through the loss of historic fabric, with additional harm identified to the group value of the bridges. • It was agreed that reclaimed stone should be focussed on the inside faces of the parapet to

Date	Stakeholder in attendance	Key agreements/items discussed
		minimise the degree to which the alteration of the bridge is experienced from the deck. • Historic England concluded that it would be for the decision taker to weigh the balance of the identified substantial harm against the public benefit of the Order Scheme.
8 July 2024	• TMBC	• Written response from TMBC on proposed alteration of listed railway bridges identifying the following requirements: - Proposed works to listed bridges should be kept to the minimum necessary to facilitate the Order Scheme and ensure their continued use and enjoyment, whilst retaining as much as practicable of their individual character and appearance. - Any replacement stonework and/or new stonework (copings, for example) should be in natural stone. - Internal elevations of the bridge should be 'clad' or constructed with natural stone. - All new stonework at bridge level should respect the colour, texture, form to the existing and follow the same coursing pattern. - Any application for listed building consent should be supported by a Heritage Statement prepared in accordance with the NPPF. • listed building consent drawings to clearly identify on plan and in a methodology / specification details of works including repair work, fencing, and the extent of reconstruction of MVL3/7 and MVL3/20.
27 August 2024	• Historic England	• This meeting was used to present the draft listed building consent drawings to Historic England and to discuss the proposals presented in the drawings. • The design team confirmed that natural stone would be used for the cladding and coping of the proposed concrete elements (other than the edge beam which needs to be visible for inspection). Efforts would be made to tie the coursing of cladding in with the

Date	Stakeholder in attendance	Key agreements/items discussed
		retained sections as best as possible, informed by point cloud data held for the existing structure. • There was discussion of potential methodology for bridge demolition and how this may impact on the level of masonry able to be salvaged.
3 September 2024	• TMBC	• Discussion around draft LBC drawings for MVL3/7 and further conversation around the use of stone cladding. The use of stone cladding was confirmed to only be used for re-cladding and/or decoration as it would be a safety risk to use stone for structural components. Similarly, it was explained that the use of stone cladding on the concrete deck would pose significant maintenance issues with the risk of stone breaking off the structure and onto the railway. • Discussion around the shape of the bridge copers with concerns from the council that they would be very tall and angular. The designs confirmed that these would not be as tall and be much softer visually and will be proportionate.
3 September 2024	• TMBC	• Discussion around draft LBC drawings for MVL3/7 which demonstrate the worst case scenario for the extent of demolition, and conversation about the use of repurposed stone from the demolition of MVL3/23. The council was in support of the use of reclaimed stone where possible and queries whether it could be used on the concrete deck in which concerns over maintenance and technical justification as to why this would not be undertaken. • The council raised concerns over the height of the copers similar to those at Ashton. However it was reassured that the design for the copers would not be as tall with a proportionate ratio to the wall height.

Date	Stakeholder in attendance	Key agreements/items discussed
17 September 2024	• Historic England	• In their pre-application advice letter Historic England confirmed demolition and reconstruction of Heyrod Hall Overbridge (MVL3/7) would result in substantial harm to the significance of the bridge (Appendix C). • Careful retention and reuse of stonework for reuse in order to reduce harm was highlighted. Where new stone is required, it was noted that this should be as close a match as possible to the original fabric. • Coursing should match existing fabric to minimise the visual impact of the works. • The use of natural stone cut copers was welcomed.
28 March 2025	• TMBC	• Consultation to go over the draft Heritage Statements. Comments raised, during this meeting and have since been actioned include: - Request for inclusion of Historic England feedback in appendix to the Heritage Statements - Request for condition surveys subject to Network Rail's approval • Request for further emphasis of public engagement in the reports
4 April 2025	• Historic England	• Overview of draft comments from Historic England. Request to draw out the heritage interpretation in the reports as part of the heritage benefits.
18 July 2025	• Historic England	• Pre-application advice letter received from Historic England providing overarching feedback on proposals affecting listed bridges between Stalybridge and Standedge Tunnel (see Appendix C). • Acknowledgment given to the collaborative approach taken at pre-application stage, to fully explore alternative options to reconstruction and for the opportunity for Historic England to feed into design plans.

Date	Stakeholder in attendance	Key agreements/items discussed
		• The heritage statements adjudged to be well considered with clear justification having been provided for the substantial harm identified to those structures proposed for removal or reconstruction. • The inclusion of interpretation at Greenfield Station is welcomed by Historic England.

5. HERITAGE ASSSETS AND THEIR SIGNIFICANCE

5.1 History of the W2B Transpennine Route

5.1.1 The railway connecting Stalybridge to Huddersfield, which runs under Heyrod Hall Overbridge (MVL3/7) was constructed by the Huddersfield & Manchester Railway Company between 1846 and 1849. The mid-1840s was a period of commercial confidence and massive expansion in the railway network across England, known as 'Railway Mania' which has been described by Historic England as the Heroic Age (1841-1850) of railway building (Historic England 2017b). Between 1845 and 1852 the railway network expanded from 2,345 miles to 7,272 miles (3774 km to 11,703 km) (Alan Baxter Associates 2019). Constructed at the height of this boom, the Stalybridge to Leeds line was a product of this trend. Traversing a challenging landscape through the Pennines, the line was planned to follow the route of the Huddersfield Narrow Canal for much of its length, with the canal acquired by the Railway Company the year after its authorisation (Alan Baxter Associates 2019). These difficult landscape conditions resulted in the need to build several major viaducts and tunnels. These included Standedge Tunnel through the Pennines, which was constructed alongside the 1811 canal tunnel and is 'indisputably significant as a major engineering achievement' (Alan Baxter Associates 2024).

5.1.2 The development and expansion of the railways during the 19th century transformed the landscape and settlements through which they passed, fuelling industrial growth and settlement expansion. The impact of improved communications, first with the arrival of the canal in 1811, and then the railway in 1849, provided valuable links with Huddersfield, Manchester and Leeds, enabling import of raw materials and export of manufactured goods. This fuelled the gradual industrialisation and settlement expansion along the Tame Valley. This can be seen on historic Ordnance Survey maps dating from the 19th and early 20th century where industrial development including mills, dyeworks, printworks and quarries, is shown to have been present along the route of the railway and extending into the more

upland areas around Saddleworth and Harrop Dale, whilst settlements such as Mossley and Dobcross gradually expanded.

5.1.3 Heyrod Hall Overbridge (MVL3/7) was constructed for the Huddersfield & Manchester Railway Company in the mid to late 1840s. The principal engineer for the Huddersfield & Manchester Railway was Alfred Stanistreet (A. S.) Jee (1816–1858), who was assisted by the more renowned engineer Joseph Locke (1805–1860). Jee's work on the Huddersfield & Manchester Railway represents, arguably, his greatest achievement. This can be seen particularly in the construction of the Standedge Tunnel, which at over three miles long was one of the longest and most difficult in England, but also through the various large-scale viaducts along the route. In the 1850s, he worked internationally on the Spanish line from Alar-del-Rey to Reynosa where his skill in design, his accuracy and his completeness of the details earned him high praise (Institution of Civil Engineers: Obituaries, 1859). He died in a fatal accident upon the opening of the second portion of that line.

5.1.4 In 1847, prior to the opening of the line, the Huddersfield & Manchester Railway Company was taken over by the London and North Western Railway (LNWR). As part of the LNWR network, the Huddersfield & Manchester Railway formed part of a direct route from Manchester to the West Riding, enabling the LNWR to access the textile and coal industries of West Yorkshire. By 1851, the LNWR was the most prominent railway company of the period, with over 800 miles of track and was the largest joint-stock concern of its time, capitalised at £29 million. The line was acquired by the London Midland and Scottish Railway in 1923, before being nationalised in 1948.

5.1.5 Whilst other parts of the Transpennine route were subject to significant alterations, the Huddersfield & Manchester Railway between Standedge Tunnel and Stalybridge was subject to relatively limited alteration. The Micklehurst Loop was constructed from 1881-85 to provide additional capacity, and diverged from the existing railway to the east of the Tame Vally, avoiding physical interaction with the majority of its alignment. A new junction to the south of Greenfield Station is shown on historic maps from the early 20th century as additional tracks toward Oldham were established from this station. However similarly to the Micklehurst loop, the additional lines diverged from the main Huddersfield line, running westwards at its intersection with Shaw Hall Bank Road Footway (MVL3/26). The railway was also widened to the east of Diggle to accommodate additional tracks serving new bores for the Standedge Tunnel which were added in 1868-71 and 1894, necessitating widening of bridges to the east of the route.

5.1.6 Piecemeal change has occurred on the Huddersfield & Manchester Railway, most notably with the closure of a small number of stations along the route, such as Diggle and Saddleworth Stations. The route today forms part of the wider Transpennine route between York, Selby and Manchester, which comprises sections of rail line developed by different railway companies.

5.1.7 The history and significance of the Transpennine route is discussed at more length in the Route-Wide Statement of Significance (Alan Baxter Associates 2019). This was produced to characterise the overall heritage significance of the Transpennine route as a whole.

5.2 Heyrod Hall Overbridge (MVL3/7)

History

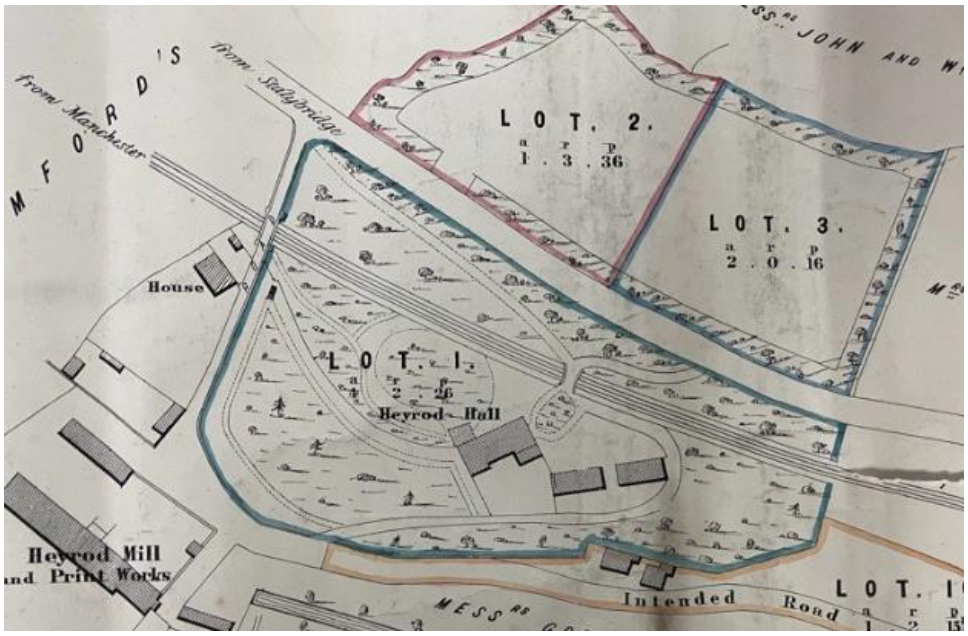
5.2.1 Heyrod Hall Overbridge (MVL3/7) was constructed between 1845 and 1849 during the Heroic Age of railway building. The single-span bridge was designed by A.S. Jee for the Huddersfield & Manchester Railway and is situated to the east of the village of Heyrod.

5.2.2 The overbridge was constructed to allow continued access from Wakefield Road to Heyrod Hall (non-designated heritage asset see paragraph 5.3.4). The 1st edition 6-inch Ordnance survey map of 1848 reveals the railway and adjacent road to have been cut through the small parkland associated with Heyrod Hall, dividing it into three uneven parts. The Hall and associated outbuildings are shown to have been located to the east of the railway cutting. A driveway is shown to have extended from Wakefield Road across Heyrod Hall Overbridge (MVL3/7) to give access to the house. This was the only direct access for the Hall over the railway line and indicates that Heyrod Hall Overbridge was purpose-built to provide access to the Hall. The parkland is shown to have had a boundary band of trees, as well as pleasure grounds and a productive garden focussed around the house. Despite its severance from the core of the park around the Hall, the area to the west of Wakefield Road appears to have remained a parkland, defined by a boundary belt of trees. An auction plan dating from 1856 (see Insert 5-1 below) indicates this land remained as parkland, and was advertised for sale in the same plot as the hall. To the east of Heyrod Hall, industrialisation along the River Tame is apparent with the presence of Hartshead Printworks and associated reservoirs.

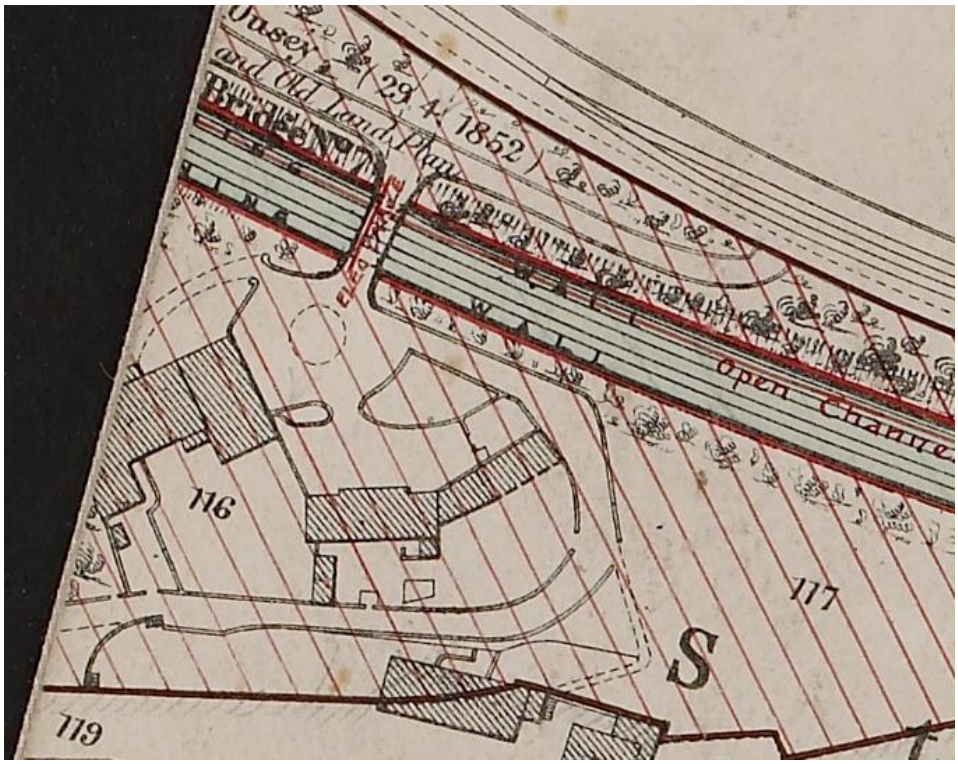
5.2.3 By the time of the 1937 6-inch Ordnance map, Heyrod Hall Overbridge (MVL3/7) continues to provide access to Heyrod Hall, however change is apparent in the wider landscape. The former parkland to the west of Wakefield Road is shown to have been developed with semi-detached housing, whilst to the north-east of

Heyrod Hall, Hartshead Power Station was established, the cooling towers for which were supplied by water from the reservoirs formerly associated with the Hartshead Printworks.

5.2.4 Heyrod Hall Overbridge (MVL3/7) remains in use today, carrying the access route to Heyrod Hall. Historic plans show that the access to the bridge was reconfigured in the mid-20th century, presumably enabling the construction of the housing along Wakefield Road. No other alterations to the bridge or access road are discernible from historic mapping.



Insert 5-1 Heyrod Hall Overbridge (MVL3/7) shown on an auction sale plan dated 1856, held by Tameside Archives



Insert 5-2 Heyrod Hall Overbridge (MVL3/7) from the historic line plans held by Network Rail

Description

5.2.5 Heyrod Hall Overbridge (MVL3/7) comprises a single segmental-arched bridge with battered abutments (Insert 5-3). The railway crossing is aligned southeast to northwest, sloping downwards towards the east due to the gradient of the local topography, and spans the two-track railway line which is set within a steep cutting. The bridge survives in its original form, with no evidence of alteration.

5.2.6 The bridge is constructed in rock-faced coursed sandstone with ashlar dressings. The bridge spans the railway by means of a segmental arch rising from an ashlar impost band. It is articulated by rusticated voussoirs with tooled faces and a projecting keystone. Above the segmental arch is a projecting carriageway band (a band which looks like a stringcourse) with low parapet over, topped with flat ashlar coping stones with pyramidal stops. The wing walls are splayed with battered abutments. The bridge deck has a gravelled surface.

5.2.7 The setting of Heyrod Hall Overbridge (MVL3/7) has changed since it was first developed. Historically, the overbridge provided access to Heyrod Hall, structures ancillary to the hall and landscaped gardens to the east, with the parkland to west. In the mid-20th century, the parkland to the west was superseded with a residential cul-de-sac,

which removed the historic integrity of its setting with Heyrod Hall. These residential houses are not considered to contribute towards the setting of Heyrod Hall Overbridge (MVL3/7). Heyrod Hall is visible from the bridge deck, however dense vegetation and distance obstructs visibility. Furthermore, the principal elevation of the hall is set at an oblique angle to the bridge, with Heyrod Hall Overbridge (MVL3/7) not comprising a prominent feature in the grounds of the hall. Nevertheless, the bridge is primarily experienced as an access route to the hall, with the historic linkage between these structures (Insert 5-4) contributing to the setting of the bridge. Views south-west and north-east from the bridge deck looking out onto the railway can be appreciated, and Heyrod Road Footbridge (MVL3/6) to the south provides a good vantage point from which to appreciate the south-west elevation of the overbridge.

Insert 5-3 Heyrod Hall Overbridge (MVL3/7) north-east elevation.

Insert 5-4 Heyrod Hall Overbridge (MVL3/7), view south-east across the bridge towards Heyrod Hall.

Insert 5-5 Heyrod Hall Overbridge (MVL3/7), view across the bridge parapet looking north-east

Insert 5-6 Heyrod Hall Overbridge (MVL3/7), view across the bridge parapet looking south-west

Significance

5.2.8 Heyrod Hall Overbridge (MVL3/7) was designated as a grade II listed building in 2017. The Historic England list entry description identifies the bridge to be of special interest for the following reasons:

- Historic interest:
    - Constructed during the Heroic Age of railway building and a little-altered example of an 1840s overbridge on what is now one of the main railway lines in northern England.

    - Designed by the notable railway engineer Alfred Stanistreet Jee.
- Architectural interest:
    - The bridge is well-detailed with ashlar impost bands and string course, and piers and voussoirs with tooled margins, that lift its design above the purely functional.
- Group value:
    - With the other listed structures designed by Jee on the Huddersfield & Manchester Railway line.

5.2.9 Heyrod Hall Overbridge (MVL3/7) is of significance as a largely unaltered example of an 1840s overbridge, dating from the Heroic Age (1841–50) of railway building and the period of 'railway mania' which marked a time of commercial confidence and expansion in the railways. The bridge's direct relationship with historic railway companies of the period, comprising the Huddersfield & Manchester Railway and LNWR, and the notable railway engineer A. S. Jee, who also designed similar structures along the route, give the structure historical value from which it derives significance. The bridge remains in use as a part of the operational railway network and together with surviving contemporary structures, evidences the historic infrastructure of the Huddersfield & Manchester Railway.

5.2.10 Heyrod Hall Overbridge (MVL3/7) derives significance from the quality of its architecture and construction, a characteristic feature of Jee's work for the Huddersfield & Manchester Railway. Architectural elements such as the rusticated voussoirs and carriageway band, together with the quality of workmanship across the structure are notable features of Jee's design which elevates the structure above the purely functional. The design language used is consistent with other overbridges built along this section of the Huddersfield & Manchester Railway, contributing to the understanding of the group value of these related structures. The bridge survives in its original form, with no evidence of significant intervention or alteration, and remains in use for its original purpose, providing access to Heyrod Hall. The integrity of the structure enables understanding of Jee's original design intent and this is a strong contributing factor to its significance.

5.2.11 The setting of Heyrod Hall Overbridge (MVL3/7) makes some contribution to the significance of the structure. Its relationship with the railway is a key component of its setting given that the bridge continues to span the railway cutting, retaining a close physical and functional relationship with the railway. Views from the bridge north-east and south-west along the railway alignment evidence this relationship. Generally, there is very limited visibility of the bridge

elevations, due to its position within the cutting. However, views towards the south-west elevation are possible from the vantage point provided by Heyrod Road Footbridge (MVL3/6). Though the wider historic setting has been developed in the mid-20th century, the association of the bridge and Heyrod Hall remains intact and appreciable. To this effect, the setting of Heyrod Hall Overbridge (MVL3/7) makes a minor contribution to its overall significance.

Group value

5.2.12 As identified in the list description, Heyrod Hall Overbridge (MVL3/7) is recognised to be of group value with other listed structures by A.S. Jee on the Huddersfield & Manchester Railway[1]. These comprise:

- Springbank Lane Footbridge (MVL3/8) (grade II listed, NHLE 1452382);
- Springbank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (grade II listed, NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405);
- Wrights Mill Overbridge (MVL3/20) (grade II listed, NHLE 1452406);
- Wright's Overbridge (MVL3/23) (grade II listed, NHLE 1452409);
- Royal George Underbridge (MVL3/25) (grade II listed, NHLE 1451848);
- Shaw Hall Bank Road Footway (MVL3/26) (grade II listed, NHLE 1451852);
- Oldham Road Roadbridge (MVL3/28) (grade II listed, NHLE 1451853);
- Wickens Underbridge (MVL3/29) (grade II listed, NHLE 1451854);
- Uppermill Viaduct (MVL3/31) (grade II listed, NHLE 1068120);

[1] Wheatley's Overbridge (MVL3/103) (grade II listed NHLE 1450537**)** was designed by A.S. Jee for the Huddersfield & Manchester Railway. Consent was granted for extensive change to the overbridge as part of the Huddersfield to Westtown (Dewsbury) Order section of the Transpennine Route Upgrade. The overbridge will be demolished and replaced with a new structure (ref 2021/91337). This is likely to result in de-listing. As such its contribution to group value has therefore been excluded from this assessment.

- Slaithwaite Viaduct (MVL3/61) (grade II listed, NHLE 1224049);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);
- Milne Viaduct (MVL3/76) (Longwood Viaduct) (grade II listed, NHLE 1220121);
- Church Street (MVL3/82) (grade II listed, NHLE 1452083);
- Huddersfield Viaduct (MVL3/92) (grade II listed, NHLE 223531);
- Hillhouse Lane Underbridge (MVL3/94) (Willow Lane East) (grade II listed, NHLE 1432641); and
- B6118 Colne Bridge Road Overbridge (MVL3/107) (grade II, NHLE 1450265)[2].

5.2.13 Of these bridges, four are of particularly similar form to Heyrod Hall Overbridge (MVL3/7). These bridges comprise segmental arched bridges of stone construction, which are similarly detailed architecturally. These overbridges comprise:

- Springbank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405);
- Wrights Mill Overbridge (MVL3/20) (grade II listed, NHLE 1452409); and
- Wright's Overbridge (MVL3/23) (grade II listed, NHLE 1442409).

5.2.14 The group value which Heyrod Hall Overbridge (MVL3/7) derives from these relationships provides an understanding of the wider trends and engineering achievement which characterise both the Huddersfield & Manchester Railway and the Heroic Age of railway building (1841-50) more generally. This group value is enhanced by the structures continuing to form part of the operational railway; as a collective group of assets, they are experienced by those following the rail line (traveling on it, or near it) as coherent features of a single historic route.

[2] B6118 Colne Bridge Road Overbridge (MVL3/107)) (grade II, NHLE 1450265) will be partially demolished and rebuilt with a supplementary structure replacing its spans over the railway. Listed building consent has been granted for this considerable intervention (ref: 2021/91330), and as a result may limit the contribution that this bridge makes towards the group value with the Jee bridges.

5.2.15 Masonry railway bridges across the historic Huddersfield & Manchester Railway route have been characterised as being of local or regional interest, depending on their architectural quality, contribution to wider historical interest of the route, and their group value. It has been noted however that, as a group, they are not of substantial national interest due to their dating from a period of railway development when thousands of similar structures were erected (Alan Baxter Associates, 2019).

5.3 Surrounding heritage assets

5.3.1 The location of the designated and non-designated heritage assets discussed below are shown in Appendix A.

Designated heritage assets

5.3.2 There are no designated heritage assts located within 250 m of Heyrod Hall Overbridge (MVL3/7)

Non-designated heritage assets

5.3.3 The Greater Manchester Historic Environment Record lists four non-designated heritage assets within 250m of Heyrod Hall Overbridge (MVL3/7)[3]. These comprise:

- The former site of Rushfield (9174.1.0);
- The former site of Hartshead Print Works (5802.1.0);
- The former site of Heyrod Old Hall (751.1.0); and
- Heyrod Hall (751.2.0).

5.3.4 Of these assets, Heyrod Hall Overbridge (MVL3/7) has a direct historic relationship with Heyrod Hall (751.2.0), having been constructed to provide access to the Hall over the railway cutting. Heyrod Hall (751.2.0) was rebuilt in the 19th century on the site of a historic hall (751.1.0). The record of a datestone reading 1638 mean the old hall is believed to have been built or rebuilt in the early 17th century (Butterworth, 1827, p. 129). The hall was demolished and rebuilt at the time of the construction of the railway (Walker & Tindall, 1985, p.166). The hall and estate changed ownership at this time, and notably when the railway opened in 1849 J.H Nowell of the firm Nowell and Hattersley lived at the hall. Nowell and Hattersley were contractors for the works on the railway (Leeds Intelligencer, 1849).

5.3.5 The access to the hall facilitated by the bridge still remains and contributes to the significance of both assets. The overbridge does

[3] Heyrod Hall Overbridge (MVL3/7) is recorded by the Greater Manchester Historic Environment Record as 17177.1.0.

not form a prominent architectural feature in views to or from the hall, being set at an oblique angle to the side elevation, and sunk within the railway cutting, reducing its visual prominence.

5.3.6 The former sites of Rushfield (9174.1.0) and Hartshead Print Works (5802.1.0) are now demolished which, although of historic interest, do not have any tangible relationship with Heyrod Hall Overbridge (MVL3/7) today.

5.3.7 In addition to these assets recorded on the Greater Manchester Historic Environment Record, Heyrod Road Footbridge (MVL3/6) is identified as a non-designated heritage asset within 250m of the listed building. The footbridge consists of piers of squared and coursed quarry-faced stone, the span was replaced with a steel deck in 2004. Due to the extent of this alteration, the footbridge is of limited significance. There is a historic relationship between Heyrod Road Footbridge (MVL3/6) and Heyrod Hall Overbridge (MVL3/7), the structures are both believed to have been constructed during the same phase to facilitate the opening of the railway in 1849. Heyrod Road Footbridge (MVL3/6) also offers a vantage point from which the south-west elevation of Heyrod Hall Overbridge (MVL3/7) can be viewed.

6. PROPOSALS

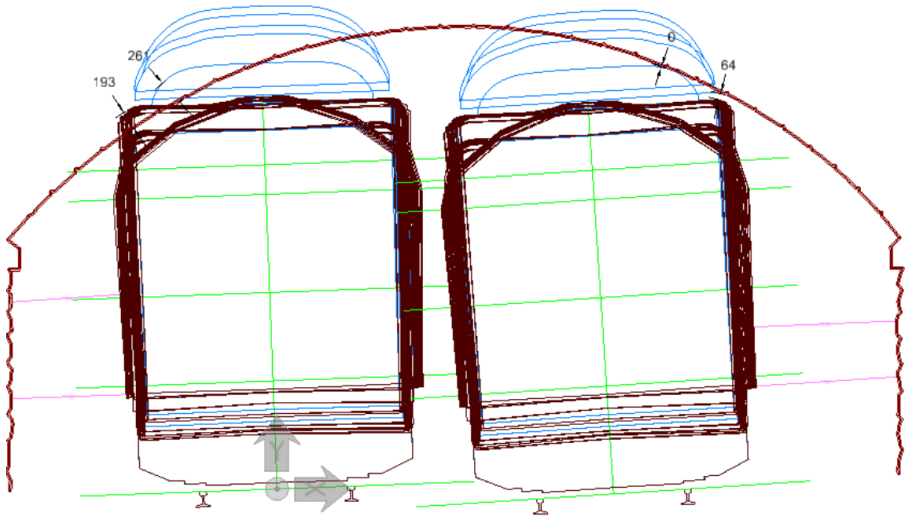
6.1 Background of proposals

6.1.1 In order to achieve the TRU Programme objectives of improving journey times, capacity, overall reliability and resilience, and delivering environmental benefits, the electrification of the railway line and achievement of increased line speed is required. This necessitates the installation of overhead lines along Route Section W2B.

6.1.2 Inadequate clearances to safely install OLE has been recognised as a challenge across much of the TRU, preventing the installation of overhead lines below some existing overbridges. To reduce the requirement for intervention into structures along the route as far as possible, a scheme-specific pantograph has been developed which enables the use of reduced overhead line wire height under structures, subject to a site-specific risk assessment. A number of structures along the route also do not provide adequate gauge clearance for the required freight trains on the route, the requirement for which has been considered as part of the design development process.

6.1.3 Insert 6-1 shows that even with use of the scheme-specific pantograph, there would still be significant clash between OLE and

Heyrod Hall Overbridge (MVL3/7). Similarly, the bridge does not have the required freight gauge clearance. A process of design optioneering to identify the optimal solution has been undertaken.



Insert 6-1 Drawing showing the clash between existing structure and proposed pantograph level

6.2 Design development and justification

6.2.1 Design development for Heyrod Hall Overbridge (MVL3/7) has taken into consideration a number of factors including the significance of the listed structure, operational requirements and constructability. The design development process has also involved engagement with Historic England and TMBC. This iterative and robust process ensured the rigorous exploration of available options, incorporating multi-disciplinary review and ongoing engagement with the heritage consultees.

6.2.2 Based on Network Rail's extensive experience delivering comparable schemes, five options were identified for consideration. As introduced in Section 6.1, the option of retaining the structure without undertaking any works would prevent the delivery of the Order Scheme. This option was therefore discounted at an early stage. The remaining four options comprised:

1. Track Lower - Lowering the height of the track to achieve the required headroom while retaining existing bridge.

2. Bridge Jacking - Increasing the height of the bridge through structurally lifting the arch barrel up from the abutments. This would require diagonal cuts to be made to separate the arch barrel from the abutments, lifting of the arch, infilling of the resulting gaps and refacing.

3. Bridge Reconstruction – Removal of the bridge arch and replacement with a deck providing sufficient clearance.

4. Bridge Removal – demolition of the existing bridge, making good the embankments and improvement of access from Printworks Road to provide access to Heyrod Hall.

6.2.3 A summary of the optioneering undertaken for these options is summarised in Table 6-1.

Table 6-1 Optioneering for Heyrod Overbridge (MVL3/7)

Option	Key Considerations	Advantages	Disadvantages	Preferred
1) Track Lower	• Sufficient clearance needs to be achieved to enable electrification of the line and allow freight gauge clearance. • Time required working within the railway corridor is required to be minimised as far as possible to reduce risk to construction staff and the length of line possession (closure of the railway) and resulting disruption to railway service. • The bridge spans a railway cutting and is accessible from the highway network only via a narrow lane between two terraces of houses. This restricts the accessibility of construction vehicles and the delivery of materials / components getting to the site. • Ground investigation has revealed rock to be present at shallow depth within the railway cutting. There is currently no functional track drainage at this location. • The foundation depths of the bridge and cutting retaining walls are a consideration in the development of proposals for Heyrod Hall Overbridge (MVL3/7). Lowering of ground level within the cutting has the potential to undermine these foundations or necessitate significant engineering works to ensure their stability. • The designation of the bridge as a grade II listed structure places a requirement on Network Rail to have special regard for its preservation under the Planning (Listed Buildings & Conservation Areas) Act 1990.	• Lowering of the track would enable retention of the bridge with raising of the parapets undertaken prevent access to OLE.	• To achieve the required clearance, the track would have to be lowered by 500 mm for a distance of 260 m. Due to the shallow depth of rock at this location, this is a substantial engineering operation. • Underpinning of the bridge and stabilisation of the retaining wall may be required due to the shallow depth of their foundations. Underpinning may present risks to the listed building due to changes to the structural performance of the historic structure. • These interventions would require lengthy line possessions to remove the rock, underpin the bridge and stabilise the retaining walls. This would result in significant disruption to the railway and incur considerable public expenditure.	N
2) Bridge Jacking		• This option would enable the retention of the listed bridge. The abutments, deck and parapet would be retained, although in altered form.	• Bridge jacking for masonry arch bridges is a relatively untested methodology, having been delivered on very few historic structures to date. The feasibility jacking masonry arch structures relies on optimal site conditions, where a high level of control can be achieved and long timescales allowed for implementation. The long-term viability of this option is currently unknown. • Bridge jacking would incur extensive disruption to railway users, requiring all works be delivered on site and little scope for off-site construction. • The location of the bridge over a cutting with limited access has significant limitations for execution of a bridge jacking operation. • Jacking of the bridge would raise the level of the access road across the bridge and require a greater increase to parapet height across the structure along with re-grading of access road approaches. • Raising of the bridge arch would impact the form and appearance of the structure, interrupting architectural features such as the stringcourse and the stone coursing pattern across the parapets, detracting from its architectural value and integrity.	N
3) Bridge Reconstruction		• Reconstruction of the bridge would enable the preservation of some elements of the historic structure, through the retention and reuse of the bridge abutments in conjunction with the new bridge deck. • Historic masonry can be reclaimed from removal of the bridge arch and parapets and reused on the reconstructed structure, aiding integration of historic and modern fabric and reduce the visual impact of the reconstruction works. • Reconstruction of the bridge can be delivered substantially from track level. This would minimise the need for construction access by road at this constrained site. • The installation of a preconstructed deck would minimise railway possession time and disruption to the railway network.	• Reconstruction of the bridge would result in the loss of the bridge arch and a portion of the parapets and abutments. This would result in the removal of a significant proportion of the historic bridge, substantially altering its form and appearance, and negatively impacting the integrity and significance of the structure.	**Y**
4) Bridge Removal		• Removal of the bridge would minimise disruption to the railway network and provide a cost effective solution.	• This option would result in the complete removal of the bridge and the loss of a grade II listed structure. • Removal of the bridge would permanently remove road access to Heyrod Hall from Wakefield Road (A63), and necessitate the provision of new road access from Printworks Road.	N

6.2.4 Option 1 Track Lower, and Option 2 Bridge Jacking would both have enabled retention of the maximum amount of historic fabric. However, these options were discounted due to the difficulty of delivering these at this constrained site, the as-yet unproven long-term viability of bridge jacking, and due to the significant cost and disruption required. Option 4, Bridge Removal, was discounted due both to its negative impact on the listed structure and to local residents. Option 3, Bridge Reconstruction was therefore identified as the preferred option to achieve the required clearance for Heyrod Hall Overbridge (MVL3/7). Whilst this option would result in significant alteration of the listed bridge, it was found to represent the most deliverable solution. This took into account the constrained nature of the site; the aims of the Order Scheme; minimising disruption to the railway network and enabling retention of historic fabric as far as possible.

6.3 Preferred option design development – Bridge Reconstruction

6.3.1 Design development was subsequently undertaken to mitigate as far as possible the potential impact of reconstruction on the heritage significance of Heyrod Hall Overbridge (MVL3/7)

6.3.2 The sympathetic approach taken to bridge reconstruction during the restoration of the Huddersfield Narrow Canal prior to its reopening in 2001 was considered as a ‘Reference Design’. The reconstructed masonry canal bridges are in proximity to the W2B section of the Transpennine route and successfully integrated reconstructed bridges within the historic character of the canal corridor. It was recognised by heritage stakeholders that the reconstruction of these canal bridges had successfully achieved designs which responded to the significance of the historic bridges.

Form of Replacement Deck

6.3.3 A number of constraints which had the potential to influence the feasible options for the replacement deck design were identified. These have shaped the choice of the form of the proposed replacement deck. These constraints can be summarised as follows:

- Geometric constraints
    - Gauge clearance – the minimum distance of clearance required between the soffit of the deck and the proposed OLE.
    - Alignment of the access road – the requirement to preserve the existing alignment of the access road which passes between nearby dwellings before a junction with Wakefield Road (A635).

  - Narrow deck width – the width of the deck is dictated by the bridge abutments and alignment of the highway.

- Construction constraints
  - Lift limit <30 t – due to the layout of the site, there is limited access for a large capacity crane at road level, therefore all bridge components have to be delivered from the track and installed with use of a railway crane, with a maximum lift weight capacity of 30 t.
  - Minimisation of disruption to local residents and particularly residents of Heyrod Hall and neighbouring properties.
  - Minimisation of disruption to railway users caused by railway line closures. Shift hours are limited by the window within which work can be safely completed while minimising impact on railway users.

6.3.4 Three forms of bridge deck were considered as potential options for the reconstruction of Heyrod Hall Overbridge (MVL3/7):

- Network Rail standard Conarch.
- Portal deck.
- Filler beam construction.

Table 6-2 Summary of bridge deck design options

Option	Assessment	Preferred	Indicative Photo
1 – Standard Conarch	A standard Conarch is a portal bridge consisting of standardised precast concrete frames which conform with Network Rail's specification. Where the necessary specification requirements are met, these precast units can be transported to site and installed quickly and efficiently to form a portal overbridge, with deck cast in-situ to form a continuous structure. The use of a standardised Network Rail Conarch bridge (precast concrete arch) is not considered feasible at this site and was discounted at an early stage, primarily due to its geometric constraints. The required narrow deck and retention of the alignment of the highway would not allow Network Rail technical standards to be met. The lifting capacity limitations due to the use of a railway crane also discounted the use of standard Conarch edge beams due to their weight.	N	
2 - Portal	A portal bridge consists of a series of precast concrete frames which are then transported to site and installed, with deck cast *in-situ* to form a continuous structure. Unlike a standard Conarch, portal bridges can be designed to bespoke dimensions, allowing site specific geometry to be accommodated. Lift weight limitations and the requirement for a separate parapet beam for this option would impact the level and width of the access road. The portal would result in a larger area of visible concrete, reducing the degree to which they could be sensitively integrated with the retained masonry elements of the listed structure. Portal structures would also require bespoke beam design at each site, reducing standardisation between the proposed new bridge decks on Route Section W2B, increasing costs of the publicly funded works.	N	
3 – Filler Beam	A filler beam deck consists of a concrete slab with longitudinal reinforcing steel beams. This form of construction accommodates site geography, minimises the required lift weights, maximises the extent of works that can be undertaken off-site, and standardises the beam design between sites. The integral edge beam also avoids constraining the layout of the highway. The potential standardisation offered by sympathetically integrated filler beam decks along Route Section W2B would maintain a degree of consistency of design between the structures. This consistent design response to the challenge of electrifying the route could be viewed as part of the next chapter for the management of this section of the Transpennine route.	**Y**	

6.3.5 The filler beam deck (option 3) was selected as the preferred design option and further consideration was given to ensuring the proposed works would be sympathetic to the existing aesthetic of the structure.

6.3.6 In order to visually integrate the proposed precast concrete riser units with the retained masonry abutments, it is proposed to clad their external face with natural stone. The underside of the new deck would not be clad, the benefit of cladding this element would be extremely limited given the lack of visibility of the underside of the deck. Cladding would also present a number of safety risks namely, the introduction elements that may fall onto the railway corridor should they fail over time, the obscuring of critical structural elements that require routine inspection, and the introduction of an additional construction activity that would be undertaken at height and within the railway corridor. It is proposed that the new filler beam deck includes a feature line which would tie in with the stringcourse of the existing structure. The use of masonry cladding and the detailing of a feature line comprise integrated design elements responding to specific features of the existing structure that contribute to its character and architectural interest.

Parapet design

6.3.7 The new parapet design had to achieve vehicle containment and protection of bridge users from the electrified line, whilst responding to the significance of the existing bridge. Numerous options for the proposed new parapet design were considered, these options are summarised below in Table 6-3

Further optioneering was then undertaken to identify a suitable material for the bridge copers, as set out in Table 6-4.

Table 6-3 Summary of parapet design options

Option	Core	Road Facing Elevation	Track Facing Elevation	Assessment	Preferred	Indicative photo
1	Concrete	Concrete with liner finish	Concrete with liner finish	• Pre-cast concrete parapet with exposed concrete liner on both sides of parapet. • This option would not be considered to result in a sensitive addition, with extensive amounts of concrete visible in views of and across the bridge.	N	
2	Concrete	Natural stone cladding	Concrete with liner finish	• Pre-cast concrete parapet with exposed concrete liner on track facing elevation and stone cladding installed to highway facing elevation. • This option would not be considered to result in a sensitive addition, with extensive amounts of concrete visible in views of the bridge.	N	
3	Concrete	Reclaimed stone cladding (as far as possible), newly quarried natural stone cladding where required	Natural Stone cladding	• Pre-cast concrete parapet with natural stone pre-cast into track facing parapet off-site and natural stone cladding installed on highway side post installation. Stone reclaimed from the existing bridge would be used to clad highway-facing elevation as far as reasonably practicable. • This option is considered to represent the optimum balance between constructability, safety and a design sensitive to the significance of the structure.	**Y**	
4	Steel framework	Natural stone	Natural stone	• This option comprises natural stone blocks built up in courses with joints reinforced by a stainless steel framework which is cast into the concrete edge beam. • Due to the time limitations and safety implications of working in an active railway corridor coupled with the minor difference in appearance between Option 3 and Option 4, this option has not been progressed.	N	
5	Masonry	Rebuilt from original stone	Rebuilt from original stone	• The new parapets are required to comply with the relevant standard for vehicle containment. Unreinforced masonry parapets using reclaimed stone would not achieve these standards and result in a safety risk that would be avoided with design option 3. Due to the time limitations and safety implications of working above an active railway corridor with limited edge protection during the rebuilding of parapets, coupled with the minor difference in appearance between Option 3 and Option 5 when viewed from the carriageway, this option has not been progressed. The quantity and quality of the stone able to be reclaimed from the site is also considered a limiting factor.	N	

Table 6-4 Coping stone optioneering

Option	Advantages	Disadvantages	Indicative image	Preferred
Option 1 – Natural Stone	• Natural stone would be sympathetic to the historic character of Heyrod Hall Overbridge (MVL3/7), in keeping with its architectural interest. • Natural stone copers would represent an honest intervention, with the form of the stones readable as a response to the electrification challenge, while sympathetically integrating with the existing and historic character of the bridge. • Over time, this material would weather to further integrate with the existing and proposed masonry elements.	• Natural stone is the heaviest of the three options with a loading of 25kN/m3, requiring consideration in the design of the structural elements of the parapet units and connection with deck. • The weight of natural stone also requires special consideration be given to manual handling safety protocols. • This option is determined to be the most expensive of the three options due to costs for quarrying and fees for masonry contractors.		**Y**
Option 2 – Coloured Concrete	• Lighter material than natural stone with a density of 18 kN/m3. • Concrete can be coloured to achieve a close visual match to the adjacent masonry coping stones • This material would weather over time, increasing the similarity in appearance between coloured concrete and the existing masonry • Coloured concrete copers would be relatively cost effective, reducing the cost of this publicly funded project	• Introduction of modern material, would represent a departure from the materials historically used for coping stones. • While relatively sympathetic this material would risk negatively impacting on the architectural interest of the Heyrod Hall Overbridge (MVL3/7).		N
Option 3 – Glass Reinforced Plastic (GRP)	• Lighter material than natural stone. • Cost effective material, reducing the cost of this publicly funded project.	• There would be a stark visual disparity between the GRP copers and historic fabric, detracting from the architectural interest of Heyrod Hall Overbridge (MVL3/7). • GRP copers would not weather or soften in the way natural stone or concrete would, with the difference in material continuing to detract from the character of the historic bridge. • Of the options considered, GRP copers would result in the highest level of harm to the character of the bridge		N

6.3.8 The preferred Option 3 pre-cast concrete parapet with natural stone cladding for parapet design presented in Table 6-3 would ensure the proposed parapets visually integrate with the retained elements of the existing bridge, while enabling a degree of off-site construction. This approach would realise safe working for operatives constructing the Order Scheme at this location by avoiding working at height over the railway line. It would also successfully reduce the time required for line possession compared to other options, thereby minimising disruption to railway users. This option also presents the opportunity to use reclaimed stone on the highway-facing elevations where possible, which would to a degree mitigate adverse impacts arising from the work.

6.3.9 As summarised in Table 6-4, the specification of natural stone copers would contribute to the high-quality finish of the reconstructed bridge, forming one of the factors embedded into the design which partially mitigates against the high level of harm arising from reconstruction. The use of natural stone copers (Option 1) and cladding would provide visual consistency for the reconstructed span and help to integrate the retained masonry structure with the proposed new span.

6.3.10 The minimum parapet height required by Network Rail Standard NR/L2/CIV/020 for alteration of bridges over an electrified lines is generally 1.5 m; however, justification must be given that a height of 1.8 m cannot be achieved whilst taking into account the risk profile of the bridge. This Network Rail Standard has its basis in ensuring safety on the railway delivers adequate protection for users and the public in line with Health and Safety legislation and Building Regulations.

6.3.11 The risk assessment undertaken for Heyrod Hall Overbridge (MVL3/7) identified the footbridge to be of ‘low risk’ with respect to security and contact with the public. Based on this assessment and in recognition of the need to retain the significance of the listed structure as far as possible, it has been determined that the minimum parapet height required for the structure is 1.5 m. This lower parapet height reduces the disparity between the new parapet and the retained pilasters, enabling more visual cohesion between the new and retained elements.

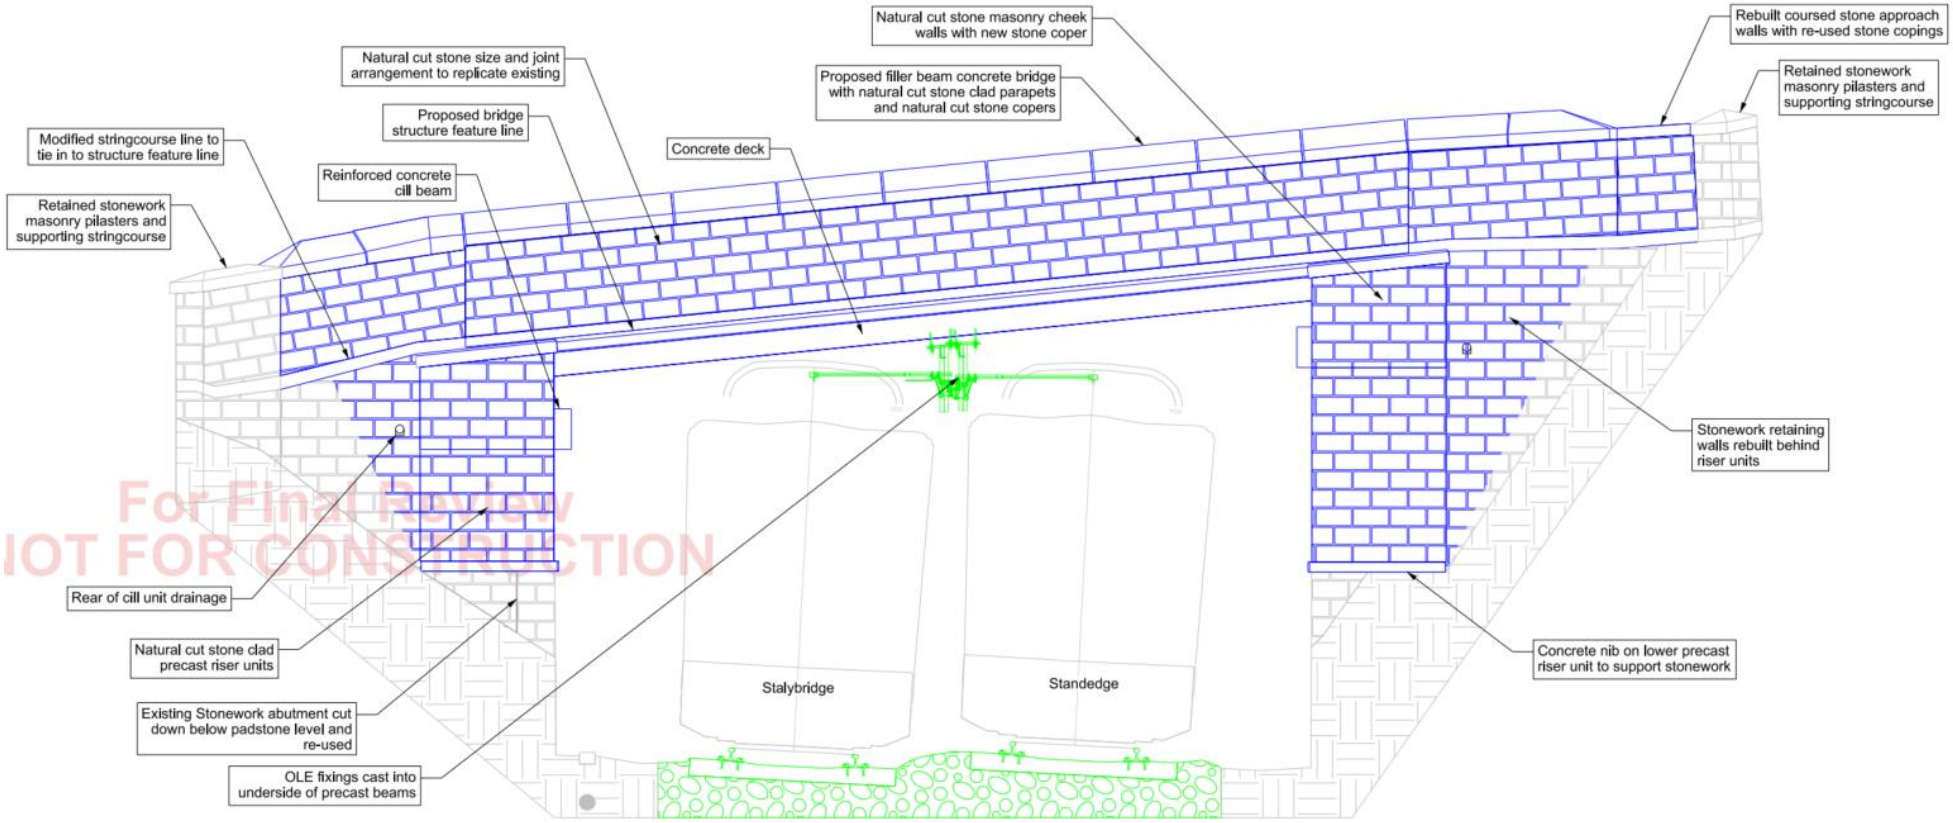
6.3.12 During removal of the existing arch, retention of historic fabric would be maximised as far as possible. Masonry reclaimed from the removal of bridges along the Route Section W2B would be assessed for its suitability for reuse as cladding.

6.4 Description of proposals

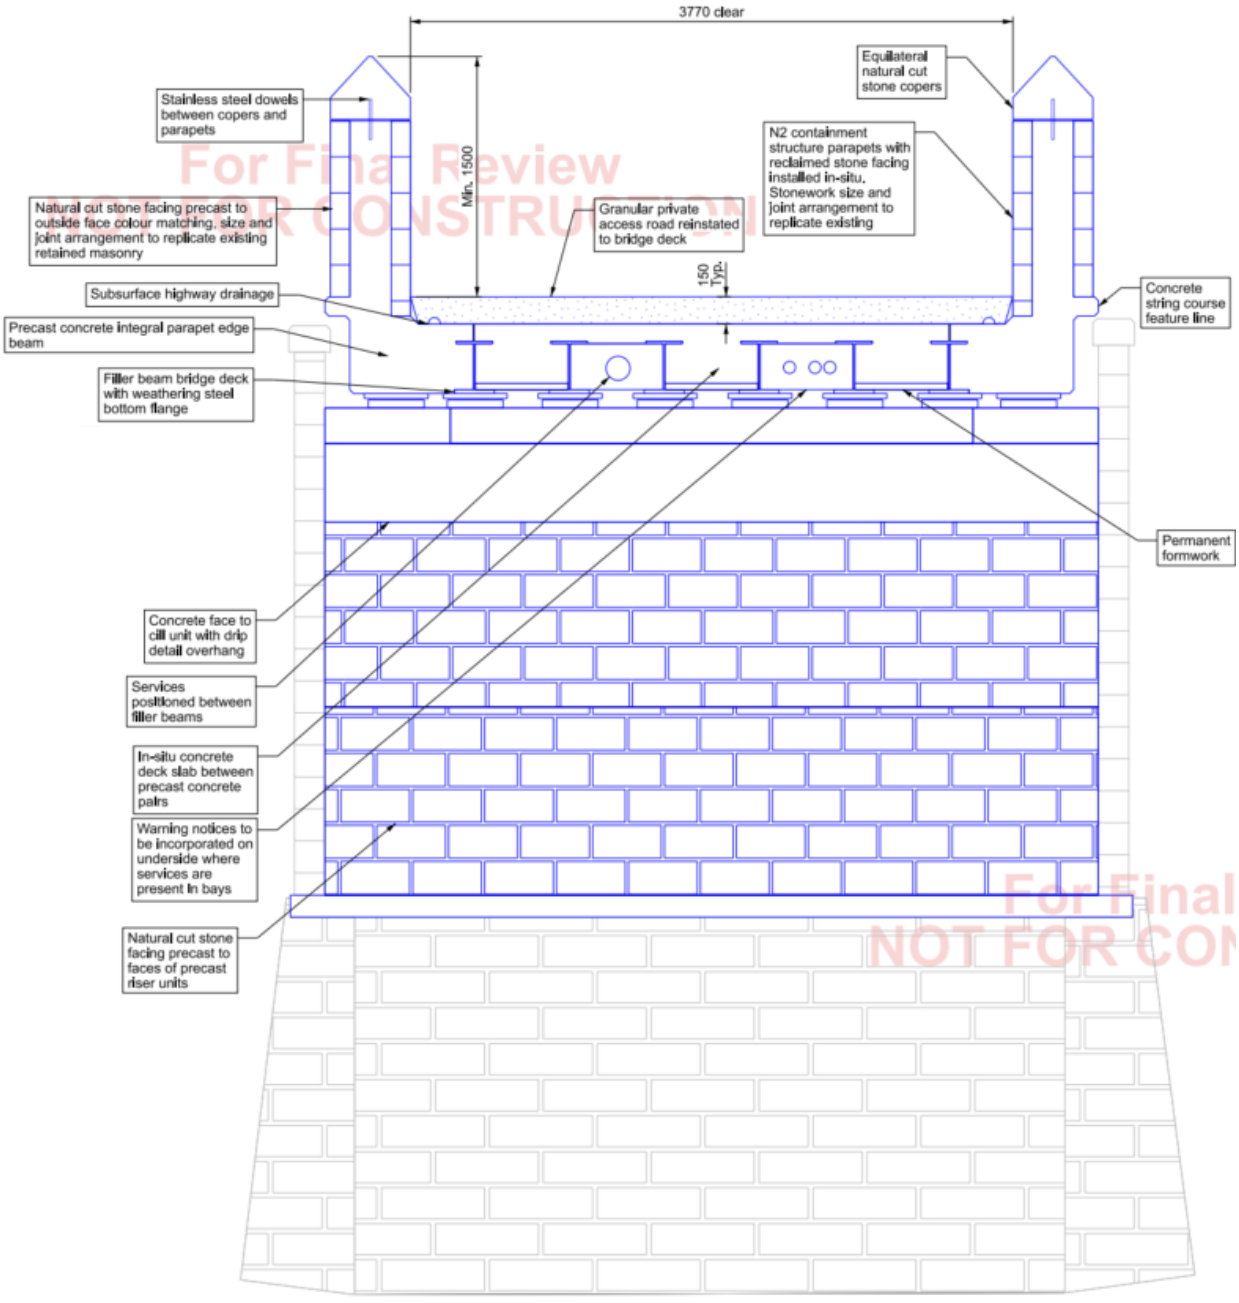
6.4.1 It is proposed to remove the deck of the grade II listed Heyrod Hall Overbridge (MVL3/7) and to construct a new filler beam span, with both the new parapets and structural elements designed in a style to respond to the architectural significance of the existing historic structure (Insert 6-2).

6.4.2 Removal of the existing masonry deck, arch and parapet would be undertaken, minimising the extent of demolition as far as possible and retaining fabric for reuse as far as possible.

6.4.3 The reconstructed bridge would consist of retained masonry abutments beneath the level of the existing impost bands, above which natural stone clad precast concrete risers would be installed. A concrete filler beam deck would be installed on bearings supported by a concrete cill beam. The deck slab would be cast in-situ using permanent formwork situated between weathering steel bottom flanges of the new steel beams. The precast concrete edge beams of the replacement deck would have integral parapets clad with natural stone with natural stone copers. The external parapet elevation would be clad off site and natural stone masonry cast into the exterior of the parapet. The internal elevation would be clad with masonry in-situ using stone reclaimed from the existing historic bridge as far as reasonably practicable. Two electrification hazard signs would be attached to the inside face of each parapet, along with a bridge strike sign. The edge beam design also includes a horizontal feature line which would tie in with the modified and retained existing string course. The highway would be surfaced using a granular material.



Insert 6-2 Proposed elevation of Heyrod Hall Overbridge (MVL3/7)



Insert 6-3 Proposed section Heyrod Hall Overbridge (MVL3/7)

Construction Methodology

6.4.4 The proposed works relating to the reconstruction of the overbridge would comprise:

- Locally break down approach walls and excavate behind deck ends in advance of demolition.
- Careful demolition of the existing masonry arch span by removing the masonry arch and cutting down the abutment to underside of springing stone level.
- Reclamation of historic masonry as far as possible with transportation and secure storage at the site construction compound. Stone would be subject to preliminary rapid assessment for potential reuse and then palletised ready for transportation back to site where it would be redressed and used as appropriate.
- Installation of new bridge elements including precast riser units, cill units, bearings, with materials transported to site by rail.
- Install prefabricated beam pair sections for filler beam deck, including edge beams with integral parapets.
- Cast in-situ concrete between beam pairs and topping slab for the bridge deck.
- The stone wingwalls and approach walls would be rebuilt where taken down locally to enable removal of the deck,
- Install deck waterproofing and protective finishes.
- Build in situ stone-facing to interior of the parapets using reclaimed stone as far as possible and install coper units.
- The approach stone walls would be rebuilt, stone copers installed. and the new access road installed.

6.4.5 The proposed works to Heyrod Overbridge (MVL3/7) are shown in the following drawings which accompany this application:

- Existing and Proposed Plan (167037-TGP-22-MVL3-DRG-T-LP-160713);
- Existing and Proposed Elevation and Section (167037-TGP-22-MVL3-DRG-T-LP-160714);
- Existing and Proposed Section 2 (167037-TGP-22-MVL3-DRG-T-LP-160715); and
- Existing and Proposed Elevation and Section (167037-TGP-22-MVL3-DRG-T-LP-160716).

7. IMPACT OF PROPOSALS

7.1 Heyrod Hall Overbridge (MVL3/7)

7.1.1 The proposed works to the grade II listed Heyrod Hall Overbridge (MVL3/7) are required in order to accommodate electrification of the Transpennine route as part of the wider TRU programme. In order to construct the Order Scheme, the proposed works would require the removal of most of the grade II listed Heyrod Hall Overbridge (MVL3/7) and its reconstruction. This would result in the loss of the majority of the structure, with the extent of retained fabric confined to the abutments, portions of the wingwalls, and pilasters at each end of the bridge parapets.

7.1.2 The proposed works would largely erode the historic and architectural value of the structure through its substantial removal. The retention of the pilasters would maintain an isolated element of the structure's architectural interest. However, their context as part of a little altered structure would be lost.

7.1.3 The proposed intervention would mean the substantial removal of a historic bridge that is part of the infrastructure associated with the Heroic Age (1841-50) of railway construction. It is not only a loss in its own right, but also detrimental to the historic character and group value that this structure contributes to as part of the Transpennine railway line.

7.1.4 The proposed reconstruction of the structure would have an impact on the group value of the bridges designed by A.S. Jee on the Transpennine route. The loss of Heyrod Hall Overbridge (MVL3/7) would remove one element of this group of 18 bridges designed by A.S. Jee (see paragraph 5.2.12) and one of the five bridges which share a common design language (see paragraph 5.3.6). The other bridges designed by Jee derive part of their value from their group relationship. The significance of each of the other bridges would therefore be slightly diminished by the removal of one of their number. The impact of this demolition would amount to less than substantial harm to the retained structures arising from a weakening of the extent to which group value contributes to their significance.

7.1.5 These proposals would therefore result in substantial harm to the significance of Heyrod Hall Overbridge (MVL3/7). The development of the design has embedded details to mitigate against this harm wherever possible. Reclaimed masonry cladding and natural stone copers would visually integrate the new fabric of the proposed deck and parapets with the retained pilasters and approach walls. This consistency of material and finish would reduce the degree to which the proposed change is experienced when moving across the bridge

and would realise an opportunity for the sustainable reuse of historic fabric on the reconstructed bridge. Similarly, the inclusion of a stringcourse detail in the proposed concrete edge beam would visually integrate the new structural element with the altered masonry stringcourse. The level of harm arising from the works would remain as substantial, but the careful consideration given to the visual relationship between the proposed and existing elements of the structure would to a small degree offset the potential harm to Heyrod Hall Overbridge (MVL3/7).

7.2 Other heritage assets

7.2.1 The proposals would have no impact on any other nearby designated or non-designated heritage assets. Some limited change to the setting of non-designated Heyrod Hall (751.2.0) has been identified. Although a historic association exists between Heyrod Hall Overbridge (MVL3/7) and non-designated Heyrod Hall (751.2.0), the reconstruction of the bridge would ensure the pattern of movement from Wakefield Road across the railway to the hall and its associated structures would be retained limiting the impact of the works. The proposed cladding and coping of the new parapets with natural stone would reduce the degree to which the change to the setting of the non-designated heritage asset is experienced. While constituting a change in the setting of the hall, it is considered the proposed demolition and replacement of the bridge would not result in harm to the significance of Heyrod Hall (751.2.0). Similarly, the proposed works would constitute a change to the setting of Heyrod Road Footbridge (MVL3/6). The historic association between the two bridges would remain unchanged following the proposed works, and the limited significance of Heyrod Road Footbridge (MVL3/6) would not be harmed.

7.3 Mitigation

7.3.1 Design proposals were developed through an iterative process which has robustly sought to avoid or reduce the impact on the significance of Heyrod Hall Overbridge (MVL3/7). Additional information with respect to these elements of design development is included above in Section 6.2.

7.3.2 Regular consultation with historic environment stakeholders and the design team were held throughout the new bridge's design development process (see Table 4-1 Consultation for Heyrod Hall Overbridge (MVL3/7)Historic environment stakeholders, including Historic England and TMBC, have been involved in the development of the design mitigation described below.

7.3.3 The design development process has resulted in mitigation being embedded within the design of reconstruction of Heyrod Hall Overbridge (MVL3/7). The following design considerations have been taken into account in response to the magnitude of proposed alteration:

- The use of natural stone cladding to minimise the areas of visible concrete, reflecting the materiality of both the original bridge and many of the other retained structures along the Transpennine route. This approach would ensure natural stone remains the dominant material of the exterior faces of the bridge.
- Salvaged stone from the demolished span would also be considered for reuse on the highway facing elevations of the parapet where feasible.
- The proposed feature line in the precast edge beam would help integrate the newly inserted concrete beam with the portions of string course on the retained pilasters.
- A common approach taken to the design of both bridge reconstructions of Heyrod Hall Overbridge (MVL3/7), Wright's Overbridge (MVL3/20) and Oldham Road Overbridge (MVL3/28). It is considered that progressing comparable designs in tandem would enable a coherent approach and would provide a visible reference to the new phase of design upgrades taking place in the 21st century. This is another chapter in the story of the railway's development and improvement.

7.3.4 During construction of the works, toolbox talks to disseminate best practice for reducing potential impacts in relation to construction activity associated with Heyrod Hall Overbridge (MVL3/7) would also be delivered, for example to help avoid accidental damage.

Recommended compensation

7.3.5 In addition to these embedded measures, additional mitigation secured through the use of listed building consent conditions is recommended comprising:

- A scheme of historic building recording to Level 3 standards in accordance with Historic England guidance (Historic England 2016). This would provide a permanent record of Heyrod Hall Overbridge (MVL3/7) in its current form and be lodged with the Greater Manchester Historic Environment Record. This building recording would help to compensate for the harm to significance resulting from the reconstruction by providing the opportunity to document the structure which

would be largely lost as a result of the proposed works. The historic building recording would include:

  - Drawings.
  - Photography.
  - Written account.

- A scheme of permanent heritage interpretation would be developed and installed adjacent to Greenfield Station. This would provide the opportunity to engage members of the public with the heritage of the Huddersfield & Manchester Railway including the historic structures designed by A. S. Jee such as Heyrod Hall Overbridge (MVL3/7). Further engagement with stakeholders with respect to the content of the interpretation would be undertaken during the detailed design phase.

7.4 Public benefit

7.4.1 The reconstruction of Heyrod Hall Overbridge (MVL3/7) and resulting substantial harm is considered justified to ensure the realisation of the substantial public benefits of the Order Scheme, in accordance with paragraph 214 of the NPPF.

7.4.2 As part of the wider TRU Programme, the Order Scheme would directly and indirectly play a role in improving regional connectivity and enhancing of some of Britain's busiest rail network, in turn realising economic, social and environmental objectives of the programme. The Transpennine route is identified as a key transport corridor, providing connections between cities in the North of England. The improvements in connectivity delivered by the TRU programme will support aspirations for economic growth and "levelling up" opportunities across the North of England.

7.4.3 The key objectives of the TRU programme are to achieve the part electrification of the Transpennine Route, improve journey times and capacity between key destinations, improve overall reliability and resilience of the route, and provide environmental benefits from modal shift from road to rail freight reducing the number of heavy vehicles on the highway network and associated air pollution. The reconstruction of Heyrod Hall Overbridge (MVL3/7) would directly facilitate the achievement of these aims by creating sufficient clearance beneath the bridge to accommodate electrification and the use of larger gauge trains, delivering increases in line speed, capacity and resilience.

7.4.4 Electrification would deliver faster journey times and improved performance by allowing trains to accelerate faster, and brake more

efficiently. The Order Scheme will deliver faster line speeds (80 mph throughout), improving journey times along the Transpennine Route, aiming to provide an improved journey time from Leeds – Manchester Victoria of 42-44 minutes and York to Manchester Victoria of 65-67 minutes. Works to the track and structures along the Route, including reconstruction of Heyrod Hall Overbridge (MVL3/7), are required to accommodate this increase, and without these changes the Scheme would be unable to go ahead.

7.4.5 As a vital constituent part of the Order Scheme, the proposed reconstruction would also facilitate indirect benefits associated with the wider programme of works, including station upgrades, track renewal and signalling improvements.

7.4.6 The reliability and resilience of the route and services operating on it will be improved by replacement of existing infrastructure with electrification equipment, new track drainage and signalling. Modern signalling equipment will reduce the headway between trains, allowing them to run closer together which will in turn provide increased capacity. The Scheme will provide the capability to operate four ‘express’, two ‘semi-express’ services and up to two local services an hour on the Route and will provide increased flexibility to timetable more train paths.

7.4.7 Electrification of the Scheme would provide substantial environmental and sustainability benefits and is an investment in ‘greener’ energy technology. This supports Network Rail’s Decarbonisation Strategy and is bolstering national targets for reducing harmful emissions that cause climate change, which are set out in Government legislation for achieving net zero carbon by 2050.

7.4.8 The Order Scheme will also deliver improved safety through measures including replacement of two level crossings, installation of additional safety measures on existing bridges; enhancements to the local highway networks and new pedestrian crossing points at locations including Greenfield and Mossley Stations. Accessibility of the railway network will also be improved with the provision of fully accessible stations at Greenfield Station and the relocated Mossley Station. These measures are being brought forward as part of the wider TRU Scheme to electrify and modernise the Route, as facilitated, in part, by the reconstruction of Heyrod Hall Overbridge (MVL3/7).

7.4.9 Significant residual beneficial effects arising from the operation of the wider TRU Scheme have been previously identified in the Huddersfield-Westtown TWA Order Inquiry from December 2021. These included recognition of improved journey times, reliability,

and capacity at the Local Authority area and in turn the sub-regional and regional level. These improvements will bring direct significant benefits to local businesses and the labour market through improved access to the local regions along the section of the route from Stalybridge to Diggle.

7.4.10 To this effect, the proposals at Heyrod Hall Overbridge (MVL3/7) are therefore essential in achieving the overall substantial public benefits of Route Section W2B and wider objectives of the Order Scheme, and without these interventions, the Order Scheme would not be able to be safely and successfully implemented. Alongside these substantial public benefits, the delivery of heritage interpretation adjacent to Greenfield Station would enable public engagement with the heritage of the Huddersfield & Manchester Railway, its architecture and significance.

8. CONCLUSION

8.1.1 The significance of Heyrod Hall Overbridge (MVL3/7) lies primarily in its historical and architectural interest. The bridge is a largely unaltered example of an 1840s overbridge, dating from the Heroic Age (1841–50). The high quality of the bridge's architecture together with the quality workmanship of the construction is characteristic of A.S. Jee's work for the Huddersfield & Manchester Railway. The bridge also derives significance from this direct historical relationship with notable railway engineer A.S. Jee and the historic railway companies namely the Huddersfield & Manchester Railway and LNWR. The setting of Heyrod Hall Overbridge (MVL3/7) makes a minor contribution to the significance of the structure; it also possesses group value as one of a number of A.S. Jee structures on the Transpennine route which share a common design language.

8.1.2 A number of design options were pursued to achieve the clearance required for the OLE. The OLE is a fundamental part of the Order Scheme to deliver a faster service (reduced journey time) and to make provision for electrification and the operation of a 'greener' transport solution. The development of a scheme-specific pantograph which enables the use of reduced overhead line wire height under structures, subject to a site-specific risk assessment, has not resolved the clash between proposed OLE and the listed structure.

8.1.3 The first range of options were focused on the retention of the bridge and employing engineering solutions to facilitate the Order Scheme within the current physical confines of the structure. These options included:

1. Adjusting the vertical rail alignment through track lowering to provide adequate clearance for the required OLE through the arch of the structure.
2. Bridge jacking to increase the height of the arches over the lines to provide sufficient clearances.

8.1.4 However, as outlined in Section 6.2 these options did not meet with safety regulations, operational drivers and buildability. Local geology, topography and access constraints limit the feasibility of delivering the other options considered within the context of the operational railway corridor.

8.1.5 Options were then pursued which accepted the loss of the historic bridge and made attempts to achieve an optimum reconstructed bridge design solution that retained the relationship with the railway and to an extent compensated for the removal of the existing structure. This was done through material choices (use of natural stone cladding referencing the character of the existing bridge); ambition to salvage masonry from the demolished span for use to clad elements of the reconstructed bridge, formation of a horizontal feature line in the concrete edge beams to tie in with the retained section of string course.

8.1.6 The design process has been undertaken in a strongly collaborative manner and has sought historic environment professional support from the outset. The desire to maximise heritage benefits and limit harm was the primary position. Special regard has been given to the desirability of preserving or enhancing the structure or its setting or any features of special architectural or historic interest which it possesses. Every effort was made to retain this historic structure as part of the TRU. However, this was unachievable within the operational parameters set. Regular consultation with historic environment stakeholders and the design team were held throughout the design development process and several mitigation measures have been considered to attempt to avoid or reduce the impact on the significance of Heyrod Hall Overbridge (MVL3/7). Historic England and TMBC have accepted that the approach of reconstructing the structure is necessary to deliver the proposed Order Scheme, and that alternative approaches are not viable. The design development process, including engagement with historic environment stakeholders, resulted in mitigation being embedded within the design of the reconstruction as well as compensation measures being agreed, to be secured as conditions of the listed building consent (see Section 7.3).

8.1.7 With the reconstruction of Heyrod Hall Overbridge (MVL3/7), the Order Scheme can achieve key improvement objectives as outlined

in Section 7.4. It would also support the achievement of substantial public benefits related to:

- Improved efficiency and reliability of the railway (in journey time saving and increased capacity).
- Reduction of delays to trains and highway users (improved efficiency and larger freight containerisation of the Scheme Route means fewer heavy vehicles on the highway network causing traffic issues and contributing to air pollution).
- Supporting sustainable transport development in line with Network Rail's Decarbonisation Strategy.
- Improving public health and safety in providing safe routes across the railway.

8.1.8 In addition to this, the delivery of a programme of heritage interpretation at Greenfield Station would provide the opportunity for engagement of the public with the heritage of the Huddersfield & Manchester Railway.

8.1.9 The reconstruction of Heyrod Hall Overbridge (MVL3/7), which is a grade II listed building, would result in substantial harm to the significance of the listed building and should be considered exceptional. This would mean the loss of an irreplaceable piece of railway infrastructure, dating to the Heroic Age (1841-50) of railway building. It is also a loss to the collection of A.S. Jee bridges that are located along this section of the Transpennine route.

8.1.10 Whilst the reconstruction of Heyrod Hall Overbridge (MVL3/7) is regrettable its loss would be outweighed by the substantial public benefits that accrue from enabling the Transpennine programme to be achieved. The proposals therefore meet the requirements of the NPPF (paragraph 214) in relation to the justification for substantial harm. The proposals would also satisfy the requirements of the Tameside Unitary Development, namely policy C5 in relation to the design of the replacement deck and C8 with regard consideration given to the substantial demolition of the bridge. It would also satisfy Policy JP-P2 contained within Greater Manchester Combined Authority's Places for Everyone (2024). The proposals therefore satisfy both national and local policy requirements in relation to the justification for harm to the significance of Heyrod Hall Overbridge (MVL3/7).

National Grid Reference:	SJ9720099786

Summary

Road bridge over the Huddersfield & Manchester Railway line, mid-late 1840s, by A S Jee.

Reasons for Designation

Heyrod Hall Bridge (MVL3/7), constructed in the mid-late 1840s by A S Jee for the Huddersfield & Manchester Railway, is listed at Grade II for the following principal reasons:

Historic interest:

* Constructed during the heroic age of railway building and a little altered example of an 1840s overbridge on what is now one of the main railway lines in northern England;

* Designed by the notable railway engineer Alfred Stanistreet Jee.

Architectural interest:

* The bridge is well detailed with rusticated voussoirs, ashlar dressings, impost bands, and a parapet incorporating pyramidal coping stops that lift its design above the purely functional.

Group value:

* With the other listed structures designed by Jee on the Huddersfield & Manchester Railway line.

History

In contrast to the main trunk lines of the late 1830s that were constructed by single railway companies the route from Stalybridge to Leeds had fragmented origins and was the work of three different railway companies: the Huddersfield & Manchester Railway, Leeds, Dewsbury & Manchester Railway, and the Manchester & Leeds Railway.

The Huddersfield & Manchester Railway was authorised in 1845 and followed the route of the Huddersfield Narrow Canal for much of its length, including a railway tunnel through the Pennine hills set alongside the earlier Standedge Canal Company tunnel of 1811; in 1846 the railway company also acquired the canal. Joseph Locke and Alfred Stanistreet Jee were appointed to survey and design the new line, the two engineers having already worked together on a major project linking Manchester and Sheffield. Jee became the lead engineer for the Huddersfield line, which passed through challenging terrain, assisted by resident engineers that included his brother Moreland Jee (until 1848) and Herbert F Mackworth. Construction of the line was divided into various contracts, with many contractors being only responsible for a single cutting, viaduct or tunnel portal. The largest contract for the Standedge Tunnel between Diggle and Marsden was let to a single contractor, Thomas Nicholson in 1847. The tunnel's completion in 1849 marked the opening of the line.

The Leeds end of the route, which was also authorised in 1845, was constructed by the Leeds, Dewsbury & Manchester Railway. The engineer was Thomas Grainger who had previously largely worked in Scotland, and the line was completed in 1849.

A short three-mile section of the route between Heaton Lodge Junction and Thornhill Junction near Mirfield was developed by the Manchester & Leeds Railway and was constructed between 1837 and 1840, with George Stephenson as the chief engineer. The structures on this line were designed by Thomas Gooch under the oversight of Stephenson. In 1847 the railway company changed its name to the Lancashire & Yorkshire Railway.

In 1847 the Huddersfield & Manchester Railway and the Leeds, Dewsbury & Manchester Railway were acquired by the London & North Western Railway (LNWR) so that the company could access the city of Leeds and the textile towns of West Yorkshire. This pitted them as rivals to the Lancashire & Yorkshire Railway, although at points on the route the two companies had to work together. By 1851 the London & North Western Railway had an overall mileage of railway track of 800 miles and it became the most prominent railway company in the country and the largest joint-stock concern in the world in the late C19. Although the LNWR had a general manager, Captain Mark Huish, the lines of the

Stalybridge to Leeds route still managed their own affairs. LNWR later carried out expansion works, including the widening of tracks and bridges, the construction of additional tunnels, and station alterations. In 1923 the line became part of the London Midland & Scottish Railway, and subsequently part of the nationalised British Railways in 1948. The line, its structures and track are currently owned by Network Rail, and the passenger services operated by TransPennine Express and Northern Rail.

Heyrod Hall Bridge (MVL3/7) was designed by A S Jee and dates to the construction of the Huddersfield & Manchester Railway in 1845-9 (it is depicted on the 1st edition 1:10560 OS map published in 1848). The bridge was constructed to carry a private lane leading to Heyrod Hall over the railway line.

Details

Road bridge over the Huddersfield & Manchester Railway line, mid-late 1840s, by A S Jee. Rock-faced sandstone with ashlar dressings.

Heyrod Hall Bridge (MVL3/7) is located off Wakefield Road in Heyrod, a semi-rural settlement within the township of Stalybridge, and carries a short private lane leading to Heyrod Hall over the Huddersfield & Manchester Railway line. The bridge is similarly detailed on both sides and is constructed of coursed local sandstone with a segmental arched span incorporating rusticated voussoirs with tooled faces that springs from an ashlar impost band. Above the arch is a projecting carriageway band (designed like a stringcourse) and a low parapet of coursed stone with flat ashlar coping stones incorporating pyramidal stops. The projecting wing walls are splayed.

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the pre-application meetings over the last five months. These have been extremely useful in explaining the significance of the heritage assets, the design team's approach, and in exploring issues and constraints associated with electrifying the track.

This letter covers our advice regarding proposals for change to eight listed railway structures between Stalybridge and Standedge Tunnel, within the Metropolitan boroughs of Tameside and Oldham in Greater Manchester. This section of the railway is referenced as W2B.

Significance

The section of railway between Stalybridge and Standedge Tunnel was constructed in stages between 1844 and 1849. This was at the height of “railway mania”; an intense period of activity when many competing companies formed and were racing to complete sections of railway. The Stalybridge and Standedge Tunnel railway eventually became part of a wider network of sections of track that extends from Selby and York to Manchester Victoria via Leeds.

The W2B route has considerable heritage value. It traverses areas of dramatic landscape and varied geology, and has remained well preserved and largely unaltered since its opening in the 1840s. The wider railway network from the Yorkshire cities to Manchester contributed hugely to the economic and urban development of the North and was a major factor in the industrial revolution and in the development of towns.

Historic England

The tricky geology and terrain of the W2B route presented challenges to the engineers of the 1840s, and many of the most notable surviving features of the railway are the impressively engineered bridge and viaduct structures. These structures are predominantly built from locally sourced stone, meaning they harmonise with the landscape and contribute to local views, adding to the aesthetic value of the route. The significance of the structures also lies in the fact that they survive well and in large numbers. There have been few alterations to bridges, mainly because this section of the line has not been widened as other parts of the wider route have been.

There are eight listed railway structures that will be affected by the proposed electrification works between Stalybridge and Standedge Tunnel; these are:

- Heyrod Hall Overbridge - MVL3/7
- Heyrod Footbridge Overbridge - MVL3/8
- Spring Bank Lane Overbridge - MVL3/9
- Roughtown Road Overbridge - MVL3/17
- Wright's Mill Overbridge - MVL3/20
- Wright's Overbridge - MVL3/23
- Oldham Road Overbridge - MVL3/28
- Saddleworth Viaduct - MVL3/31

All eight of the listed structures were designed by notable railway engineer Alfred Stanistreet Jee, lead engineer for the railway between Huddersfield and Manchester. They were built in the mid-late 1840s and share many architectural characteristics, adding to their group value and enhancing their significance.

Bridges MVL3/7, MVL3/9, MVL3/17, MVL3/20, MVL3/23, and MVL3/28 are all very similar in design. All are made from coursed local sandstone and have segmental arches formed from tooled voussoirs, with larger keystones. Each has dressed ashlar impost bands, sloping string courses above the arch, and parapet copings, with shallow pyramidal caps to the slender piers. They have considerable group value and are easily identifiable in the landscape as bridges associated with the original construction of the railway. The bridges are all well designed and adapted to their individual locations, some being skewed or sloped. High quality workmanship and

https://www.historicengland.org.uk/terms/privacy-cookies/

details such as picked and tooled ashlar voussoirs elevate their design above what is purely function, enhancing their significance further.

Heyrod Footbridge (MVL3/8) and Saddleworth Viaduct (MVL3/31) are clearly recognisable as part of the same scheme of work but differ in their form. Heyrod Footbridge features a flat span, and retains its cast-iron edge beams and brick parapets, while Saddleworth Viaduct comprises 23 sandstone arches spanning the River Tame and Huddersfield Narrow Canal.

The structures are all Grade II listed in recognition of their special architectural and historic interest at national level. Saddleworth Viaduct was listed in 1986, while all seven overbridges were listed in 2017 or 2018 after a comprehensive review of the line.

Impacts

The proposals involve demolition and reconstruction of three structures, total removal of one structure, and modifications to four structures. These works are deemed necessary to achieve the clearance required for the OLE (overhead line equipment) and to ensure safety for bridge users. The impacts of proposed works at each structure are discussed below.

Bridges requiring demolition works:

Heyrod Hall Overbridge MVL3/7 carries a short section of private road over the railway to Heyrod Hall. This bridge is in a rock cutting with very hard rock beneath the track, prohibiting track lowering.

Wright's Mill Overbridge MVL3/20 carries the public footpath and bridleway over the railway where it passes through a steep-sided rock cutting. Options to lower the track at this bridge have been investigated but discounted due to the location on the bridge in a rock cutting with very hard rock beneath. Track lowering would also have a knock-on effect to a nearby underbridge.

Oldham Road Overbridge MVL3/28 is a skew overbridge located on the north-east side of Greenfield Station and carries Oldham Road over the track below. There will be

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

the addition of a new footbridge alongside the reconstructed road bridge. Options to lower the track at this bridge have been investigated but would be difficult to achieve due to the proximity to the station.

Proposals at these three bridges involves the complete dismantling of each bridge and reconstruction to create a raised, flat deck with sufficient clearance for OLE. Stone would be reclaimed and used to clad the inside faces of parapet walls; however matching stone is likely to be needed to clad the external sides of the parapets. New copers would also be needed to ensure parapets were the correct height.

The demolition and reconstruction of these bridges will cause substantial harm to their significance through the total loss of historic form and loss of much of their original fabric. The proposals will also diminish the group value of the historic bridges on the railway.

Wright's Overbridge MVL3/23 is a footbridge that carries a public footpath from north-west to south-east across the railway. The railway here is in a steep cutting and due to gradients, the bridge slopes down towards the south-east. Proposals involve the total removal of this bridge and diversion of the public right of way across the railway at another point.

The removal of Wright's Overbridge will cause substantial harm to its significance through the total loss of its historic form and all original fabric. Its removal will necessitate the re-routing of a historic public footpath, which is part of a network of paths in the area connecting mills and farms with workers' housing, and contributes to the landscape character of the area and to the setting of the bridge. The proposals will also further diminish the group value of the historic bridges on the railway.

Bridges requiring modifications:

Heyrod Footbridge Overbridge MVL3/8 carries a footpath running east-west over the railway, with steps on the eastern side down to a path running south-east towards Spring Bank Lane which are also listed.

Spring Bank Lane Overbridge MVL3/9 (also known as Heyrod Bridge) carries Spring Bank Lane over the railway. Due to the lie of the land the bridge slopes down towards the east. The splayed projecting wing walls are also covered by the listing.

Historic England is subject to both the Freedom of Information Act (2000) and Environmental Information Regulations (2004). Any information held by the organisation can be requested for release under this legislation.
We respect your privacy and the use of your information. Please read our full privacy policy for more information
https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

Roughtown Road Overbridge MVL3/17 carries Roughtown Road north-south across the railway, to the east of Mossley Station. Due to gradients the deck slopes down towards the south. The projecting wing walls are also covered by the listing.

Minimal interventions are proposed at these three bridges, the most significant changes being the introduction of new triangular copers to ensure the correct and safe parapet heights.

The introduction of triangular copers to raise the parapet heights to 1.5m will result in a low level of less than substantial harm to the significance of the bridges through the changes to their appearance and the loss of original copers. This harm could be further lowed by using stone copers instead of concrete, and by undertaking any other restoration works required such as replacing the recently rendered section of parapet copings in the south-west corner of Roughtown Road Bridge.

Saddleworth Viaduct MVL3/31 (also known as Uppermill Arches and Uppermill Viaduct) carries the railway over a series of roads and lanes, and the River Tame and Huddersfield Narrow Canal. Due to the lack of space available on the viaduct deck, proposals here involve attaching brackets to the exterior of the viaduct for the OLE supports.

The proposed works at Saddleworth Viaduct will result in a low level of less than substantial harm to the significance of the structure through the change to its appearance and in the physical impact on the elevations of the viaduct from the brackets. This harm could be further lowed by ensuring the spacing of the masts responds to the structural and architectural rhythm of the viaduct to lessen their visual impact.

Policy

National policy relating to the conservation and enhancement of the historic environment is articulated in section 16 of the National Planning Policy Framework (NPPF, 2023). These policies state that heritage assets are an irreplaceable resource and should be conserved in a manner appropriate to their significance, so they can be enjoyed for their contribution to the quality of life of existing and future generations (NPPF para 195). Also, when considering the impact of a proposed development, great weight should be given to an asset's conservation (NPPF para 205).

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification (NPPF 206).

Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss. In practice this means that less harmful alternative solutions should be explored through the pre-application and application processes.

In addition to section 16 of the NPPF, we refer you to Section 12 'Achieving well-designed and beautiful places' when considering the design for replacement bridge structures. Para 132 states that being sympathetic to local character and history is important, along with a consistent and high-quality standard of design (para 133).

Position

The proposed works to upgrade the W2B section of the Transpennine route network will be the first major programme of work since its construction in the 1840s. The wider public benefits of the upgrade work to this key transport network will be vast and will have positive knock-on effects across the region. The challenging geology and hydrology across the route still present issues to engineers today, and we welcome the work that has gone into investigating alternative options to demolition and reconstruction for the bridges affected.

The proposals will result in substantial harm to the significance of bridges MVL3/7, MVL3/20, MVL3/23, and MVL3/28, with the highest level of harm to bridge MVL3/23 which will be dismantled and not reconstructed. The proposals will cause harm through the loss of the form of the arched bridges and though the loss of historic fabric. There will be the additional harm to the group value of the bridges.

We agree that the bridges are predominantly experienced from the bridge deck, and that re-use of original fabric should be focussed on the inside faces of the parapet walls to ensure the look of the bridge when crossing it is not unacceptably altered, however this re-use of materials does not lower the harm to less than substantial levels. It will be for decision takers to weigh the balance of this substantial harm against the public benefits of the scheme.

Historic England

Works to bridges MVL3/8, MVL3/9 and MVL3/17 is largely limited to raising the parapets to ensure they are the safe and correct height. We acknowledge that Network Rail has a legal obligation to take reasonable steps to prevent people from coming into contact with the OLE by ensuring parapets cannot be climbed or walked on. We appreciate the work undertaken to investigate various options for different types of pantographs to limit the height at which the parapets need to be raised to. The use of triangular copers will introduce a change in the appearance of the bridges and cause a low level of less than substantial harm to their significance, but the impact can be lessened by use of stone rather than concrete copers which will be less visually obtrusive. Parapet design should be tailored to the individual circumstances of each bridge to ensure the least harmful solution is used.

There will also be a low level of less than substantial harm at Saddleworth Viaduct from the introduction of brackets to the structure to support the OLE. This can be further lowered by thoughtful spacing of the brackets.

We welcome the detailed options appraisals undertaken during the design of the proposed works to listed structures on the W2B route. We recommend that details are finalised using bespoke designs that respond to the particular character of each structure and its setting.

Next Steps

Thank you for involving us at the pre-application stage of this project. The above advice is the response that we would give if the same proposals were put forward unamended for statutory approval.

Yours sincerely

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the meeting on 27 August to review the proposals for bridges MVL3/7, 8, 17 and 20. It was useful to see the drawings in advance and then talk through the proposals with the team.

The significance of the affected structures has been set out in our letter of 25 June 2024 and won't be repeated here. The impacts of the proposed changes and our comments are detailed below:

MVL3/7 - Heyrod Hall Overbridge
The changes to this bridge involve demolition and reconstruction of the bridge deck and sections of the abutments, resulting in substantial harm to the significance of the bridge. The bridge is built from coursed local sandstone, and the voussoirs have been lightly tooled around the edges to give them definition and add interest to the arch. The proposed changes will result in the total loss of the historic form of this bridge and much of the original fabric.

In order to reduce harm, every care should be taken when demolishing the bridge so as much original undamaged stonework as possible can be retained for re-use. Where new stonework is needed, this should be as close a match as possible to the original stone, and courses should match up to minimise the visual impact of the works. We welcome the use of natural cut stone copers.

MVL3/8 - Heyrod/Springbank Lane Footbridge
The appearance of this bridge will change slightly through the introduction of new copers which will increase parapet height. The use of natural stone will help to minimise the appearance of the new copers and mean they were be less obvious. Overall, there will be a very low level of less than substantial harm to this bridge.

MVL3/17 - Roughtown Road Overbridge
This is another bridge where the proposals involve the introduction of new copers

Historic England

which will increase parapet height. The changes here will be more noticeable than at MVL3/8 but still constitute a low level of less than substantial harm.

In order to minimise harm, it will be necessary to carefully design the ends of the new sections of coping stones to manage how they interact with the piers of the bridge. The piers are topped by shallow pyramidal caps, which currently form a prominent feature of the bridge's architecture. There is a danger that the definition of these caps will become lost if the new copers butt up to them. This mitigation could be achieved by either terminating the new copers short of the piers, or by raising the height of the pier caps so they remain prominent.

Additional mitigation should involve repairs to the fabric of the parapet walls, including removal of the cement kerb section and bollards, which will no longer be needed once the road is one-way.

MVL3/20 - Wright's Mill Overbridge
The proposals for demolition and reconstruction of this bridge will result in a substantially altered structure and substantial harm to the significance of the listed asset.

The historic form and materials of this bridge are very similar to MVL3/7, and the proposed construction works are also comparable, however the proposed parapet at MVL3/20 will be noticeably taller due to the bridge's use as a bridleway. The proposal drawings show the ends of the new copers sharply sloping down towards the piers of the bridge.

As advised with MVL3/17 above, care should be taken in the design and integration of these copers so they complement the existing structure and do not appear overly obvious. As with MVL3/7, we advise that every care should be taken when demolishing the bridge so as much original undamaged stonework as possible can be retained for re-use. Where new stonework is needed, this should be as close a match as possible to the original stone, and courses should match up to minimise the visual impact of the works.

Next Steps

I look forward to reviewing the next series of proposals for other parts of the scheme.

Yours sincerely

Louise Davies

Our ref: PA01200823
18 July 2025

Dear Sarah

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the recent meetings to review the draft Heritage Statements that will be submitted for Listed Building Consent applications for changes to bridges on the proposed Transpennine Route Upgrade line.

The Heritage Statements are well considered and it is clear that alternative options to reconstruction have been investigated in each case, which are helpfully set out in tables in the reports. The proposals will result in substantial harm to listed bridges along the route, however clear justification for this has been set out in the Heritage Statements.

We very much welcome the inclusion of heritage interpretation at Greenfield Station. This is a significant early rail route and there is notable educational potential in the material that has been generated from the research into the railway structures as part of this project.

Regarding Oaklands Road underbridge MVL3/25, we are comfortable with the design of the proposals for the reconstruction of the parapet and stone turrets. These have been carefully considered to minimise the visual impact.

Next Steps

We appreciate having been involved at pre-application stage in this important project, and value being able to feed into design plans. If you require further pre-application advice please get in touch.

Yours sincerely

1. INTRODUCTION

1.1 Transpennine Route Upgrade

1.1.1 The Transpennine Route Upgrade (TRU) is a major, multi-billion pound program of improvements to increase capacity, improve journey time and reliability performance of rail services on the Transpennine Route.

1.1.2 The TRU will aim to deliver:

- An improved journey time for Leeds – Manchester Victoria of 42-44mins;
- An improved journey time for York to Manchester Victoria of 65-67mins;
- Capability to operate four 'express' and two 'semi-express' services an hour;
- Capability to operate up to two 'local services' an hour on the route;(subject to future operating timetables);
- Performance of the Transpennine Route to be 92.5% or higher each period;
- Larger freight containerisation capability (W12 gauge);
- Freight paths/rights to be retained as existing; and
- A contribution to Network Rail's Decarbonisation Strategy and climate policy.

1.1.3 The Network Rail (Stalybridge to Diggle (Saddleworth) Enhancements) Order extends from Stalybridge Tunnel, in the west, through to the eastern portal of Standedge Tunnel (the "Order Scheme"). This section of the Transpennine route follows the Tame Valley from Stalybridge to Diggle, and is referred to hereafter as Route Section W2B.

1.1.4 The TRU programme in Route Section W2B involves a variety of works including the electrification of the railway (installation of overhead line equipment (OLE) and associated infrastructure), reconstruction and modification of existing bridges to facilitate electrification of the railway, construction of a new station at Mossley, closure of Stockport Road Level Crossing and Moorgate Halt Level Crossing, railway works at Greenfield Station to support the upgrade and electrification of the railway track reconfiguration works and track lowering works through Stalybridge and Scout Tunnels.

1.1.5 Under the Planning (Listed Buildings and Conservation Areas) Act 1990, consent is required from the local planning authority for any proposed works that would affect the character of a Listed Building. The Transport and Works Act 1992 introduced section 12(3A) into the Planning (Listed Buildings and Conservation Areas) Act 1990, the effect of which is to "call-in" for determination by the Secretary of State applications to the local planning authority for listed building consent where such consent is required in consequence of proposals included in an application for a Transport and Works Act Order (TWAO). The procedures in the Transport and Works Applications (Listed Buildings, Conservation Areas and Ancient Monuments Procedure) Regulations 1992 then apply to the call in of such listed building consent applications.

1.1.6 This Heritage Statement has been compiled in support of an application for listed building consent by Network Rail in respect of the proposed works on the grade II listed Springbank Lane Footbridge (MVL3/8) (NHLE 1452382). This bridge is located in the village of Heyrod (NGR SD 97332 00110), approximately 3.6 km east of Ashton-Under-Lyne. A location plan is provided in Appendix A.

1.1.7 The Historic England list description (included in full in Appendix B) names the listed building as “Railway Overbridge MVL3/8, Springbank Lane Footbridge”. Throughout this Heritage Statement the structure is referred to as “Springbank Lane Footbridge (MVL3/8)” in accordance with Network Rail’s naming of the structure.

1.1.8 The preparation of this assessment has been informed by the Statement of History and Significance: West of Leeds (Alan Baxter Associates, 2024) and the Route-wide Statement of Significance (Alan Baxter Associates, 2019).

1.2 Scope

1.2.1 The requirement for assessment and its scope is guided by policy contained within the National Planning Policy Framework (NPPF 2025) specifically paragraph 207, which seeks an assessment proportionate to the importance of the affected heritage asset and sufficient to understand the potential impacts of development. The specific scope of this assessment is determined by Network Rail’s requirement to provide an objective assessment of the heritage value of assets that may be affected by the Order Scheme, and to appraise the nature and extent of any impact upon setting and significance.

1.2.2 This Heritage Statement will seek to:

- Identify and discuss the heritage significance of the listed structure, including the contribution of setting;
- Present the design requirements of the Order Scheme at the structure;
- Present the process of development and optioneering which has led to the design proposal for the Order Scheme in relation to the structure;
- Identify the impacts of the design proposal on the significance of the structure, in the context of current national and local planning policy and guidance;
- Discuss any mitigation recommended in relation to the structure; and
- Consider the public benefits to be gained from the Order Scheme weighed against the impact on the significance of the structure, in line with the National Planning Policy Framework, 2024 (MHCLG, 2024) and the Tameside Unitary Development Plan Written Statement, 2004 (Tameside Metropolitan Borough Council, 2004).

1.3 Current Conditions

1.3.1 Springbank Lane Footbridge (MVL3/8) (Insert 1-1) was originally built in the mid to late 1840s by A. S. Jee for the Huddersfield & Manchester Railway, and was reconstructed in the later 19th century. The footbridge is situated on the eastern peripheries of the small settlement of Heyrod, which is located c. 3.6 km east of Ashton-under-Lyne, and consists of narrow flat span that crosses over the two-track railway line of the Transpennine route.

1.3.2 The structure was subject to a visual examination as part of Network Rail's maintenance regime in 2020, which notes that 'significant defects were present on this structure' (Network Rail, 2020). These defects include:

- Open joints and loose masonry (Insert 1-2);
- Vegetation rooted in fractures to the jack arch and abutments; and
- Bulging stonework.

Insert 1-1 Springbank Lane Footbridge (MVL3/8) south elevation in the foreground

Insert 1-2 Springbank Lane Footbridge (MVL3/8), open joints and fractures to approach walls

1.4 Summary of proposal

1.4.1 In order to achieve the TRU programme objectives, electrification of the route is required. This would require the alteration of a number of existing bridges, including Springbank Lane Footbridge (MVL3/8) to accommodate Overhead Line Equipment (OLE). Following optioneering, it has been determined to be necessary to undertake a minor track lower, like for like repairs to the structure and retain and raise the parapet of Springbank Lane Footbridge (MVL3/8) (option 1). These works would therefore enable implementation of the Order Scheme.

2. LEGISLATION AND POLICY CONTEXT

2.1 Legislation

2.1.1 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) ("Act") governs the designation and works to listed buildings in England.

2.1.2 The Act states in s.1 (5):

'In this Act "listed building" means a building which is for the time being included in a list compiled or approved by the Secretary of State under this section; and for the purposes of this Act—

a) any object or structure fixed to the building;

b) any object or structure within the curtilage of the building which, although not fixed to the building, forms part of the land and has done so since before 1st July 1948, shall be treated as part of the building.'

2.1.3 Under the Act, no one is permitted to undertake or cause to be undertaken any works that would affect the character of a listed building unless the works are authorised. Section 16 of the Act identifies that whether such works can be carried out is determined by the local planning authority or the Secretary of State:

'(1) Subject to the previous provisions of this Part, the local planning authority or, as the case may be, the Secretary of State may grant or refuse an application for listed building consent and, if they grant consent, may grant it subject to conditions.

(2) In considering whether to grant listed building consent for any works the local planning authority or the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses.

(3) Any listed building consent shall (except in so far as it otherwise provides) ensure for the benefit of the building and of all persons for the time being interested in it.'

2.1.4 In relation to the granting of listed building consent, Section 17 of the Act stipulates that conditions attached to listed building consent may include those with respect to:

a) *' the preservation of particular features of the building, either as part of it or after severance from it;*

b) *the making good, after the works are completed, of any damage caused to the building by the works; [and]*

c) *the reconstruction of the building or any part of it following the execution of any works, with the use of original materials so far as practicable and with such alterations of the interior of the building as may be specified in the conditions'.*

2.1.5 It is also defined in s.17 (2) that a condition 'may also be imposed requiring specified details of the works (whether or not set out in the application) to be approved subsequently by the local planning authority or, in the case of consent granted by the Secretary of State, specifying whether such details are to be approved by the local planning authority or by him'.

2.1.6 The Act also states in s.66 (1):

'In considering whether to grant planning permission or permission in principle for development which affects a listed building or its setting, the local planning authority or, as the case may be, the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses'.

2.2 National Policy

2.2.1 The National Planning Policy Framework (NPPF, 2025) sets out the Government's planning policies for England and how these should be applied to contribute to the achievement of sustainable development, supported by the Planning Practice Guidance on the Historic Environment (updated July 2019) (MHCLG, 2019).

2.2.2 Section 2 of the NPPF outlines the principles of achieving sustainable development including, in Paragraph 8, an environmental objective 'to protect and enhance our natural, built and historic environment'. Paragraph 9 sets out that these objectives should be delivered through the preparation and implementation of plans and the application of the policies within the NPPF. Section 16

of the NPPF deals specifically with the historic environment. Where changes are proposed, the NPPF sets out a clear framework to ensure that heritage assets are conserved, and where appropriate enhanced, in a manner that is consistent with their significance.

2.2.3 This Heritage Statement aims to address relevant policy within the NPPF in relation to Section 16 'Conserving and enhancing the historic environment' and includes guidance on plan making, managing Historic Environment Records; how to determine proposals affecting the historic environment; and how to consider potential impacts on significance.

2.2.4 The following paragraphs as set out in the NPPF include key provisions considered of particular importance to this application:

- Paragraph 207 – '*In determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand* the potential impact of the proposal on their significance.'
- Paragraph 212 – '*When considering the impact of a proposed development on the significance of a designated heritage asset, great weight should be given to the asset's conservation (and the more important the asset, the greater the weight should be). This is irrespective of whether any potential harm amounts to substantial harm, total loss, or less than substantial harm to its significance.'*
- Paragraph 213 – '*Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification. Substantial harm to or loss of:*

  a) grade II listed buildings, or grade II registered parks or gardens, should be exceptional;

  b) assets of the highest significance, notably scheduled monuments, protected wreck sites, registered battlefields, grade I and II listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional.'*
- Paragraph 214 – '*Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss, or all of the following apply:*

a) *the nature of the heritage asset prevents all reasonable uses of the site; and*

b) *no viable use of the heritage asset itself can be found in the medium term through appropriate marketing that will enable its conservation; and*

c) *conservation by grant-funding or some form of not for profit, charitable or public ownership is demonstrably not possible; and*

d) *the harm or loss is outweighed by the benefit of bringing the site back into use.'*

- Paragraph 215 – *'Where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate, securing its optimum viable use.'*
- Paragraph 216 – '*The effect of an application on the significance of a non-designated heritage asset should be taken into account in determining the application. In weighing applications that directly or indirectly affect non-designated heritage assets, a balanced judgment will be required having regard to the scale of any harm or loss and the significance of the heritage asset.'*
- Paragraph 219 - '*Local planning authorities should look for opportunities for new development within Conservation Areas and World Heritage Sites, and within the setting of heritage assets, to enhance or better reveal their significance. Proposals that preserve those elements of the setting that make a positive contribution to the asset (or which better reveal its significance) should be treated favourably.'*

Planning Practice Guidance: Historic Environment

2.2.5 The Planning Practice Guidance (PPG) (MHCLG, 2019) provides further advice and guidance that expands the policy outlined in the NPPF. It expands on terms such as 'significance' and its importance in decision making. The PPG clarifies that being able to properly assess the nature, extent and the importance of the significance of the heritage asset and the contribution of its setting, is very important to understanding the potential impact and acceptability of development proposals (paragraph 008 Reference ID: 18a-008-20190723).

2.2.6 The PPG states that in relation to setting, a thorough assessment of the impact on setting needs to take in to account, and be

proportionate to, the significance of the heritage asset under consideration and the degree to which proposed changes enhance or detract from that significance and the ability to appreciate it (paragraph 009 Reference ID: 18a-009-20190723).

2.2.7 The extent and importance of setting is often expressed by reference to visual considerations. Although views of or from an asset will play an important part, the way in which an asset is experienced in its setting is also influenced by other environmental factors such as noise, dust and vibration from other land uses in the vicinity, and by our understanding of the historic relationship between places.

2.2.8 Paragraph 013 of the PPG recognises that the contribution that setting makes to the significance of the heritage asset does not depend on there being public right or the ability to experience that setting. When assessing any application for development which may affect the setting of a heritage asset, local planning authorities may also need to consider the implications of cumulative change (Paragraph: 013 Reference ID: 18a-013-20190723 Revision date: 23 07 2019).

2.2.9 In relation to substantial harm, the PPG states that 'it is the degree of harm to the asset's significance rather than the scale of the development that is to be assessed' (paragraph 017). Harm to heritage assets can be avoided or minimised if proposals are based on a clear understanding of the heritage asset and its setting (paragraph 008 Reference ID: 18a-008-20190723). The NPPF indicates that the degree of harm should be considered alongside any public benefits that can be delivered by development.

2.3 Local planning policy

Tameside Unitary Development Plan

2.3.1 The Tameside Unitary Development Plan (2004) is part of the statutory Local Plan policies for Tameside Metropolitan Borough which provides the set of planning policies which make up the current local plan.

2.3.2 The Tameside Unitary Development Plan sets out local planning policies that 'provide a framework for development and conservation over the whole of the Tameside area, to set out the main considerations on which planning applications in the Borough are determined, and to guide land use decisions by the Council and other agencies.'

2.3.3 Policies within the framework which are relevant to this Heritage Statement are outlined below.

Policy C Conservation and Enhancement of the Built Environment.

Policy C1 Townscape and Urban Form

In considering proposals for built development, the Council will *expect the distinct settlement pattern, open space features, topography, townscape and landscape character of specific areas of the Borough to be understood, and the nature of the surrounding fabric to be respected. The relationship between buildings and their setting should be given particular attention in the design of any proposal for development.*

Urban design frameworks will be produced for particular areas and corridors in the Borough, as supplementary planning guidance, setting out fundamental principles which should be followed and from which detailed design may be interpreted.

The Council will establish a strategy to secure the retention and enhancement of landmark buildings which form a distinctive element of the local skyline or townscape, and which represent a unique part of the heritage of the area. Re-use and conversion of such buildings which become redundant will be permitted, subject to other relevant policies.

Policy C5 Alternative Uses, Alterations and Additions for Listed Buildings

Whilst continuation of the use for which the building was designed is most desirable, the Council will permit alternatives uses for Listed Buildings where evidence demonstrates that the existing or original use is unlikely to support the maintenance and preservation of the building.

The Council will require that proposed new uses, or other alterations and additions to Listed Buildings, should not adversely affect the essential character of the building, should be in keeping with its architectural style and features, and should harmonise with its surroundings. The effect of the proposals on any protected species which may be using the Listed Building should also be taken into account.

Such development must be of a high standard of design. The external appearance, design and materials will be expected to match as near as possible those of the existing building and, where appropriate, new internal features should also harmonise with the existing.

Extensions and additions should be secondary in scale, design and location to the principal building and standard solutions or modern

features which fail to relate to the character of the building will not be permitted

Policy C6: Setting of Listed Buildings

New development, including any proposed as a result of a new use for a Listed Building, which fails to preserve, or detracts from, the setting of a Listed Building or structure will not be permitted.

Policy C8 Demolition of Listed Buildings

The Council will not recommend the demolition of Listed Buildings, apart from in exceptional circumstances after the following considerations have been assessed:

a) the condition of the building and the cost of repairing and maintaining it in relation to its importance and to the value derived from its continued use, and

b) the adequacy of efforts that have been made to retain the building in its present use or to find compatible alternative uses, and

c) the merits of alternative proposals for the site.

In such circumstances the Council will also need to be satisfied that an acceptable alternative form of development can go ahead on the site as soon as practical following demolition, that any use of the building by protected species has been taken into account, and that provision can be made to record the detail of the building prior to demolition.

Places for Everyone (Greater Manchester Combined Authority 2024)

2.3.4 Places for Everyone (Greater Manchester Combined Authority 2024) is a joint development plan covering nine Greater Manchester districts including Tameside, setting out a framework for sustainable development. Policy JP-P2 concerns Heritage and is of *relevance to this assessment:*

Policy JP-P2: Heritage

We will proactively manage and work with partners to positively conserve, sustain and enhance our historic environment and heritage assets and their settings. Opportunities will be pursued to aid the promotion, enjoyment, understanding and interpretation of heritage assets, as a means of maximising wider public benefits and reinforcing Greater Manchester's distinct character, identity and sense of place.

Local Plans will set out the key elements which contribute to the district's identity, character and distinctiveness and which should be the priority for conserving and enhancing in the future and demonstrate a clear understanding of the historic environment and the heritage values of sites, buildings or areas and their relationship with their surroundings. This knowledge should be used to inform the positive management and integration of our heritage by:

Setting out a clear vision that recognises and embeds the role of heritage in place-making;

Ensuring that the heritage significance of a site or area is considered in accordance with national planning policy in the planning and design process and opportunities for interpretation and local engagement are optimised;

Integrating the conservation and enhancement of heritage assets and their settings, with creative contextual architectural responses that contribute to their significance and sense of place;

Delivering positive benefits that sustain and enhance the historic environment, as well as contributing to the economic viability, accessibility and environmental quality of a place, and to social wellbeing; and

Exploring opportunities to reduce greenhouse gas emissions that restoration of historic buildings offer.

Particular consideration will be given to ensure that the significance of key elements of the historic environment which contribute to Greater Manchester's distinctive identity and sense of place are protected from harm. These include historic town centres, places of worship, historic transport routes including the canal network, industrial buildings and structures including textile mills, farmsteads and other sites, buildings, and areas of identified archaeological, architectural, artistic and/or historic value. Development proposals affecting designated and non-designated heritage assets and/or their settings will be considered having regard to national planning policy. Where heritage assets have been identified as being at risk, Local Plans should identify specific opportunities for them to contribute to regeneration and place-making, and they should set out strategies for their repair and re-use. Development proposals which will help safeguard the significance of and secure a sustainable future for Greater Manchester's heritage at risk will be supported in principle, provided they are not contrary to national policy or other policies in the development plan. Proposals should be informed, as necessary, by the findings and recommendations of the appropriate heritage assessment(s) in the development plan evidence base

and/or any updated heritage assessment submitted as part of the planning application process.

Historic England Guidance

2.3.5 Historic England has published a series of Good Practice Advice (GPA) notes and Advice Notes (AN) of which those of most relevance to this appraisal are GPA2 – Managing Significance in Decision-taking (Historic England, 2015), GPA3 – The Setting of Heritage Assets (Historic England, 2017), and AN12, Statements of Heritage Significance (Historic England, 2019).

2.3.6 GPA2 – Managing Significance in Decision-taking emphasises the importance of having a knowledge and understanding of the significance of heritage assets likely to be affected by the development and that the 'first step for all applicants is to understand the significance of any affected heritage asset and, if relevant the contribution of its setting to its significance' (paragraph 4). Early knowledge of this information is also useful to a local planning authority in pre-application engagement with an applicant and ultimately in decision making (paragraph 7).

2.3.7 GPA3 – The Setting of Heritage Assets provides advice on the setting of heritage assets. Setting is as defined in the NPPF and comprises the surroundings in which a heritage asset is experienced. Elements of a setting can make positive or negative contributions to the significance of an asset and affect the ways in which it is experienced. Historic England state that setting does not have a boundary and what comprises an asset's setting may change as the asset and its surrounding evolve. Setting can be extensive and particularly in urban areas or extensive landscapes can overlap with other assets. The contribution of setting to the significance of an asset is often expressed by reference to views and the GPA in paragraph 11 identifies those views, such as those that were designed or those that were intended, that contribute to understanding the significance of assets.

2.3.8 AN12, Statements of Heritage Significance outlines a recommended approach to assessing the significance of heritage assets in line with the requirements of NPPF. It includes a suggested reporting structure for a 'Statement of Heritage Significance', as well as guidance on creating a statement that is proportionate to the asset's significance and the potential degree of impact of a proposed development. The AN also offers an interpretation of the various forms of heritage interest that an asset can possess, based on the terms provided in the NPPF Glossary (Annex 2); namely archaeological, architectural, artistic, and historic.

3. ASSESSMENT METHODOLOGY

3.1 Research

3.1.1 In accordance with Historic England guidance and as determined by policy requirements, this assessment identifies the baseline heritage interest of Springbank Lane Footbridge (MVL3/8). The historical narrative informing the baseline has been derived from a review of various resources including maps and other cartographic and photographic sources. Statutory information in relation to the designated assets has been obtained from the National Heritage List for England maintained by Historic England and the Historic Environment Record maintained by Greater Manchester Archaeology Advisory Service.

3.1.2 Additional information concerning the assets, their condition, use and setting has been obtained from a survey undertaken by suitably qualified and experienced heritage specialists on 21 and 22 May 2024, including observation from surrounding vantage points and informed by appraisal and observation derived from close working with other disciplines within the project team.

3.2 Significance and setting

3.2.1 Assessment of the significance of heritage assets and their setting has been undertaken in consideration of guidance issued by Historic England (Historic England, 2017 and 2019).

3.2.2 Significance is often established by statutory designations such as listed buildings, scheduled monuments and conservation areas. More particular advice as to what makes up significance is set out in AN12, which establishes a method for thinking consistently about the heritage values that can be ascribed to a place. When making an assessment of significance, numerous aspects are considered including architectural interest, historic interest, group value, social value, former uses and local distinctiveness. These aspects are grouped into four values defined in the NPPF as historical interest, archaeological interest, artistic interest, and architectural interest.

3.2.3 In assessing whether the setting of an asset contributes to its significance, and in assessing the effect of development, Historic England GPA3 provides a checklist of attributes that may affect setting and significance under five broad categories comprising:

- The location and siting of the development.
- The form and appearance of the development.
- Additional effects (change to skyline etc.).

- Permanence.
- Consequential effects.

4. CONSULTATION

4.1.1 Historic England and Tameside Metropolitan Borough Council (TMBC) have been involved in ongoing stakeholder consultation with Network Rail through the development of Route Section W2B of the TRU.

4.1.2 Regular meetings with Historic England and TMBC have been held to discuss the significance of Springbank Lane Footbridge (MVL3/8) and the alignment of the railway as well as the design development of this structure. Initial meetings were held periodically throughout 2021 and resumed in 2024 to discuss the overall Route and design development for all listed structures along Route Section W2B.

4.1.3 The design development of the Order Scheme in relation to Springbank Lane Footbridge (MVL3/8) was discussed during meetings with the statutory stakeholders on the dates outlined in Table 4 1 below:

Table 4-1 Consultation for Springbank Lane Footbridge (MVL3/8)

Date	Stakeholder in attendance	Key agreements/items discussed

12 January 2021	• TMBC
	• Historic England
		• Presentation of options to stakeholders comprising:
		  • Track lower and retention of Springbank Lane Footbridge (MVL3/8) and Springbank Lane Overbridge (MVL3/9); and
		  • Reconstruction of Springbank Lane Footbridge (MVL3/8) and Springbank Lane Overbridge (MVL3/9).
		• Track lowering identified to be preferred option for Historic England.

2 February 2021	• TMBC • Historic England	• Historic England highlighted their desire for retention of the structure and need for a strong and clear justification if replacement is proposed. Balance of this harm against public benefit of the proposals was also noted.
2 March 2021	• TMBC	• Preferred option for Springbank Lane Footbridge (MVL3/8) identified to comprise retention of the structure with a track lower and parapet raise (option 1).
May 2021	• Historic England • Oldham Metropolitan	• Overview of the structures along Route Section W2B which are of historic interest, including the grade II overbridges and underbridges which are noted for their inherent significance, particularly as essential railway structures. The

Date	Stakeholder in attendance	Key agreements/items discussed
	Borough Council (OMBC) • Kirklees Council	group value of the bridges was identified as a key contributor to significance. • Presentation of the purpose of Heritage Statements and their assessment of impact with the emerging GRIP 3 designs. • Early-stage recommendations to minimise harm to significance against the requirements for justification of proposals and opportunities to pursue sensitive design and compensation. • Reassurance was provided to the councils that they would be involved in the GRIP 3 design process which would be used within the detailed design development of GRIP 4 (Single Option Development). Clarification was also provided on the sustainable heritage initiatives. • Historic England stated that they expect to get an understanding of significance at this stage and that they anticipate options to be shared for comment. Also stressed the importance of minimising harm.
22 June 2021	• TMBC	• Review of track lowering and bridge reconstruction options with TMBC.
25 January 2022	• TMBC	• Update provided to TMBC officers on design development for Springbank Lane Footbridge (MVL3/8). • Parapet height requirements noted to be 1.8m above the bridge deck. • Discussion of the balance of harm against the public benefit delivered by the TRU.
22 June 2022	• TMBC	• Review of optioneering for Springbank Lane Footbridge (MVL3/8).
6 February 2024	• Historic England	• Details of the challenges of the electrification of the Route in relation to listed overbridges were presented. Design measures under consideration for addressing these challenges noted to include: • Reduced voltage clearances: • Development of scheme-specific pantograph, reducing electrical clearances to a minimum. • Site specific risk assessments of bridges due to reduced overhead wire heights. • Electrical protection works: • Risk-based approach to raising parapets. Where safe to do so, 1.5m height parapets may be employed, rather than standard 1.8m height. • This approach has been embedded in designs for W2B.

Date	Stakeholder in attendance	Key agreements/items discussed
		• Example images of recently installed steeple copers were shared, and the potential for colouring of the concrete copers was noted. • The design approach for electrification across / under existing railway bridges was noted to have agreed in principle by Network Rail and following consultation with the Local Authorities & Historic England at the preceding design stage.
5 March 2024	• Historic England	• Network Rail presented the discussion around retention and reconstruction of the group of listed structures in which Springbank Lane Footbridge (MVL3/8) would be retained.
19 March 2024	• TMBC	• Meeting to discuss the electrical protection works to the seven listed structures, including Springbank Lane Footbridge (MVL3/8). Principles of electrification works were presented and included the use of a risk-based approach to reduce the impact to the existing structures. • The proposed works Springbank Lane Footbridge identified that the current parapet height of 1.5m is sufficient for electrification and therefore works would include refurbishment of the footbridge, replacing the copers with triangular concrete copers to prevent loitering on the parapet as well as anti-trespass fences. • The council queried whether natural stone could be used instead of concrete for the copers to be more in keeping with the character of the structure.
9 April 2024	• Historic England	• Presentation of revised proposals for Springbank Lane Footbridge (MVL3/8) comprising retention of structure, welcomed by Historic England.
5 May 2024	• TMBC	• Presentation of proposals for listed structures along Route Section W2B to TMBC conservation officer including electrical protection works and approach to overbridge reconstruction. • Preference for use of stone copers for listed bridges emphasised by TMBC.
7 May 2024	• Historic England	• Electrical protection works comprising parapet raising at Springbank Lane Footbridge (MVL3/8) agreed in principle by Historic England.
14 May 2024	• TMBC	• Presentation of revised proposals for Springbank Lane Footbridge (MVL3/8) to TMBC officers comprising: • Retention of grade II listed asset; Raising of existing parapet to 1.5m using steeple copers; and repairs to jack arch, parapet and cast-iron beams.

Date	Stakeholder in attendance	Key agreements/items discussed

24 May 2024	• TMBC	• This meeting was used to outline to members of the Local Planning Authority (following changes in personnel) the significance of Springbank Lane Footbridge (MVL3/8), and identified the requirements for intervention in order to accommodate the electrification. The works therefore included:
		  • Replace existing copers with triangular concrete copers;
		  • Reinstate fencing to lighting columns to reduce trespass; and
		  • Refurbishment of the footbridge.
		• The council expressed their preference of natural stone instead of concrete for the proposed triangular copers.

25 June 2024	• Historic England	• Pre-application advice letter from Historic England (see Appendix C for the full letter) identifies in relation to Springbank Lane Footbridge that:
		  • Works are largely limited to raising of the parapet height.
		  • Acknowledge that NR have a legal obligation to prevent contact with OLE and ensure parapets cannot be climbed or walked upon. Investigation into various option acknowledged.
		  • Use of stone rather than concrete copers preferred.
		  • Parapet design should be tailored to each bridge.

15 July 2024	• TMBC	• Written response from TMBC on proposed alteration of listed railway bridges identifying the following requirements relevant to Springbank Lane Footbridge (MVL3/8):
		  • Proposed works to listed bridges should be kept to the minimum necessary to facilitate the Order Scheme and ensure their continued use and enjoyment, whilst retaining as much as practicable of their individual character and appearance.
		  • Any replacement stonework and/or new stonework (copings, for example) should be in natural stone.
		  • All new stonework at bridge level should respect the colour, texture, form to the existing and follow the same coursing pattern.
		  • Any application for listed building consent should be supported by a Heritage Statement prepared in accordance with the NPPF.
		  • Listed building consent drawings to clearly identify on plan and in a methodology / specification details all works including repair work, fencing for all bridges, and

Date	Stakeholder in attendance	Key agreements/items discussed
		to include the extent of reconstruction of MVL3/7 and MVL3/20.
27 August 2024	• Historic England	• Design presented to Historic England in meeting, agreed that impact only changes the profile of the copers from flat top to steeple. • Assessed as overall minor works.

17 September 2024	• Historic England	• Extended pre-application advice letter from Historic England (see Appendix C) identifies that:
		  • The appearance of the bridge would change slightly from new copers and increased parapet height.
		  • Natural stone would minimise appearance of new copers
		  • Overall very low level of less than substantial harm

28 March 2025	• TMBC	• Review of draft heritage statements for structures including Springbank Lane Overbridge (MVL3/9). • Inclusion of Historic England's formal responses within the Heritage Statements requested. • Need for clear identification of public benefits of the scheme in the heritage statements identified. • TMBC confirmed that construction methodology as set out in the heritage statement was sufficient for consenting purposes.
4 April 2025	• Historic England	• Overview of draft comments from Historic England. Request to draw out the heritage interpretation in the reports as part of the heritage benefits.
6 May 2025, 14 May 2025, 21 May 2025, 29 May 2025	• TMBC	• Emails sent to TMBC regarding updated proposals for attachment of a parallel flange channel to Springbank Lane Overbridge (MVL3/9) and inclusion in the listed building consent application. Confirmation received that listed building consent application should encompass the parallel flange channel only, and not the wider retaining wall
18 July 2025	• Historic England	• Pre-application advice letter received from Historic England providing overarching feedback on proposals affecting listed bridges between Stalybridge and Standedge Tunnel (see Appendix C). • Acknowledgment given to the collaborative approach taken at pre-application stage, to fully explore alternative options to reconstruction and for the opportunity for Historic England to feed into design plans. • The heritage statements adjudged to be well considered with clear justification having been provided for the substantial harm identified to those structures proposed for removal or reconstruction.

Date	Stakeholder in attendance	Key agreements/items discussed
		• The inclusion of interpretation at Greenfield Station is welcomed by Historic England.

5. HERITAGE ASSSETS AND THEIR SIGNIFICANCE

5.1 History of the W2B Transpennine Route

5.1.1 The railway connecting Stalybridge to Huddersfield, which runs under Springbank Lane Footbridge (MVL3/8) was constructed by the Huddersfield & Manchester Railway Company between 1846 and 1849. The mid-1840s was a period of commercial confidence and massive expansion in the railway network across England, known as 'Railway Mania' which has been described by Historic England as the Heroic Age of railway building (Historic England 2017b). Between 1845 and 1852 the railway network expanded from 2,345 miles to 7,272 miles (3774 km to 11,703 km) (Alan Baxter Associates, 2019). Constructed at the height of this boom, the Stalybridge to Leeds Line was a product of this trend. Traversing a challenging landscape through the Pennines, the line was planned to follow the route of the Huddersfield Narrow Canal for much of its length, with the canal acquired by the Railway Company the year after the railway's authorisation (Alan Baxter Associates, 2019). These difficult landscape conditions resulted in the need to build several major viaducts and tunnels. This included Standedge Tunnel through the Pennines, which was constructed alongside the 1811 canal tunnel and is 'indisputably significant as a major engineering achievement' (Alan Baxter Associates 2024).

5.1.2 The development and expansion of the railways during the 19th century transformed the landscape and settlements through which they passed, fuelling industrial growth and settlement expansion. The impact of improved communications, first with the arrival of the canal in 1811, and then the railway in 1849, provided valuable links with Huddersfield, Manchester and Leeds, enabling import of raw materials and export of manufactured goods. This fuelled the gradual industrialisation and settlement expansion along the Tame Valley. This can be seen on historic Ordnance Survey maps dating from the 19th and early 20th century where industrial development including mills, dyeworks, printworks and quarries, is shown to have been present along the route of the railway and extending into the more upland areas around Saddleworth and Harrop Dale, whilst settlements such as Mossley and Dobcross gradually expanded.

5.1.3 Springbank Lane Footbridge (MVL3/8) was first constructed in the mid to late 1840s for the Huddersfield & Manchester Railway Company. The principal engineer for the Huddersfield & Manchester Railway was Alfred Stanistreet (A. S.) Jee (1816–1858), who was assisted by the more renowned engineer Joseph Locke (1805–1860). Jee's work on the Huddersfield & Manchester Railway represents, arguably, his greatest achievement. This can be seen particularly in the construction of the Standedge Tunnel, which at over three miles long was one of the longest and most difficult in England, but also through the various large-scale viaducts along the route. In the 1850s, he worked internationally on the Spanish line from Alar-del-Rey to Reynosa where his skill in design, his accuracy and his completeness of the details earned him high praise. He died in a fatal accident upon the opening of the second portion of that line.

5.1.4 In 1847, prior to the opening of the line, the Huddersfield & Manchester Railway Company was taken over by the London and North Western Railway (LNWR). As part of the LNWR network, the Huddersfield & Manchester Railway formed part of a direct route from Manchester to the West Riding, enabling the LNWR to access the textile and coal industries of West Yorkshire. By 1851, the LNWR was the most prominent railway company of the period, with over 800 miles of track and was the largest joint-stock concern of its time, capitalised at £29 million. The line was acquired by the London Midland and Scottish Railway in 1923, before being nationalised in 1948.

5.1.5 Whilst other parts of the Transpennine route were subject to significant alterations, the Huddersfield & Manchester Railway between Standedge Tunnel and Stalybridge was subject to relatively limited alteration. The Micklehurst Loop was constructed from 1881-85 to provide additional capacity, and diverged from the existing railway to the east of the Tame Vally, avoiding physical interaction with the majority of its alignment. A new junction to the south of Greenfield Station is shown on historic maps from the early 20th century as additional tracks toward Oldham were established from this station. However similarly to the Micklehurst loop, the additional lines diverged from the main Huddersfield line, running westwards at its intersection with Shaw Hall Bank Road Footway (MVL3/26). The railway was also widened to the east of Diggle to accommodate additional tracks serving new bores for the Standedge Tunnel which were added in 1868-71 and 1894, necessitating widening of bridges to the east of the route.

5.1.6 Piecemeal change has occurred on the Huddersfield & Manchester Railway, most notably with the closure of a small number of stations along the route, such as Diggle and Saddleworth Stations. The route today forms part of the wider Transpennine route between York,

Selby and Manchester, which comprises sections of rail line developed by different railway companies.

5.1.7 The history and significance of the Transpennine route is discussed at more length in the Route-Wide Statement of Significance (Alan Baxter Associates, 2019). This was produced to characterise the overall heritage significance of the Transpennine route as a whole.

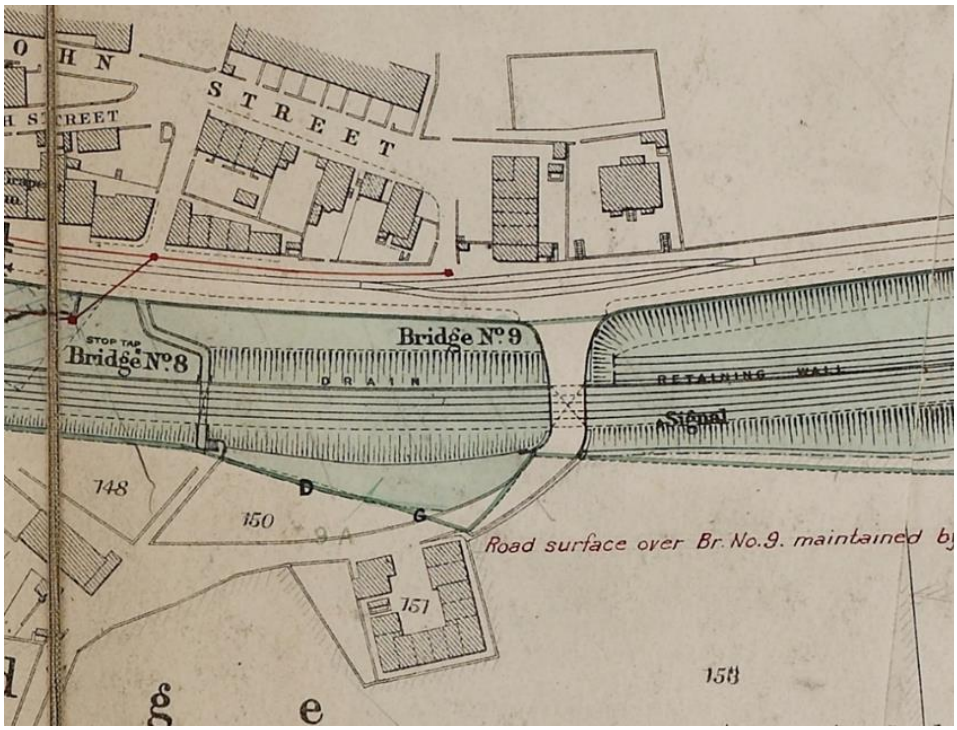
5.2 Springbank Lane Footbridge (MVL3/8)

History

5.2.1 Springbank Lane Footbridge (MVL3/8) was constructed between 1845 and 1849 during the Heroic Age of railway building. The single-span bridge was originally designed by A.S. Jee for the Huddersfield & Manchester Railway and provided pedestrian access east-west across the valley.

5.2.2 The 1st edition Ordnance Survey map of 1845 depicts the footbridge crossing of the 'London and North Western Railway', connecting Heyrod with nearby farmstead at Spring Bank, the Hartshead Print Works and Spring Grove Mill within a semi-rural landscape. Mapping from the 20th century (1938 Six-inch Ordnance Survey onwards) reveals the environs of the bridge to have remained largely unchanged, despite some alterations occurring within this local landscape, including the demolition of the Hartshead Print Works. The establishment of the large-scale Hartshead Power Station c. 85m east of Springbank Lane Footbridge from the mid-1910s and particularly the presence of the two cooling towers from the 1940s formed prominent elements within the setting of the footbridge until their demolition in the 1980s.

5.2.3 An undated drawing held by Network Rail reveals the partial reconstruction of the bridge, likely during the late 19th century (Insert 5-2). The drawing shows that the bridge deck was replaced using second-hand cast-iron girders from a structure in Walsall, cut down to fit the abutments of Springbank Lane Footbridge (MVL3/8). The insertion of girders, tie rods and jack arches and an additional layer of concrete topped with asphalt raised the level of the footway by ten inches, necessitating the insertion of an additional step at the east end of the bridge. It is possible that these alterations were undertaken in the later 19th century, as suggested by the use of blue engineering bricks for the parapets which were in common use by this time. The raising of the footway at this time also included the insertion of the two drainage channels along the borders of the footpath.



Insert 5-1 Springbank Lane Footbridge (MVL3/8) from the historic line plan held by Network Rail, 1905

Description

5.2.4 Springbank Lane Footbridge (MVL3/8) comprises a single span cast iron girder footbridge over the railway.

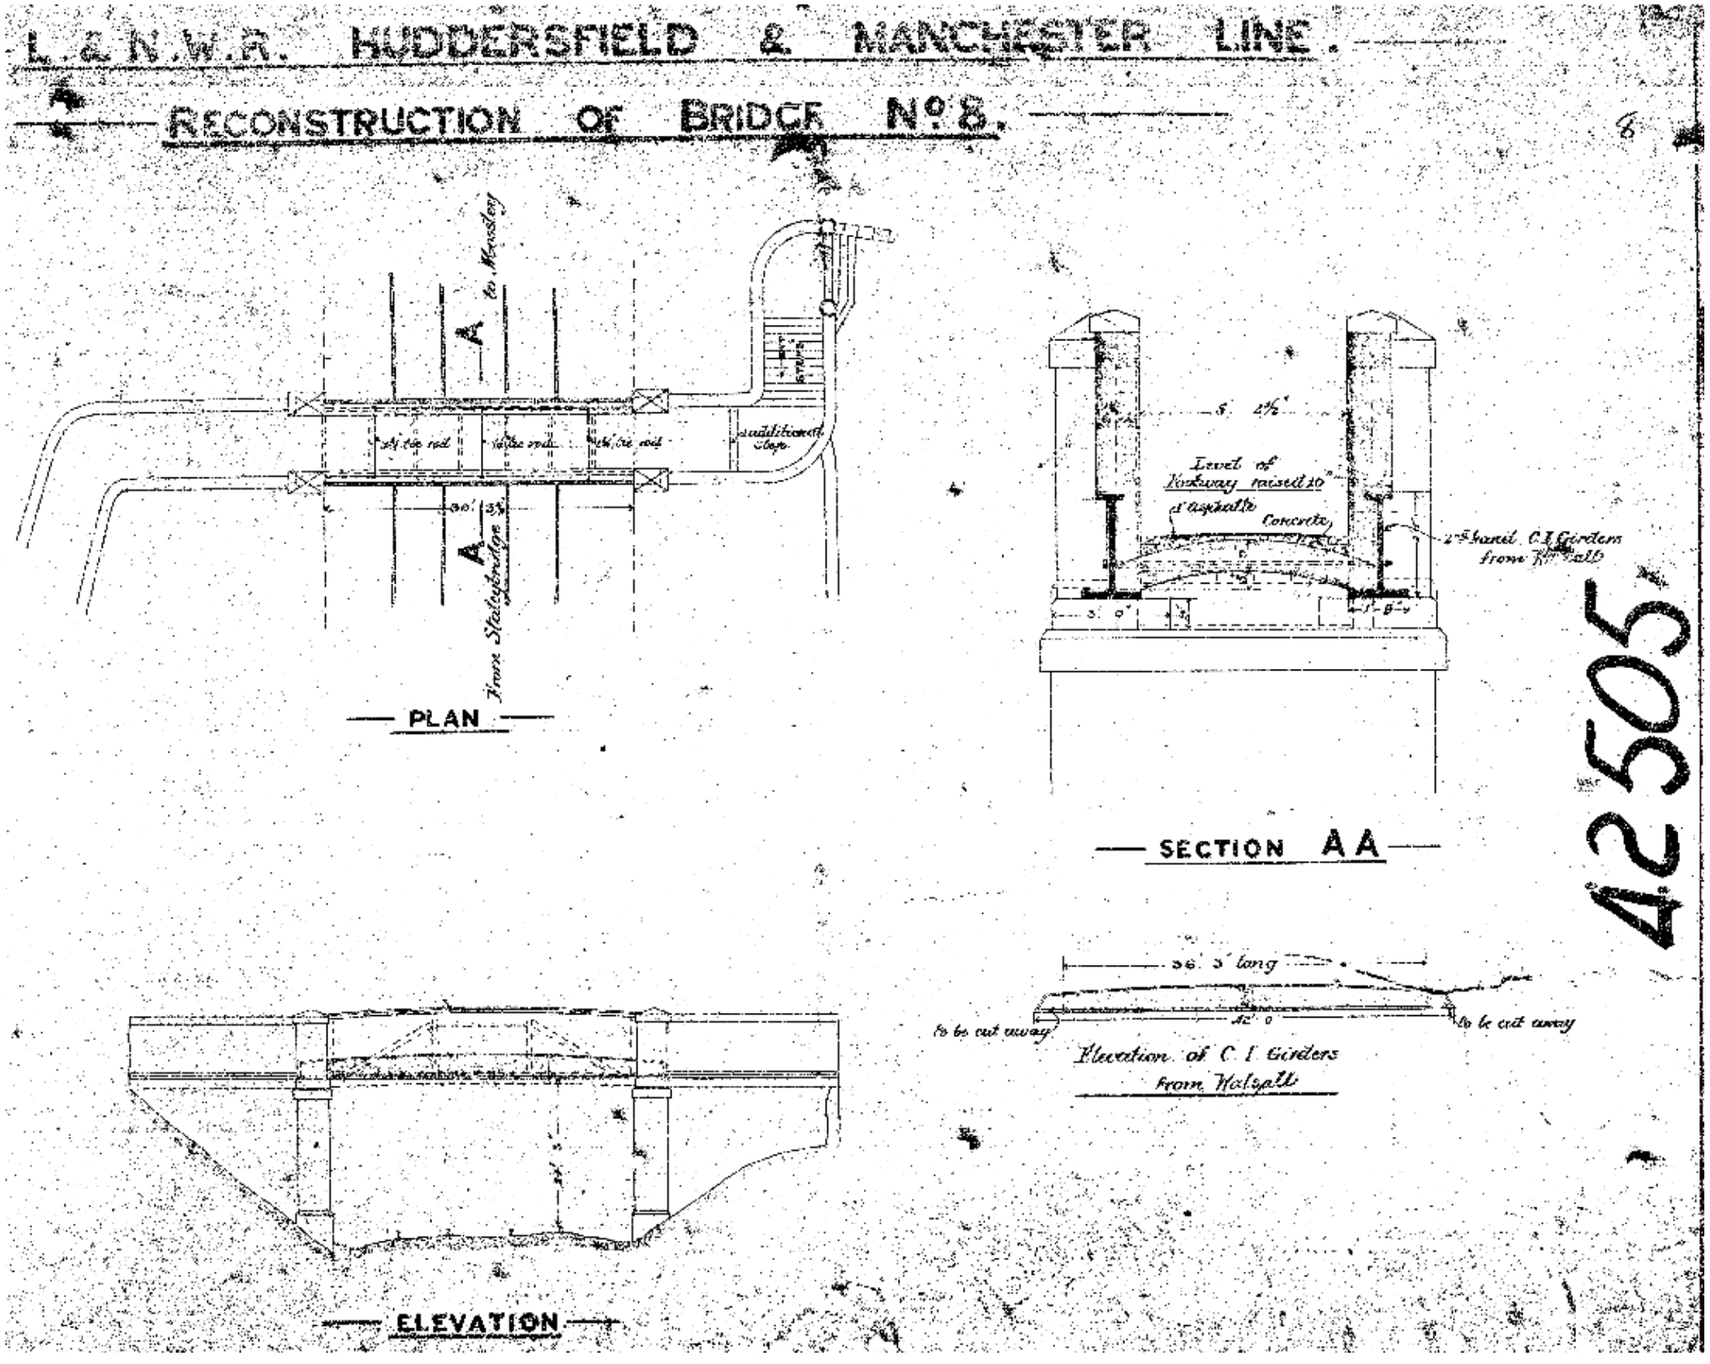
5.2.5 The footbridge comprises two cast-iron girders with a brick jack arch spanning between the bottom flanges and supporting a mass concrete fill bridge deck (Insert 5-3). Battered quarry-faced stone abutments encase the bridge and a weathered plinth is topped by an ashlar stone band. The parapets are constructed in blue engineering brick topped with flat stone copers, resulting from reconstruction in the later 19th century (Insert 5-2). The brick parapets may replace an original cast iron balustrade and retain some evidence for late 19th and early 20th century alterations. The current concrete and asphalt deck surface also likely results from alterations in the late 19th century as evidenced by Network Rail archival drawings (Insert 5-2 and Insert 5-4).

5.2.6 Projecting piers are present at all four of the inner corners which have quoins with flush returns linking them below the bridge span. These piers have parapet imposts, three ashlar steps and pyramidal caps which are highly weathered. The distinctive curved approach walling of the bridge is formed by random coursed squared stone with punched hog's-back copings and projecting band at the base. The bridge deck surface is topped with modern tarmac.

5.2.7 The bridge is accessed from the east via a long footpath from Spring Bank Lane which is constructed of short landings of sandstone setts divided by flights of three shallow steps with setted treads and flagstone risers, all of which are well-worn (Insert 5-5). This footpath forms part of the listed structure. The footpath leads to steep steps enclosed by a curving northern wall with circular posts that are punch dressed with a domed top (Insert 5-6). On the western extent of the bridge there is also a winding enclosed footpath connecting the footbridge with Wakefield Road (Insert 5-7).

5.2.8 The setting of Springbank Lane Footbridge (MVL3/8) is somewhat localised given the nature of the topography and landscape surrounding the structure. Views of the structure and its position spanning the Transpennine route are possible from Wakefield Road to the west, whilst views from the bridge deck provide a visual connection to Springbank Lane Overbridge (MVL3/9) located to the north. Views towards of the northern elevation of the footbridge are also appreciable from Springbank Lane Overbridge (MVL3/9) which evidences its relationship with the railway.

5.2.9 The landscape setting of the bridge is semi-rural, comprising a mixture of historic and modern residential buildings and woodland, with long views to the surrounding Pennines. The footpaths framing the approach to the bridge from the east and west gradually reveal views of the bridge and its setting due to the local topography and curving path. As such, the setting of the footbridge is a contributing factor to its overall significance



Insert 5-2 Engineering drawing setting out the reconstruction of Springbank Lane Footbridge (MVL3/8), undated from the historic plans held by Network Rail

Insert 5-9 View south from the parapet of Springbank Lane Footbridge (MVL3/8).

Significance

5.2.10 Springbank Lane Footbridge (MVL3/8) was designated as a grade II listed building in 2018. The Historic England List Entry description identifies the bridge to be of special interest for to the following reasons:

- Historic interest:
    - Constructed during the Heroic Age of railway building and a relatively little-altered example (retaining cast-iron edge beams) of an 1840s footbridge on what is now one of the main railway lines in northern England.
    - Designed by the notable railway engineer Alfred Stanistreet Jee.
- Architectural interest:
    - The bridge is well-detailed with impost bands, a parapet incorporating pyramidal-capped pillars, and large circular gateposts leading to a well-constructed stepped footpath, that lift its design above the purely functional.
- Group value:
    - With the other listed structures designed by Jee on the Huddersfield & Manchester Railway line, in particular Heyrod Bridge (NHLE 1449241) (Springbank Lane Overbridge (MVL3/9)).

5.2.11 Springbank Lane Footbridge (MVL3/8) is of significance as an example of an 1840s footbridge. It was originally constructed during

the Heroic Age (1841–50) of railway building and the period of 'railway mania' which marked a time of commercial confidence and expansion in the railways. The bridge's direct historic relationship with historic railway companies of the period, comprising the Huddersfield and Manchester Railway and LNWR, and the notable railway engineer A. S. Jee, who also designed similar structures along the route, give the structure historical value from which it derives significance. The bridge remains in use as a part of the operational railway network and, together with surviving contemporary structures, evidences the historic infrastructure of the Huddersfield & Manchester Railway.

5.2.12 Documentary evidence reviewed as part of this project has identified evidence for reconstruction of the bridge using cast iron beams from another structure in the late 19th century. This reveals Springbank Lane Footbridge (MVL3/8) to have been subject to significant alteration, contrary to the NHLE assessment of it as a little altered structure. Despite these changes, Springbank Lane Footbridge (MVL3/8) retains evidence of the high-quality workmanship and attention to detail which is characteristic of Jee's work for the Huddersfield & Manchester Railway. This can be seen in the distinctive narrow curved parapet walling, with use of varied stone walling techniques and styles on the bridge abutments and approaches. The use of dressed stone, coping and decorative return quoins adds further architectural interest to the bridge. The quality of design and construction evident in the pilasters and wing walls elevates the overall visual expression of the footbridge to become a structure that is more than merely functional. The replacement of the bridge deck reusing cast iron beams from an earlier structure to create a flat span evidences the evolution of the structure under the LNWR and the incorporation of fabric from other LNWR-owned structures.

5.2.13 The setting of Springbank Lane Footbridge (MVL3/8) makes a minor contribution to the structure's overall significance. Though its setting has undergone changes since the mid-19th century, the footpaths to the east and west communicate the historic function of the structure, linking across the railway line and enhances the approach to and from the bridge and overall appreciation of the footbridge. The approaches enable for pockets of intervisibility between the bridge and footpath, whilst views of the bridge along the railway line allow for an appreciation of its relationship with the railway and Springbank Lane Overbridge (MVL3/9) which contribute towards its group value and setting. The contribution that setting makes towards the significance of Springbank Lane Footbridge (MVL3/8) is minor.

Group value

5.2.14 As identified in the list description, Springbank Lane Footbridge (MVL3/8) is recognised to be of group value with other listed structures by A.S. Jee on the Huddersfield & Manchester Railway[1]. These comprise:

- Heyrod Hall Overbridge (MVL3/7) (grade II listed, NHLE 1449242);
- Springbank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (grade II listed, NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405);
- Wrights Mill Overbridge (MVL3/20) (grade II listed, NHLE 1452406);.
- Wright's Bridge Overbridge (MVL3/23) (grade II listed, NHLE 1452409);
- Royal George Underbridge (MVL3/25) (grade II listed, NHLE 1451848);
- Shaw Hall Bank Road Footway (MVL3/26) (grade II listed, NHLE 1451852);
- Oldham Road Overbridge(MVL3/28) (grade II listed, NHLE 1451853);
- Wickens Underbridge (MVL3/29) (grade II listed, NHLE 1451854);
- Uppermill Viaduct (MVL3/31) (grade II listed, NHLE 1068120);
- Slaithwaite Viaduct (MVL3/61) (grade II listed, NHLE 1224049);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);
- Milne Viaduct (MVL3/76) (Longwood Viaduct) (grade II listed, NHLE 1220121).;
- Church Street (MVL3/82) (grade II listed, NHLE 1452083);

[1] Wheatley's Overbridge (MVL3/103) (grade II listed NHLE 1450537**)** was designed by A.S. Jee for the Huddersfield & Manchester Railway. Consent was granted for extensive change to the overbridge as part of the Huddersfield to Westtown (Dewsbury) Order section of the Transpennine Route Upgrade. The overbridge will be demolished and replaced with a new structure (ref 2021/91337). This is likely to result in de-listing. As such its contribution to group value has therefore been excluded from this assessment.

- Huddersfield Viaduct (MVL3/92) (grade II listed, NHLE 1223531);
- Hillhouse Lane Underbridge (MVL3/94) (Willow Lane East) (grade II listed, NHLE 1432641); and
- B6118 Colne Bridge Road Overbridge (MVL3/107) (grade II, NHLE 1450265)[2].

5.2.15 Whilst the architectural detailing of Springbank Lane Footbridge (MVL3/8) is unique amongst these assets, the group value which Springbank Lane Footbridge (MVL3/8) derives from these relationships provides an understanding of the wider trends and engineering achievement which characterise both the Huddersfield & Manchester Railway and the Heroic Age (1841–50) of railway building more generally. This group value is enhanced by the structures continuing to form part of the operational railway; as a collective group of assets, they are experienced by those following the rail line (traveling on it, or near it) as coherent features of a single historic route.

5.3 Surrounding heritage assets

5.3.1 The location of the designated and non-designated heritage assets discussed below are shown in Appendix A.

Designated heritage assets

5.3.2 There are a total of four listed buildings present within a 250 m buffer of Springbank Lane Footbridge (MVL3/8). These comprise:

- Springbank Lane Overbridge (MVL3/9) (grade II listed as Heyrod Bridge, NHLE 1449241), located c. 75 m north of Springbank Lane Footbridge (MVL3/8).
- Holly Cottage (grade II listed, NHLE 1309347), a late 18th century back-to-back double gabled terraced house, located c. 54 m northwest of Springbank Lane Footbridge (MVL3/8).
- 14, 16 and 18 John Street (grade II listed, NHLE 1163008), comprising three terraced houses all of which have three storeys (located c. 81 m northwest of Heyrod Overbridge (MVL3/8.

[2] B6118 Colne Bridge Road Overbridge (MVL3/107)) (grade II, NHLE 1450265) will be partially demolished and rebuilt with a supplementary structure replacing its spans over the railway. Listed building consent has been granted for this considerable intervention (ref: 2021/91330), and as a result may limit the contribution that this bridge makes towards the group value with the Jee bridges.

- Moorfield House (grade II listed, NHLE 1356467), a late 18th century house, located c. 179 m south-west of Springbank Lane Footbridge (MVL3/8).

5.3.3 The most pertinent designated heritage asset to Springbank Lane Footbridge (MVL3/8) is Springbank Lane Overbridge (MVL3/9) (NHLE 1449241) which forms a grade II listed single span arch railway overbridge. As a result of the clear and open nature of the railway tracks, and its location sunk into the railway cutting, views north from the footbridge are channelled towards the southern façade of Springbank Lane Overbridge (MVL3/9). These uninterrupted views emphasise the prominence of the overbridge within the setting of Springbank Lane Footbridge (MVL3/8), reinforcing the legibility of the structure's ties to historic transportation networks.

5.3.4 The grade II listed Holly Cottage (NHLE 1309347) comprises a pair of late 18th century double-depth terraced houses, one bay in width which are located c. 50 m south-west of the overbridge. Principal views from the cottages look to the south, towards a series of later cottages ranged along John Street. The rear (north) elevation is largely blind and does not enjoy significant views. The east gable looks across the railway line and bridge, with casement windows present to either side of the elevation. Springbank Lane Footbridge (MVL3/8) may be visible in oblique views from the gable end however does not form a prominent element within these views and does not contribute to the significance of Holly Cottage.

5.3.5 None of the remaining designated heritage assets, 14,16, and 18 John Street (NHLE 1356467 and Moorfield House (NHLE 1356467) within the 250 m study area are considered relevant to Springbank Lane Footbridge (MVL3/8) either in terms of historical relationship, shared intervisibility or proximity.

Non-designated heritage assets

5.3.6 The Greater Manchester Historic Environment Record (HER) records four non-designated heritage assets within 250 m of Springbank Lane Footbridge (MVL3/8) all of which duplicate the listed buildings identified in above.

5.3.7 Not recorded within the local Historic Environment Record but considered a non-designated heritage asset within its own right, is the abandoned remains for the Hartshead Power Station. It is considered relevant to the proposed Order Scheme at Springbank Lane Footbridge (MVL3/8) principally through the relative proximity and the bridge's former use in supporting access to that power station (despite this not being its original purpose). The Greater Manchester Historic Landscape Characterisation survey (Redhead,

2012) indicates that the Hartshead Power Station operated east of Heyrod from 1926 until it was demolished in the 1980s; some buildings survive (HGM44414; HGM44566). It is shown on early 20th century Ordnance Survey mapping. Infrastructure associated with the power station, including the water coolers, were built immediately south-east of the footbridge, extending the site to cover approximately 26 acres (Wharton-Street and Young, 2019). The power station was decommissioned in 1979 and the cooling towers demolished. The site is now disused and covered by woodland, screening it from surrounding areas. There is limited opportunity for glimpsed views of the power station from the bridge. Due to the recessed nature of the bridge within the railway and undulating topography, there are no views of the bridge from the power station site.

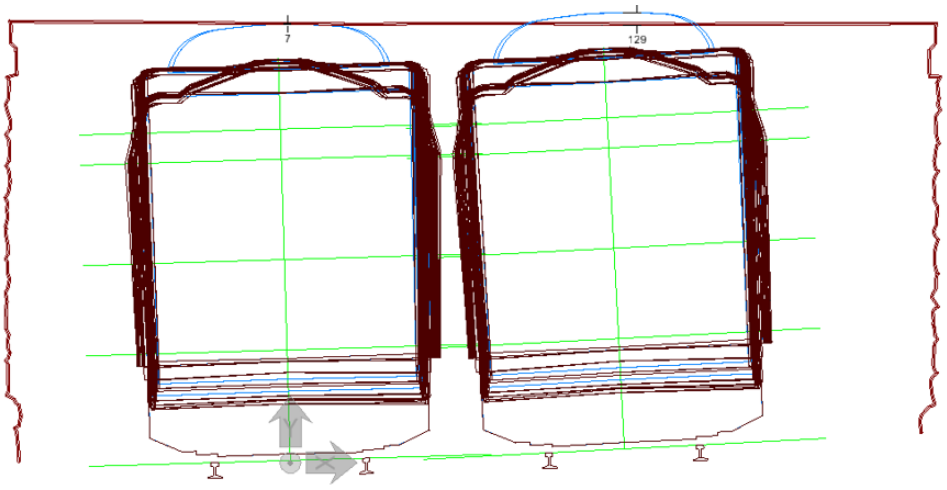
6. PROPOSALS

6.1 Background to proposals

6.1.1 In order to achieve the TRU programme objectives of improving journey times, capacity, overall reliability and resilience, and delivering environmental benefits, the electrification of the railway line and achievement of increased line speed is required. This necessitates the installation of OLE along the Route Section W2B .

6.1.2 Inadequate clearances to safely install OLE has been recognised as a challenge across much of the TRU, preventing the installation of overhead lines below some existing overbridges. To reduce the requirement for intervention into structures along the route as far as possible, a scheme-specific pantograph has been developed which enables the use of reduced overhead line wire height under structures, subject to a site-specific risk assessment. A number of structures along the route also do not provide adequate gauge clearance for the required freight trains on the route, the requirement for which has been considered as part of the design development process.

6.1.3 Insert 6-1 shows that even with use of the scheme-specific pantograph, there would still be significant clash between OLE and Springbank Lane Footbridge (MVL3/8). Works to enable the electrification of the railway at this site were therefore identified. Similarly, the bridge does not have the required freight gauge clearance. A process of design optioneering to identify the optimal solution has been undertaken.



Insert 6-1 Drawing showing the clash between existing Springbank Lane Footbridge (MVL3/8) and proposed pantograph level

6.2 Design development and justification

6.2.1 Design development for Springbank Lane Footbridge (MVL3/8) has taken into consideration a number of factors including the significance of the listed structure, operational requirements and constructability. The design development process has also involved engagement with Historic England and TMBC (as detailed above in Table 4-1). This iterative and robust process ensures the rigorous exploration of available options, incorporating multi-disciplinary review and ongoing engagement with the heritage consultees.

Optioneering

6.2.2 Based on Network Rail's extensive experience delivering comparable schemes, five options were identified for consideration at Springbank Lane Footbridge (MVL3/8). As introduced in 6.1, the option of retaining Springbank Lane Footbridge (MVL3/8) without undertaking any works would prevent the delivery of the Order Scheme. This option was therefore discounted at an early stage. The remaining four options comprised:

1. Track Lower - Lowering the height of the track to achieve the required headroom while retaining existing bridge.
2. Bridge Jacking - Increasing the height of the bridge through structurally lifting the deck up from the abutments. This would require cuts to be made to separate the deck from the abutments, lifting of the deck, infilling of the resulting gaps and refacing.

3. Bridge Reconstruction – Removal of the bridge deck, alteration of the abutments and replacement with a deck providing sufficient clearance.
4. Bridge Removal – demolition of the existing bridge and diversion of footpath.

6.2.3 A summary of the optioneering process is summarised in Table 6-1:

Table 6-1 Optioneering for Springbank Lane Footbridge (MVL3/8)

Option	Key Constraints	Advantages	Disadvantages	Preferred
1) Track Lower	• Sufficient clearance needs to be achieved to enable electrification of the line and allow freight gauge clearance. • Time required working within the railway corridor is required to be minimised as far as possible to reduce risk to construction staff and the length of line possession (closure of the railway) and resulting disruption to railway service. • The bridge spans a railway cutting and is accessible from the highway network only via a narrow footpath flanked by stone walls. This constrains the accessibility of the site to construction vehicles and the delivery of materials / components. • Ground investigation has revealed the shallow foundation depth of the bridge. There is currently no functional track drainage at this location. • The designation of the bridge as a grade II listed structure places a requirement on Network Rail to have special regard for its preservation under the Planning (Listed Buildings & Conservation Areas) Act 1990.	• Lowering of the track would enable retention of the listed bridge with raising of the parapets undertaken to prevent access to OLE. • Achieves clearance under Springbank Lane Footbridge (MVL3/8) and Springbank Lane Overbridge (MVL3/9) without the need for reconstruction	• Taking into account track lowering for MVL3/9 and to achieve the required clearance, the track would have to be lowered by varying depth for a distance of 500 m. The maximum depth would be c.342 mm on the Huddersfield Down line. Due to the shallow depth of rock at this location, this is a substantial engineering operation. • Requirement to improve drainage and consider how this water is discharged • Alteration of the retaining walls required to facilitate the new, lowered track position. Consideration to be given to the relationship between retaining wall configuration and listed building.	**Y**
2) Bridge Jacking		• Disruption of railway minimised due to short duration of jacking operation. • This option would enable the retention of the listed bridge. The abutments, deck and parapet would be retained, although in altered form.	• Bridge jacking for masonry arch bridges is a relatively untested methodology, having been delivered on very few historic structures to date. The feasibility jacking masonry arch structures relies on optimal site conditions, where a high level of control can be achieved and long timescales allowed for implementation. The long-term viability of this option is currently unknown. • The location of the bridge over a cutting with limited access has significant limitations for execution of a bridge jacking operation. • Jacking of this bridge would not be viable as the structural beams are cast iron which is very brittle, therefore would likely be damaged during the jacking. • Jacking of the bridge would raise the level of the footpath across the bridge, and require a greater increase to parapet height across the structure. • Option would require consideration given to the design of altered junctions between deck and abutment/parapets which would impact appearance of retained structure	N
3) Bridge Reconstruction		• Reconstruction of the bridge would enable the preservation of elements of the historic structure, through the retention and reuse of the bridge abutments in conjunction with the new bridge deck. • Reconstruction of the bridge can be delivered substantially from track level. This would minimise the need for construction access by road at this constrained site. • The installation of a preconstructed deck would minimise railway possession time and disruption to the railway network.	• Reconstruction of the bridge would result in the loss of the bridge deck and a portion of the parapets and abutments. This would result in the removal of a significant proportion of the historic bridge, substantially altering its form and appearance, and negatively impacting the integrity and significance of the structure.	N
4) Bridge Removal		• Removal of the bridge would minimise disruption to the railway network and provide a cost effective solution.	• This option would result in substantial harm to the listed building due to the complete removal of the structure • Removal of the bridge would permanently remove footpath access across the railway in this location, requiring consideration given to its re-routing	N

6.2.4 The preferred option of track lowering and increasing parapet height (option 1) was determined in early discussions on the overbridge. This option was deemed to be deliverable in terms of cost and constructability and would have minimal impact on the significance of the grade II overbridge. Given that this is achievable for Springbank Lane Footbridge (MVL3/8), this option was progressed to detailed design and the other options 2 to 4 presented in Table 4 1 were not investigated further.

6.3 Preferred option design development – Option 1 Track Lower

6.3.1 Design development was subsequently undertaken to mitigate the potential impact of the electrification of the line on the heritage significance of the structure as far as reasonably practicable and develop a sensitive design solution which would ensure the structure complies with Network Rail safety standards for bridges over electrified railway lines.

Track Lower

6.3.2 To facilitate the track lower between Springbank Lane Footbridge (MVL3/8) and Springbank Lane Overbridge (MVL3/9) it is necessary to construct a retaining wall between the structures. The proposed design comprises the installation of piles (king posts) with boards spanning between these to retain the embankment. To minimise the potential for damage to the listed structure, attachment of this C-section structural steel component to the bridge would allow the piles to be offset from the listed building. This would avoid the need for piling in close proximity to the structure, yet still allow the retaining wall to extend right up to each of the listed bridges performing the required structural function. The PFC would be attached to the east abutment on the north elevation by bolts extending a minimum of 200mm into the structure. This minor and largely reversible intervention was considered to be preferable to the alternative of piling immediately adjacent to the listed building to facilitate the track lower, and ultimately the retention of Springbank Lane Footbridge (MVL3/8) over the electrified railway.

Electrical Protection Works

6.3.3 A key factor considered throughout the design process is the required compliance with health, safety and security standards. The existing flat form of the copers to the footbridge presents a security risk due to the potential for sitting or walking along them. It is therefore necessary to replace these with anti-sitting steeple copers to prevent access along the top of the bridge parapet. This proposed alteration in turn triggers the need to comply with Network Rail safety standards for bridges crossing an electrified railway which require a

minimum clearance to be achieved to reduce the risk of members of the public coming into contact with live electrical equipment. Where these minimum clearances are not achieved, as is the case at Springbank Lane Footbridge (MVL3/8), a minimum parapet height must instead be achieved.

6.3.4 The current height of the parapets at Springbank Lane Footbridge (MVL3/8) falls below the minimum height requirement as set out in NR/L3/CIV/020. This Network Rail Standard has its basis in ensuring safety on the railway delivering adequate protection for users and the public in line with Health and Safety legislation and Building Regulations. The minimum parapet height required for bridges over an electrified line is generally 1.5 m; however, justification must be provided that a height of 1.8 m cannot be achieved whilst taking into account the risk profile of the bridge.

6.3.5 The risk assessment undertaken for Springbank Lane Footbridge (MVL3/8) identified the footbridge to be of 'low risk' with respect to security and contact with the public. Based on this assessment and in recognition of the need to retain the significance of the listed structure as far as possible, it has been determined that the minimum parapet height required for the structure is 1.55 m, allowing 50 mm tolerance for future resurfacing of the bridge deck.

6.3.6 To meet this requirement it was identified that the existing 235 mm copers be removed and replaced with 382 mm high steeple copers. The proposed replacement copers would satisfy the minimum required parapet height requirement and ensure the shape of coping stone complies with Network Rail standards. The proposed height of the altered parapets would exceed the minimum required height of 1.55 m; however, limiting the parapet raise to minimum permissible height while introducing a compliant coping stone shape would require intervention into the fabric of the parapets below the copers, thus resulting in greater impact to the historic fabric of the bridge.

6.3.7 Optioneering was undertaken to determine the type of material to be used for the parapet raising. Three options were considered to try to limit changes to the structure's historic fabric and impacts on its architectural interest. The options considered are summarised below in Table 6-2

Table 6-2 Parapet Extension Material

Option	Advantages	Disadvantages	Indicative image	Preferred
Option 1 – Natural Stone	• Natural stone would be sympathetic to the historic character of Springbank Lane Footbridge (MVL3/8), in keeping with its architectural interest. • Natural stone copers would represent an honest intervention, with the form of the stones readable as a response to the electrification challenge, while sympathetically integrating with the existing and historic character of the bridge. • Over time, this material would weather to further integrate with the existing masonry elements Springbank Lane Footbridge (MVL3/8).	• This option is determined to be the most expensive of the three options due to costs for quarrying and fees for masonry contractors. • Natural stone is heavier than the other two options, resulting in increased loading of historic parapets and bridge structure. • The weight of natural stone also requires special consideration be given to manual handling safety protocols.		**Y**
Option 2 – Coloured Concrete	• Lighter material than natural stone, reducing loading on the retained parapets and structure. • Concrete can be coloured to achieve a close visual match to the adjacent masonry coping stones. • This material would weather over time, increasing the similarity in appearance between coloured concrete and the existing masonry. • Coloured concrete copers would be relatively cost effective, reducing the cost of this publicly funded project.	• Introduction of different modern material into listed structure. While relatively sympathetic this material would risk negatively impacting on the architectural interest of the Springbank Lane Footbridge (MVL3/8)		N
Option 3 – Glass Reinforced Plastic (GRP)	• Lighter material than natural stone, reducing loading on bridge and parapets • Cost effective material, reducing the cost of this publicly funded project	• There would be a stark visual disparity between the GRP copers and historic fabric, detracting from the architectural interest of Springbank Lane Footbridge (MVL3/8) • GRP copers would not weather or soften in the way natural stone or concrete would, with the difference in material continuing to detract from the character of the historic bridge. • Of the options considered, GRP copers would result in the highest level of harm to the character of the bridge		N

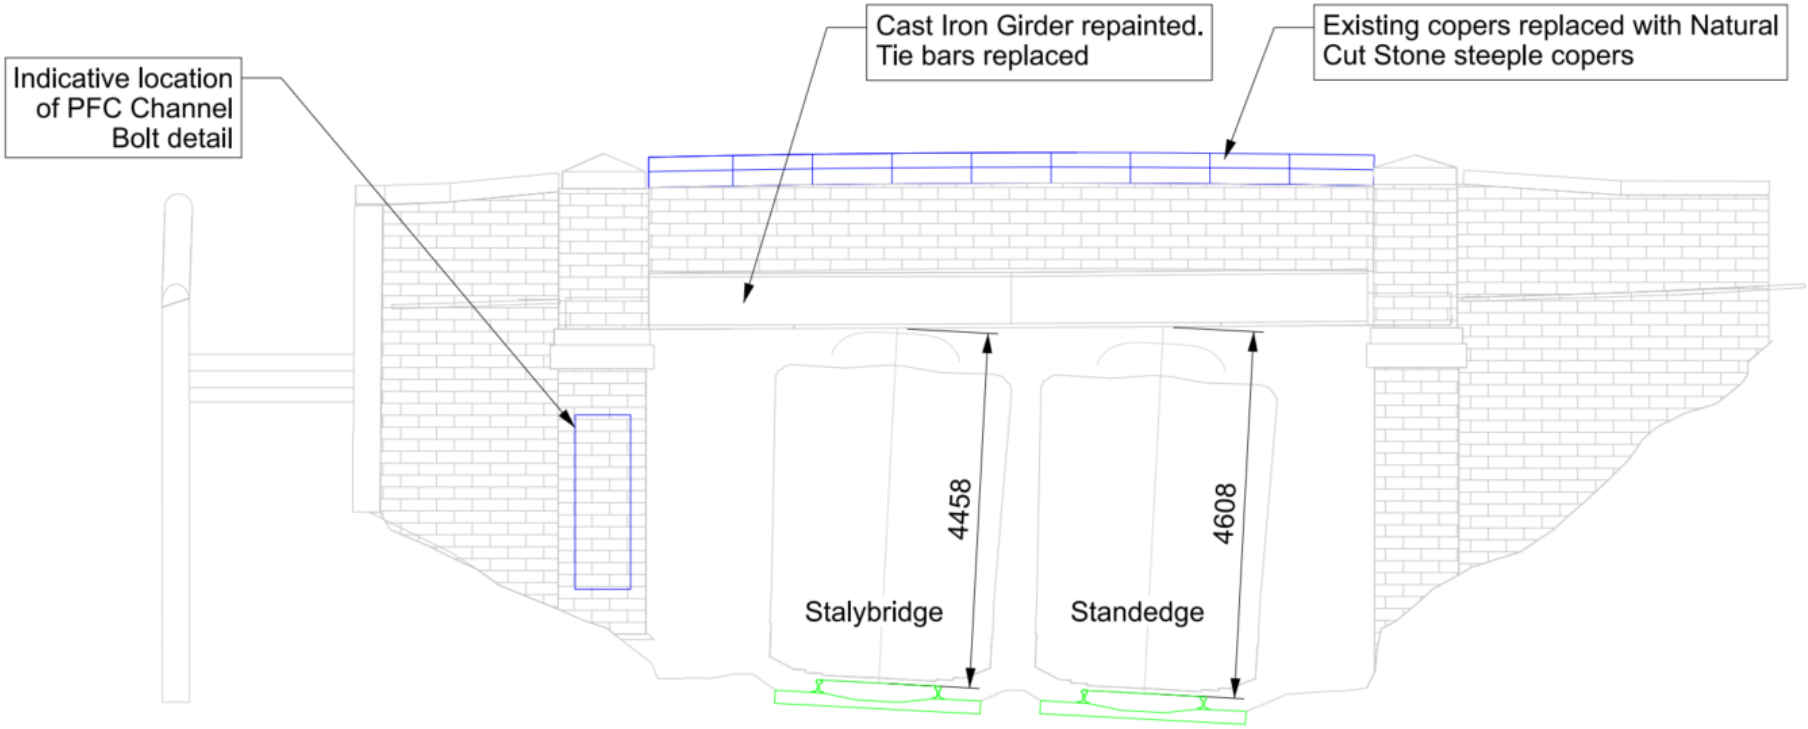
6.3.8 Structural assessment of the existing bridge and parapets established that the footbridge can accommodate the additional weight of natural stone steeple copers without any requirement for strengthening the existing structure. Taking the factors outlined in Table 6-2 into account, it was decided that Option 1 (natural stone) would be progressed as the preferred option as it would minimise the adverse impact the works would have on the historic character and significance of Springbank Lane Footbridge (MVL3/8).

6.4 Description of proposals

6.4.1 The proposed track lowering at this location would enable the retention of Springbank Lane Footbridge (MVL3/8) in a largely unaltered state. Works are nevertheless required to the bridge to facilitate the electrification of the railway in a manner that complies with the required safety standard for a structure over an electrified line (Insert 6-2).

6.4.2 The works to the listed bridge would comprise:

- Replacement of the existing flat coping stones between the bridge piers with natural stone steeple copers which achieve the minimum parapet height and required sloped profile;
- Repointing the parapets and jack arches;
- Replacement of the jack arch tie bars;
- Grit blasting and repainting of the cast iron girders;
- Installation of bonding lugs;
- Installation of two electrification warning signs per parapet;
- Installation of flashover strips; and
- Installation of PFC on the east abutment on the north elevation of the bridge.



Insert 6-2 - Proposed north elevation of Springbank Lane Footbridge (MVL3/8)

Construction Methodology

6.4.3 The proposed works to Springbank Lane Footbridge (MVL3/8) would comprise:

- Removal of the existing copers using track machinery between the bridge piers;
- Installation of nine new natural stone steeple copers per parapet, which would each be c. 1m in length, to be fixed to the parapet using stainless steel dowels.. The process for installation of copers comprises:
    - Drill holes into existing parapets;
    - Land steeple copers with cast-in dowels from the track using lifting straps and lower into the dowel holes and onto shims; and
    - Flood grout between the steeple copers including the dowel holes.
- Removal of existing pointing and application of new pointing using hand tools using lime-based mortar for repairs to transverse jack arch and parapets.
- Installation of five replacement jack arch tie bars, as per the NR standard detail (NR-CIV-SD-2800-B and 2801-B).
- Clean using grit-blasting and then repaint existing cast iron beams.
- Installation of a bonding lug on each of the cast iron girders.
- Installation of PFC with fixings embedded at least 200mm into masonry.

6.4.4 The proposed works to Springbank Lane Footbridge (MVL3/8) are shown in the following drawings which accompany this application:

- Existing and Proposed Plan (167037-TGP-22-MVL3-DRG-T-LP-160802); and
- Existing and Proposed Elevation and Section (167037-TGP-22-MVL3-DRG-T-LP-160803).

7. IMPACT OF PROPOSALS

7.1 Springbank Lane Footbridge (MVL3/8)

7.1.1 The proposed works to the grade II listed Springbank Lane Footbridge (MVL3/8) are required in order to accommodate OLE infrastructure as part of the wider TRU programme. These works would result in minor alteration of the structure comprising addition of natural stone steeple copers, replacement of tie bars, installation of a PFC, and minor repairs.

7.1.2 The proposed works have been designed in manner sympathetic to the historic character of Springbank Lane Footbridge (MVL3/8). Great weight has been given to preserving the structure's architectural interest, while also achieving a design which is deliverable and conforms with the safety requirements of an electrified railway.

7.1.3 The proposed works would result in the removal of the existing flat stone copers, and drilling of holes into the brick parapets for installation of the new copers with grouted steel dowels. This would result in some limited loss of historic fabric. However the existing copers were a later addition rather than part of the original A.S. Jee design, having been installed during the reconstruction of the bridge in the later 19th century. The addition of new natural stone steeple copers would constitute a permanent change to the structure. Following the installation of the copers, the steel dowels would be concealed from view.

7.1.4 The installation of steeple copers would alter the appearance of the bridge, slightly increasing the parapet and altering their form. The extent of this change in height has been limited as far as possible through a risk-assessment based approach. The new copers have been designed to match the existing in terms of colour and form to minimise visual changes and would be legible as a modern alteration of the structure. The proposed use of natural stone is sympathetic to the character of the bridge, matching the materiality of the existing flat copers as well as the original 1840s abutments. This material would weather over time to better integrate visually with the historic structure.

7.1.5 The installation of the PFC on the north elevation of the bridge would represent a minor alteration to the appearance of the structure, with an associated limited disturbance of historic fabric arising from the fixings required to facilitate attachment. This proposed permanent addition to the structure is considered preferable to the alternative of piling in close proximity to the bridge and would facilitate the lowering

of the railway track allowing the retention of Springbank Lane Footbridge (MVL3/8) over the electrified line.

7.1.6 Whilst resulting in minor alteration and intervention into historic fabric of Springbank Lane Footbridge (MVL3/8), these works would have a limited impact on the overall significance of the structure. The form of the bridge's cast-iron deck and brick jack arch would be maintained, as would architectural features such as the quarry-faced stone abutments, ashlar stone band topped plinths and the quality of detailing and construction, which are key aspects of the asset's significance.

7.1.7 The group value of the structure with other bridges designed by A.S. Jee for the Huddersfield & Manchester Railway would be maintained. The proposed works would affect fabric of late 19th century date and would not impact Jee's original construction. The connection to the other Jee structures would continue to be understood, maintaining the bridge's group value with other Jee-designed bridges along the Transpennine route. The minor raising of the parapet height and adding of natural stone steeple copers would be understood as a sensitive alteration as this is only a slight visual variation from the previous flat stone copers. Further, this change is required to enable modernisation of the railway line through its electrification, and part of the ongoing use and modernisation of the historic railway network.

7.1.8 Repointing of the parapets and jack arch would improve the condition of the structure, maintaining its historic fabric and ensuring preservation of its significance. The grit-blasting and painting of the bridge deck and installation of bonding lugs to the cast-iron beams would also serve to improve its condition and longevity.

7.1.9 These proposals would therefore result in a very low level of less than substantial harm to the significance of Springbank Lane Footbridge (MVL3/8), as stated by Historic England in their letter of 17 September 2024.

7.2 Other heritage assets

7.2.1 Due to the distance from the surrounding heritage assets and the low visual impact of the proposals, the proposals would not result in any impact to any surrounding designated or non-designated heritage assets

7.3 Mitigation

7.3.1 The design proposals have been developed to minimise impacts on the fabric, form and appearance of Springbank Lane Footbridge (MVL3/8). This has been achieved through a robust process of optioneering, undertaken in in consultation with Historic England and TMBC. Measures incorporated into the design to mitigate impacts on the significance of the bridge include:

- Use of natural stone steeple copers to best match existing historic fabric, to minimise visual impact upon historic significance and look more in keeping with its original architectural style. Natural stone copers would weather over time and aid their integration with the historic bridge masonry still evident in the abutments, deck and pilasters.
- Inclusion of steeple copers allows for the raise in parapet height to exceed the safety minimum of 1.55m without requiring significant intrusion into fabric below copers.
- Lowering the track rather than reconstruction, jacking or removal minimises impact on the fabric of the bridge while allowing for safe clearance under the footbridge.

7.3.2 During construction of the works, toolbox talks to disseminate best practice for reducing potential impacts in relation to construction activity associated with Springbank Lane Footbridge (MVL3/8), would also be delivered, for example to help avoid accidental damage.

Recommended Compensation

7.3.3 In addition to these embedded measures, additional mitigation secured through the use of listed building consent conditions is recommended comprising:

- A scheme of historic building recording to Level 1 standards in accordance with Historic England guidance (Historic England 2017c). This would provide a permanent record of Springbank Lane Footbridge (MVL3/8) in its current form and be lodged with the Greater Manchester Historic Environment Record.
- A scheme of permanent heritage interpretation would be developed and installed adjacent to Greenfield Station. This would provide the opportunity to engage members of the public with the heritage of the Huddersfield & Manchester Railway including the historic structures designed by A. S. Jee, such as Springbank Lane Footbridge (MVL3/8). Further engagement with stakeholders with respect to the content of the

interpretation would be undertaken during the detailed design phase.

7.4 Public benefit

7.4.1 The works proposed to be undertaken to Springbank Lane Footbridge (MVL3/8) are required to ensure the realisation of the substantial public benefits of the Order Scheme.

7.4.2 As part of the wider TRU Programme, the Order Scheme would directly and indirectly play a role in improving regional connectivity and enhancing of some of Britain's busiest rail network, in turn realising economic, social and environmental objectives of the programme. The Transpennine route is identified as a key transport corridor, providing connections between cities in the North of England. The improvements in connectivity delivered by the TRU programme will support aspirations for economic growth and "levelling up" opportunities across the North of England.

7.4.3 The key objectives of the TRU programme are to achieve the part electrification of the Transpennine Route, improve journey times and capacity between key destinations, improve overall reliability and resilience of the route, and provide environmental benefits from modal shift from road to rail freight reducing the number of heavy vehicles on the highway network and associated air pollution. The completion of the proposed works at Springbank Lane Footbridge (MVL3/8) would contribute towards this, ensuring compliance with Network Rail safety standards to allow electrification under the footbridge, thereby delivering increases in line speed, capacity and resilience.

7.4.4 Electrification would deliver faster journey times and improved performance by allowing trains to accelerate faster, and brake more efficiently. The Order Scheme will deliver faster line speeds (80 mph throughout), improving journey times along the Transpennine Route, aiming to provide an improved journey time from Leeds – Manchester Victoria of 42-44 minutes and York to Manchester Victoria of 65-67 minutes. Works to the track and structures along the Route, including Springbank Lane Footbridge (MVL3/8), are required to accommodate this increase, and without these changes the Scheme would be unable to go ahead.

7.4.5 As a vital constituent part of the Order Scheme, the proposed works at Springbank Lane Footbridge (MVL3/8) would also facilitate indirect benefits associated with the wider programme of works, including station upgrades, track renewal and signalling improvements.

7.4.6 The reliability and resilience of the route and services operating on it will be improved by replacement of existing infrastructure with electrification equipment, new track drainage and signalling. Modern signalling equipment will reduce the headway between trains, allowing them to run closer together which will in turn provide increased capacity. The Scheme will provide the capability to operate four 'express', two 'semi-express' services and up to two local services an hour on the Route and will provide increased flexibility to timetable more train paths.

7.4.7 Electrification of the Scheme would provide substantial environmental and sustainability benefits through the introduction of more environmentally viable energy solutions and is an investment in 'greener' energy technology. This supports Network Rail's Decarbonisation Strategy and is bolstering national targets for reducing harmful emissions that cause climate change, which are set out in Government legislation for achieving net zero carbon by 2050.

7.4.8 The Order Scheme will also deliver improved safety through measures including replacement of two level crossings, installation of additional safety measures on existing bridges; enhancements to the local highway networks and new pedestrian crossing points at locations including Greenfield and Mossley Stations. Accessibility of the railway network will also be improved with the provision of fully accessible stations at Greenfield Station and the relocated Mossley Station. These measures are being brought forward as part of the wider TRU Scheme to electrify and modernise the Route, as facilitated, in part, by the works to Springbank Lane Footbridge (MVL3/8).

7.4.9 Significant residual beneficial effects arising from the operation of the wider TRU Scheme have been previously identified in the Huddersfield-Westtown TWA Order Inquiry from December 2021. These included recognition of improved journey times, reliability, and capacity at the Local Authority area and in turn the sub-regional and regional level. These improvements will bring direct significant benefits to local businesses and the labour market through improved access to the local regions along the section of the route from Stalybridge to Diggle.

7.4.10 To this effect, the proposals at Springbank Lane Footbridge (MVL3/8) are therefore essential in achieving the overall substantial public benefits of Route Section W2B and wider objectives of the Order Scheme, and without these interventions, the Order Scheme would not be able to be safely and successfully implemented. Alongside these substantial public benefits, the delivery of heritage interpretation adjacent to Greenfield Station would enable public

engagement with the heritage of the Huddersfield & Manchester Railway, its architecture and significance.

8. CONCLUSION

8.1.1 The significance of Springbank Lane Footbridge (MVL3/8) lies primarily in its historic and architectural interest. The bridge is an altered example of an footbridge dating to the Heroic Age (1841-1850) of railway building, with later alterations likely from the late 19th century including the inclusion of blue engineering brick parapets. The high quality of the bridge's architecture, including impost bands, pyramidal-capped pillars, and large circular gateposts, together with the quality workmanship of the construction is characteristic of A.S. Jee's work for the Huddersfield & Manchester Railway. The bridge derives significance from this direct historic relationship with notable railway engineer A.S. Jee and the historic railway companies namely the Huddersfield & Manchester Railway and LNWR. The setting of Springbank Lane Footbridge (MVL3/8) makes a minor contribution to the significance of the structure. It also possesses group value as one of a number of A.S. Jee structures on the Transpennine route which share a common design language.

8.1.2 The proposals for alteration of Springbank Lane Footbridge (MVL3/8) have been developed through a robust optioneering process, undertaken in consultation with Historic England and TMBC, and designed to minimise impact on the significance of the listed building as far as possible. The proposed works would comprise:

- Replacement of the existing flat coping stones with natural stone steeple copers;
- Repointing the parapets and jack arches;
- Replacement of the jack arch tie bars;
- Grit blasting and repainting of the cast iron girders;
- Installation of bonding lugs;
- Installation of warning signs to the parapets;
- Flashover strips anchored into the jack arches and parapets over the track central line; and
- Installation of PFC to north elevation of the bridge.

8.1.3 The proposals would result in a low level of less than substantial harm to the significance of Springbank Lane Footbridge (MVL3/8), as defined under the paragraph 214 of the NPPF. These impacts are necessary in order to deliver the TRU, and would support the achievement of public benefits related to:

- Improved efficiency and reliability of the railway (in journey time saving and increased capacity);
- Reduction of delays to trains and other highway users (improved efficiency of the railways means fewer heavy vehicles on the highway network causing traffic issues and contributing to air pollution);
- Supporting sustainable transport development in line with Network Rail's Decarbonisation Strategy; and
- Improving public health and safety in providing safe routes across the railway.

8.1.4 In addition to this, the delivery of a programme of heritage interpretation at Greenfield Station would provide the opportunity for engagement of the public with the heritage of the Huddersfield & Manchester Railway.

8.1.5 These substantial public benefits would outweigh the less than substantial harm to the significance of Springbank Lane Footbridge (MVL3/8) as defined in paragraph 215 of NPPF. The proposals would also satisfy the requirements of Policy C5 of the Tameside Unitary Development Plan in relation to the impact on the character of the listed building, and preservation of its architectural style and features. They would also fulfil the requirements of policy JP-P2 of Places for Everyone in relation to responding to the significance of heritage assets and sense of place, and delivering benefits to the historic environment, economic viability, accessibility and environmental quality. The proposals therefore satisfy both national and local policy requirements in relation to the justification for harm to the significance of Springbank Lane Footbridge (MVL3/8).

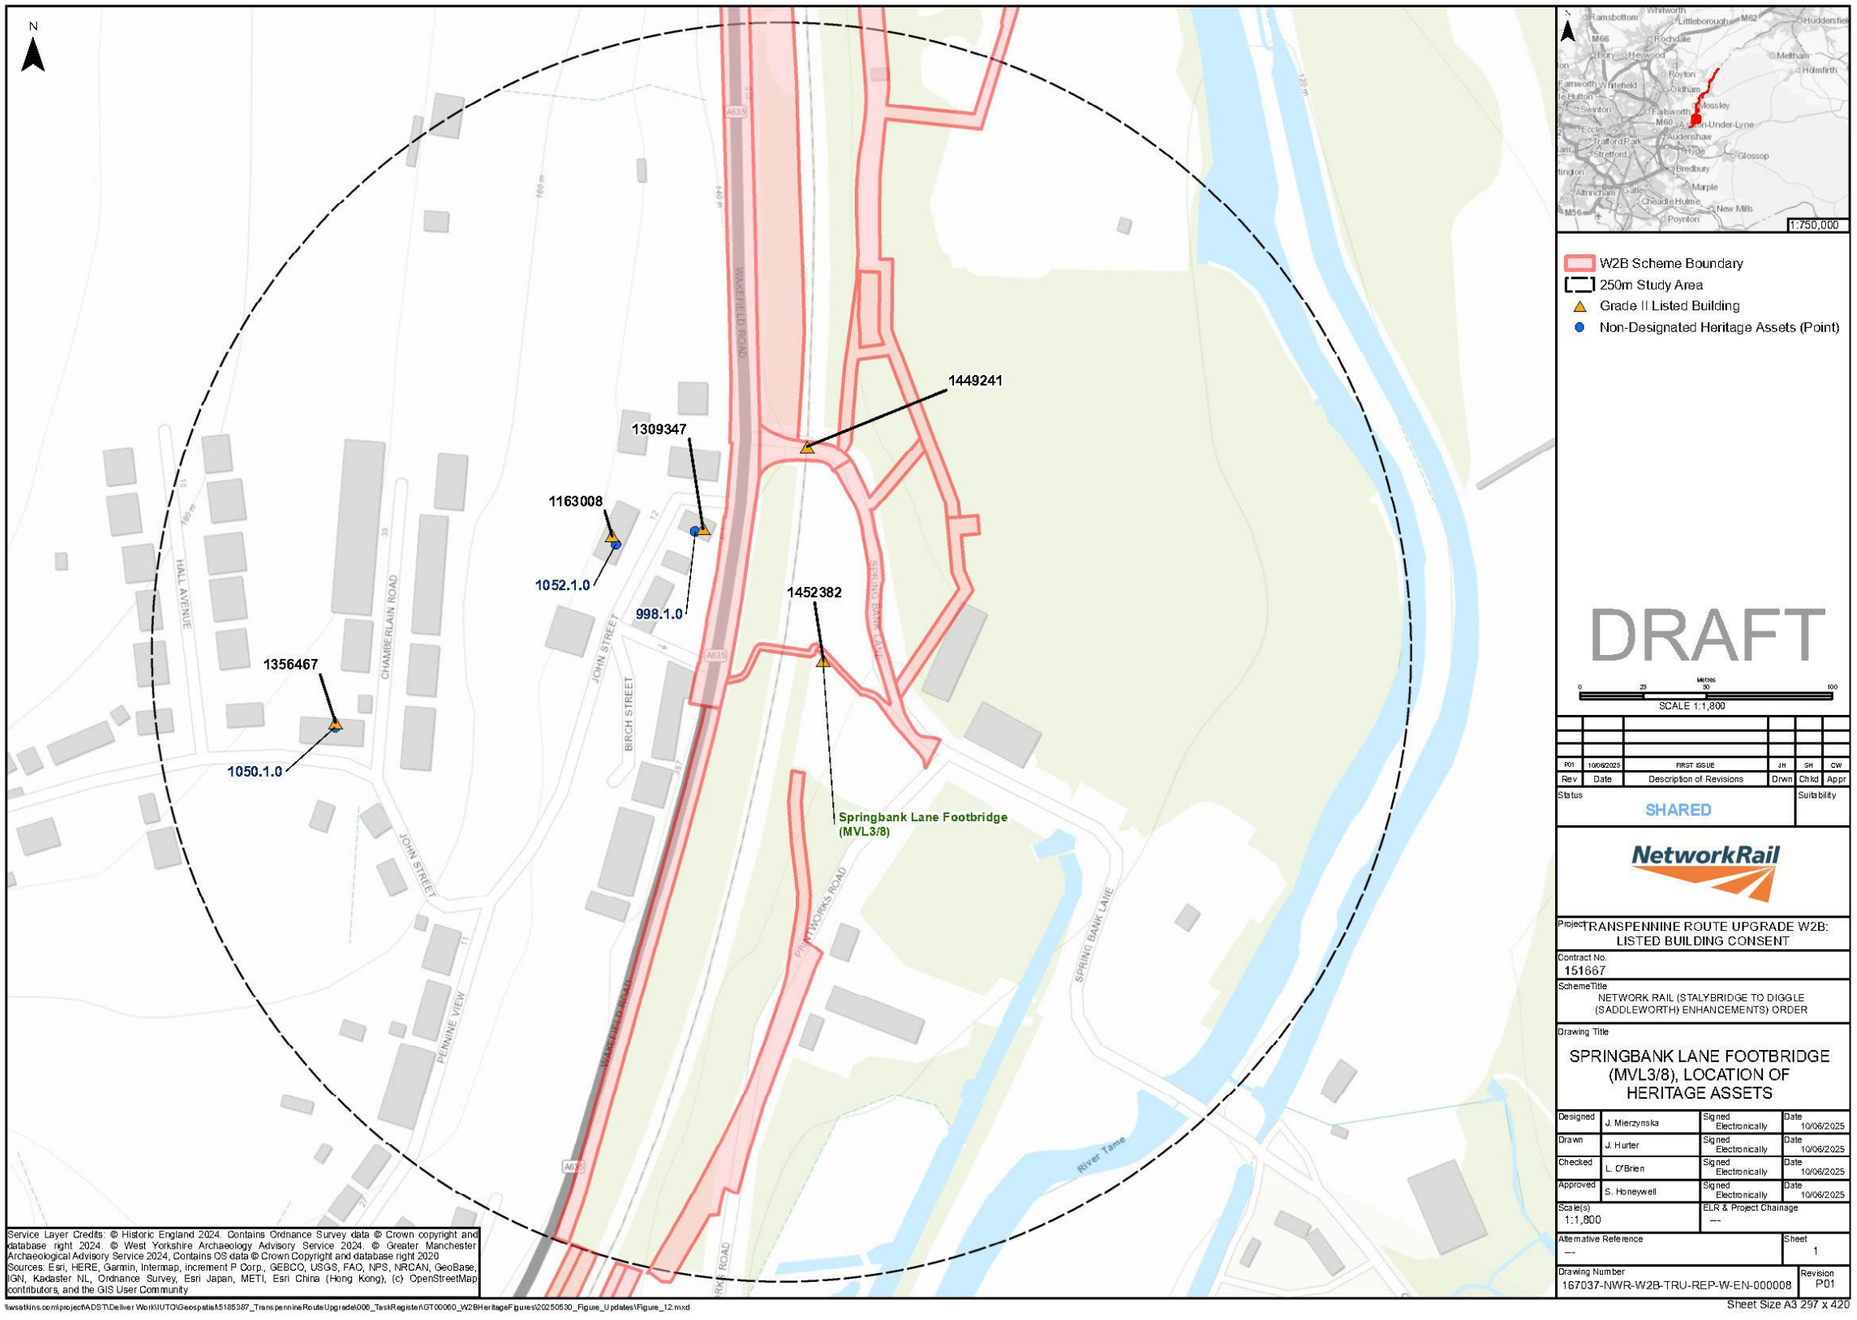
APPENDIX A – LOCATION PLAN



APPENDIX B – NATIONAL HERITAGE LIST DESCRIPTION

Official list entry

Heritage Category:	Listed Building
Grade:	II
List Entry Number:	1452382
Date first listed:	23-Mar-2018
List Entry Name:	Railway overbridge MVL3/8, Springbank Lane Footbridge
Location Description:	Footpath between A635 Wakefield Road and Spring Bank Lane, Heyrod.

Location

The building or site itself may lie within the boundary of more than one authority.

District:	Tameside (Metropolitan Authority)
Parish:	Non Civil Parish
National Grid Reference:	SD9733200110

Summary

Railway overbridge and flight of steps, 1845-1849, with later parapets, by AS Jee for the Huddersfield and Manchester Railway.

Reasons for Designation

Springbank Lane Footbridge (MVL3/8), constructed in the mid-late 1840s by AS Jee for the Huddersfield and Manchester Railway and with later parapet alterations, is listed at Grade II for the following principal reasons:

Historic interest:

* constructed during the heroic age of railway building and a relatively little-altered example (retaining cast-iron edge beams) of an 1840s overbridge on what is now one of the main railway lines in northern England;

* designed by the notable railway engineer Alfred Stanistreet Jee.

Architectural interest:

* the bridge is well-detailed with impost bands, a parapet incorporating pyramidal-capped pillars, and large circular gateposts leading to a well-constructed stepped footpath, that lift its design above the purely functional.

Group value:

* with the other listed structures designed by Jee on the Huddersfield and Manchester Railway line, in particular Heyrod Bridge (National Heritage List for England 1449241).

History

In contrast to the main trunk lines of the late 1830s that were constructed by single railway companies the route from Stalybridge to Leeds had fragmented origins and was the work of three different railway companies: the Huddersfield & Manchester Railway, Leeds, Dewsbury & Manchester Railway, and the Manchester & Leeds Railway.

The Huddersfield & Manchester Railway was authorised in 1845 and followed the route of the Huddersfield Narrow Canal for much of its length, including a railway tunnel through the Pennine hills set alongside the earlier Standedge Canal Company tunnel of 1811; in 1846 the railway company also acquired the canal. Joseph Locke and Alfred Stanistreet Jee were appointed to survey and design the new line, the two engineers having already worked together on a major project linking Manchester and Sheffield. Jee became the lead engineer for the Huddersfield line, which passed through challenging terrain, assisted by resident engineers that included his brother Moreland Jee (until 1848) and Herbert F Mackworth. Construction of the line was divided into various contracts, with many contractors being only responsible for a single cutting, viaduct or tunnel portal. The largest contract for the Standedge Tunnel between Diggle and Marsden was let to a single contractor, Thomas Nicholson in 1847. The tunnel's completion in 1849 marked the opening of the line.

The Leeds end of the route, which was also authorised in 1845, was constructed by the Leeds, Dewsbury & Manchester Railway. The engineer was Thomas Grainger who had previously largely worked in Scotland, and the line was completed in 1849.

A short three-mile section of the route between Heaton Lodge Junction and Thornhill Junction near Mirfield was developed by the Manchester & Leeds Railway and was constructed between 1837 and 1840, with George Stephenson as the chief engineer. The structures on this line were designed by Thomas Gooch under the oversight of Stephenson. In 1847 the railway company changed its name to the Lancashire & Yorkshire Railway.

In 1847 the Huddersfield & Manchester Railway and the Leeds, Dewsbury & Manchester Railway were acquired by the London & North Western Railway (LNWR) so that the company could access the city of Leeds and the textile towns of West Yorkshire. This pitted them as rivals to the Lancashire & Yorkshire Railway, although at points on the route the two

companies had to work together. By 1851 the London & North Western Railway had an overall mileage of railway track of 800 miles and it became the most prominent railway company in the country and the largest joint-stock concern in the world in the late C19. Although the LNWR had a general manager, Captain Mark Huish, the lines of the Stalybridge to Leeds route still managed their own affairs. LNWR later carried out expansion works, including the widening of tracks and bridges, the construction of additional tunnels, and station alterations. In 1923 the line became part of the London Midland & Scottish Railway, and subsequently part of the nationalised British Railways in 1948. The line, its structures and track are currently (2018) owned by Network Rail, and the passenger services operated by TransPennine Express and Northern Rail.

This overbridge was built to carry the footpath between Spring Bank Lane and Wakefield Road over the railway. It was designed by AS Jee (1816-1858) and dates from the line's construction between 1845 and 1849. The upper courses of the parapets appear to be of a different brick from the lower six courses and all are probably a later addition, probably replacing an iron parapet or balustrade. The deck has been overlaid with tarmac. Otherwise the bridge appears little-altered.

Details

Railway overbridge and flight of steps, 1845-1849, by AS Jee for the Huddersfield and Manchester Railway, with late-C19 and C20 parapet alterations.

MATERIALS: sandstone, cast iron, red brick, blue engineering brick.

DESCRIPTION: the bridge carries a footpath running east-west over the railway, with steps on the eastern side down to a path running south-east towards Spring Bank Lane.

The single span has a deck formed by cast-iron edge beams with a brick jack arch spanning between the bottom flanges. The abutments are battered, of squared and coursed quarry-faced stone with a weathered plinth and surmounted by an ashlar band. Projecting piers at all four inner corners are quoined, with a flush return linking them beneath the span. The piers have parapet imposts of three weathered ashlar steps, and pyramidal caps. The approach walls are of random-coursed squared stone with punched hog's-back copings and a weathered projecting band at the base. The parapets are of blue engineering brick laid in alternate header and stretcher courses, the bottom six courses apparently older than those above. The stone parapet copings are twice-weathered. The deck is surfaced with tarmac.

On the eastern side steep steps run down to the north between the approach walls to a landing enclosed by a curving northern wall, with monumental posts at the eastern corners. The posts are circular with a weathered plinth, punch-dressed, and with a dome-topped deep circular cap to the southern post, that to the north being missing. The northern approach wall continues for two metres beyond the post alongside the footpath, stepping down to meet the ground. Mild steel handrails are fixed to the southern post and the inner faces of the approach walls.

SUBSIDIARY FEATURES: from the landing, four sandstone steps run down to the footpath, which is comprised of short landings of sandstone setts divided by flights of three shallow steps with setted treads and flagstone risers, all well-worn.

Our ref: PA01200823

25 June 2024

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the pre-application meetings over the last five months. These have been extremely useful in explaining the significance of the heritage assets, the design team's approach, and in exploring issues and constraints associated with electrifying the track.

This letter covers our advice regarding proposals for change to eight listed railway structures between Stalybridge and Standedge Tunnel, within the Metropolitan boroughs of Tameside and Oldham in Greater Manchester. This section of the railway is referenced as W2B.

Significance

The section of railway between Stalybridge and Standedge Tunnel was constructed in stages between 1844 and 1849. This was at the height of “railway mania”; an intense period of activity when many competing companies formed and were racing to complete sections of railway. The Stalybridge and Standedge Tunnel railway eventually became part of a wider network of sections of track that extends from Selby and York to Manchester Victoria via Leeds.

The W2B route has considerable heritage value. It traverses areas of dramatic landscape and varied geology, and has remained well preserved and largely unaltered since its opening in the 1840s. The wider railway network from the Yorkshire cities to Manchester contributed hugely to the economic and urban development of the North and was a major factor in the industrial revolution and in the development of towns.

Historic England

The tricky geology and terrain of the W2B route presented challenges to the engineers of the 1840s, and many of the most notable surviving features of the railway are the impressively engineered bridge and viaduct structures. These structures are predominantly built from locally sourced stone, meaning they harmonise with the landscape and contribute to local views, adding to the aesthetic value of the route. The significance of the structures also lies in the fact that they survive well and in large numbers. There have been few alterations to bridges, mainly because this section of the line has not been widened as other parts of the wider route have been.

There are eight listed railway structures that will be affected by the proposed electrification works between Stalybridge and Standedge Tunnel; these are:

- Heyrod Hall Overbridge - MVL3/7
- Heyrod Footbridge Overbridge - MVL3/8
- Spring Bank Lane Overbridge - MVL3/9
- Roughtown Road Overbridge - MVL3/17
- Wright's Mill Overbridge - MVL3/20
- Wright's Overbridge - MVL3/23
- Oldham Road Overbridge - MVL3/28
- Saddleworth Viaduct - MVL3/31

All eight of the listed structures were designed by notable railway engineer Alfred Stanistreet Jee, lead engineer for the railway between Huddersfield and Manchester. They were built in the mid-late 1840s and share many architectural characteristics, adding to their group value and enhancing their significance.

Bridges MVL3/7, MVL3/9, MVL3/17, MVL3/20, MVL3/23, and MVL3/28 are all very similar in design. All are made from coursed local sandstone and have segmental arches formed from tooled voussoirs, with larger keystones. Each has dressed ashlar impost bands, sloping string courses above the arch, and parapet copings, with shallow pyramidal caps to the slender piers. They have considerable group value and are easily identifiable in the landscape as bridges associated with the original construction of the railway. The bridges are all well designed and adapted to their individual locations, some being skewed or sloped. High quality workmanship and

SUITES 3.3 AND 3.4 CANADA HOUSE 3 CHEPSTOW STREET MANCHESTER M1 5FW

https://www.historicengland.org.uk/terms/privacy-cookies/

details such as picked and tooled ashlar voussoirs elevate their design above what is purely function, enhancing their significance further.

Heyrod Footbridge (MVL3/8) and Saddleworth Viaduct (MVL3/31) are clearly recognisable as part of the same scheme of work but differ in their form. Heyrod Footbridge features a flat span, and retains its cast-iron edge beams and brick parapets, while Saddleworth Viaduct comprises 23 sandstone arches spanning the River Tame and Huddersfield Narrow Canal.

The structures are all Grade II listed in recognition of their special architectural and historic interest at national level. Saddleworth Viaduct was listed in 1986, while all seven overbridges were listed in 2017 or 2018 after a comprehensive review of the line.

Impacts

The proposals involve demolition and reconstruction of three structures, total removal of one structure, and modifications to four structures. These works are deemed necessary to achieve the clearance required for the OLE (overhead line equipment) and to ensure safety for bridge users. The impacts of proposed works at each structure are discussed below.

Bridges requiring demolition works:

Heyrod Hall Overbridge MVL3/7 carries a short section of private road over the railway to Heyrod Hall. This bridge is in a rock cutting with very hard rock beneath the track, prohibiting track lowering.

Wright's Mill Overbridge MVL3/20 carries the public footpath and bridleway over the railway where it passes through a steep-sided rock cutting. Options to lower the track at this bridge have been investigated but discounted due to the location on the bridge in a rock cutting with very hard rock beneath. Track lowering would also have a knock-on effect to a nearby underbridge.

Oldham Road Overbridge MVL3/28 is a skew overbridge located on the north-east side of Greenfield Station and carries Oldham Road over the track below. There will be

Historic England is subject to both the Freedom of Information Act (2000) and Environmental Information Regulations (2004). Any information held by the organisation can be requested for release under this legislation.

Historic England

the addition of a new footbridge alongside the reconstructed road bridge. Options to lower the track at this bridge have been investigated but would be difficult to achieve due to the proximity to the station.

Proposals at these three bridges involves the complete dismantling of each bridge and reconstruction to create a raised, flat deck with sufficient clearance for OLE. Stone would be reclaimed and used to clad the inside faces of parapet walls; however matching stone is likely to be needed to clad the external sides of the parapets. New copers would also be needed to ensure parapets were the correct height.

The demolition and reconstruction of these bridges will cause substantial harm to their significance through the total loss of historic form and loss of much of their original fabric. The proposals will also diminish the group value of the historic bridges on the railway.

Wright's Overbridge MVL3/23 is a footbridge that carries a public footpath from north-west to south-east across the railway. The railway here is in a steep cutting and due to gradients, the bridge slopes down towards the south-east. Proposals involve the total removal of this bridge and diversion of the public right of way across the railway at another point.

The removal of Wright's Overbridge will cause substantial harm to its significance through the total loss of its historic form and all original fabric. Its removal will necessitate the re-routing of a historic public footpath, which is part of a network of paths in the area connecting mills and farms with workers' housing, and contributes to the landscape character of the area and to the setting of the bridge. The proposals will also further diminish the group value of the historic bridges on the railway.

Bridges requiring modifications:

Heyrod Footbridge Overbridge MVL3/8 carries a footpath running east-west over the railway, with steps on the eastern side down to a path running south-east towards Spring Bank Lane which are also listed.

Spring Bank Lane Overbridge MVL3/9 (also known as Heyrod Bridge) carries Spring Bank Lane over the railway. Due to the lie of the land the bridge slopes down towards the east. The splayed projecting wing walls are also covered by the listing.

Historic England is subject to both the Freedom of Information Act (2000) and Environmental Information Regulations (2004). Any information held by the organisation can be requested for release under this legislation.
We respect your privacy and the use of your information. Please read our full privacy policy for more information
https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

Roughtown Road Overbridge MVL3/17 carries Roughtown Road north-south across the railway, to the east of Mossley Station. Due to gradients the deck slopes down towards the south. The projecting wing walls are also covered by the listing.

Minimal interventions are proposed at these three bridges, the most significant changes being the introduction of new triangular copers to ensure the correct and safe parapet heights.

The introduction of triangular copers to raise the parapet heights to 1.5m will result in a low level of less than substantial harm to the significance of the bridges through the changes to their appearance and the loss of original copers. This harm could be further lowed by using stone copers instead of concrete, and by undertaking any other restoration works required such as replacing the recently rendered section of parapet copings in the south-west corner of Roughtown Road Bridge.

Saddleworth Viaduct MVL3/31 (also known as Uppermill Arches and Uppermill Viaduct) carries the railway over a series of roads and lanes, and the River Tame and Huddersfield Narrow Canal. Due to the lack of space available on the viaduct deck, proposals here involve attaching brackets to the exterior of the viaduct for the OLE supports.

The proposed works at Saddleworth Viaduct will result in a low level of less than substantial harm to the significance of the structure through the change to its appearance and in the physical impact on the elevations of the viaduct from the brackets. This harm could be further lowed by ensuring the spacing of the masts responds to the structural and architectural rhythm of the viaduct to lessen their visual impact.

Policy

National policy relating to the conservation and enhancement of the historic environment is articulated in section 16 of the National Planning Policy Framework (NPPF, 2023). These policies state that heritage assets are an irreplaceable resource and should be conserved in a manner appropriate to their significance, so they can be enjoyed for their contribution to the quality of life of existing and future generations (NPPF para 195). Also, when considering the impact of a proposed development, great weight should be given to an asset's conservation (NPPF para 205).

Historic England

Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification (NPPF 206).

Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss. In practice this means that less harmful alternative solutions should be explored through the pre-application and application processes.

In addition to section 16 of the NPPF, we refer you to Section 12 'Achieving well-designed and beautiful places' when considering the design for replacement bridge structures. Para 132 states that being sympathetic to local character and history is important, along with a consistent and high-quality standard of design (para 133).

Position

The proposed works to upgrade the W2B section of the Transpennine route network will be the first major programme of work since its construction in the 1840s. The wider public benefits of the upgrade work to this key transport network will be vast and will have positive knock-on effects across the region. The challenging geology and hydrology across the route still present issues to engineers today, and we welcome the work that has gone into investigating alternative options to demolition and reconstruction for the bridges affected.

The proposals will result in substantial harm to the significance of bridges MVL3/7, MVL3/20, MVL3/23, and MVL3/28, with the highest level of harm to bridge MVL3/23 which will be dismantled and not reconstructed. The proposals will cause harm through the loss of the form of the arched bridges and though the loss of historic fabric. There will be the additional harm to the group value of the bridges.

We agree that the bridges are predominantly experienced from the bridge deck, and that re-use of original fabric should be focussed on the inside faces of the parapet walls to ensure the look of the bridge when crossing it is not unacceptably altered, however this re-use of materials does not lower the harm to less than substantial levels. It will be for decision takers to weigh the balance of this substantial harm against the public benefits of the scheme.

Historic England

Works to bridges MVL3/8, MVL3/9 and MVL3/17 is largely limited to raising the parapets to ensure they are the safe and correct height. We acknowledge that Network Rail has a legal obligation to take reasonable steps to prevent people from coming into contact with the OLE by ensuring parapets cannot be climbed or walked on. We appreciate the work undertaken to investigate various options for different types of pantographs to limit the height at which the parapets need to be raised to. The use of triangular copers will introduce a change in the appearance of the bridges and cause a low level of less than substantial harm to their significance, but the impact can be lessened by use of stone rather than concrete copers which will be less visually obtrusive. Parapet design should be tailored to the individual circumstances of each bridge to ensure the least harmful solution is used.

There will also be a low level of less than substantial harm at Saddleworth Viaduct from the introduction of brackets to the structure to support the OLE. This can be further lowered by thoughtful spacing of the brackets.

We welcome the detailed options appraisals undertaken during the design of the proposed works to listed structures on the W2B route. We recommend that details are finalised using bespoke designs that respond to the particular character of each structure and its setting.

Next Steps

Thank you for involving us at the pre-application stage of this project. The above advice is the response that we would give if the same proposals were put forward unamended for statutory approval.

Yours sincerely

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the meeting on 27 August to review the proposals for bridges MVL3/7, 8, 17 and 20. It was useful to see the drawings in advance and then talk through the proposals with the team.

The significance of the affected structures has been set out in our letter of 25 June 2024 and won't be repeated here. The impacts of the proposed changes and our comments are detailed below:

MVL3/7 - Heyrod Hall Overbridge
The changes to this bridge involve demolition and reconstruction of the bridge deck and sections of the abutments, resulting in substantial harm to the significance of the bridge. The bridge is built from coursed local sandstone, and the voussoirs have been lightly tooled around the edges to give them definition and add interest to the arch. The proposed changes will result in the total loss of the historic form of this bridge and much of the original fabric.

In order to reduce harm, every care should be taken when demolishing the bridge so as much original undamaged stonework as possible can be retained for re-use. Where new stonework is needed, this should be as close a match as possible to the original stone, and courses should match up to minimise the visual impact of the works. We welcome the use of natural cut stone copers.

MVL3/8 - Heyrod/Springbank Lane Footbridge
The appearance of this bridge will change slightly through the introduction of new copers which will increase parapet height. The use of natural stone will help to minimise the appearance of the new copers and mean they were be less obvious. Overall, there will be a very low level of less than substantial harm to this bridge.

MVL3/17 - Roughtown Road Overbridge
This is another bridge where the proposals involve the introduction of new copers

SUITES 3.3 AND 3.4 CANADA HOUSE 3 CHEPSTOW STREET MANCHESTER M1 5FW

Historic England

which will increase parapet height. The changes here will be more noticeable than at MVL3/8 but still constitute a low level of less than substantial harm.

In order to minimise harm, it will be necessary to carefully design the ends of the new sections of coping stones to manage how they interact with the piers of the bridge. The piers are topped by shallow pyramidal caps, which currently form a prominent feature of the bridge's architecture. There is a danger that the definition of these caps will become lost if the new copers butt up to them. This mitigation could be achieved by either terminating the new copers short of the piers, or by raising the height of the pier caps so they remain prominent.

Additional mitigation should involve repairs to the fabric of the parapet walls, including removal of the cement kerb section and bollards, which will no longer be needed once the road is one-way.

MVL3/20 - Wright's Mill Overbridge
The proposals for demolition and reconstruction of this bridge will result in a substantially altered structure and substantial harm to the significance of the listed asset.

The historic form and materials of this bridge are very similar to MVL3/7, and the proposed construction works are also comparable, however the proposed parapet at MVL3/20 will be noticeably taller due to the bridge's use as a bridleway. The proposal drawings show the ends of the new copers sharply sloping down towards the piers of the bridge.

As advised with MVL3/17 above, care should be taken in the design and integration of these copers so they complement the existing structure and do not appear overly obvious. As with MVL3/7, we advise that every care should be taken when demolishing the bridge so as much original undamaged stonework as possible can be retained for re-use. Where new stonework is needed, this should be as close a match as possible to the original stone, and courses should match up to minimise the visual impact of the works.

Next Steps

I look forward to reviewing the next series of proposals for other parts of the scheme.

Yours sincerely

Louise Davies

Direct Dial: +447990339949

Our ref: PA01200823
18 July 2025

Dear Sarah

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the recent meetings to review the draft Heritage Statements that will be submitted for Listed Building Consent applications for changes to bridges on the proposed Transpennine Route Upgrade line.

The Heritage Statements are well considered and it is clear that alternative options to reconstruction have been investigated in each case, which are helpfully set out in tables in the reports. The proposals will result in substantial harm to listed bridges along the route, however clear justification for this has been set out in the Heritage Statements.

We very much welcome the inclusion of heritage interpretation at Greenfield Station. This is a significant early rail route and there is notable educational potential in the material that has been generated from the research into the railway structures as part of this project.

Regarding Oaklands Road underbridge MVL3/25, we are comfortable with the design of the proposals for the reconstruction of the parapet and stone turrets. These have been carefully considered to minimise the visual impact.

Next Steps

We appreciate having been involved at pre-application stage in this important project, and value being able to feed into design plans. If you require further pre-application advice please get in touch.

Yours sincerely

1. INTRODUCTION

1.1 Transpennine Route Upgrade

1.1.1 The Transpennine Route Upgrade (TRU) is a major, multi-billion pound program of improvements to increase capacity, improve journey time and reliability performance of rail services on the Transpennine Route.

1.1.2 The TRU will aim to deliver:

- An improved journey time for Leeds – Manchester Victoria of 42-44mins;
- An improved journey time for York to Manchester Victoria of 65-67mins;
- Capability to operate four 'express' and two 'semi-express' services an hour;
- Capability to operate up to two 'local services' an hour on the route;(subject to future operating timetables);
- Performance of the Transpennine Route to be 92.5% or higher each period;
- Larger freight containerisation capability (W12 gauge);
- Freight paths/rights to be retained as existing; and
- A contribution to Network Rail's Decarbonisation Strategy and climate policy.

1.1.3 The Network Rail (Stalybridge to Diggle (Saddleworth) Enhancements) Order extends from Stalybridge Tunnel, in the west, through to the western portal of Standedge Tunnel (the "Order Scheme"). This section of the Transpennine Route follows the Tame Valley from Stalybridge to Diggle, and is referred to hereafter as Route Section W2B.

1.1.4 The TRU programme in Route Section W2B involves a variety of works including the electrification of the railway (installation of overhead line equipment (OLE) and associated infrastructure, reconstruction and modification of existing bridges to facilitate electrification of the railway, construction of a new station at Mossley, closure of Stockport Road Level Crossing and Moorgate Halt Level Crossing, railway works at Greenfield Station to support the upgrade and electrification of the railway track reconfiguration works and track lowering works through Stalybridge and Scout Tunnels.

1.1.5 Under the Planning (Listed Buildings and Conservation Areas) Act 1990, consent is required from the local planning authority for any proposed works that would affect the character of a listed building. The Transport and Works Act 1992 introduced section 12(3A) into the Planning (Listed Buildings and Conservation Areas) Act 1990, the effect of which is to "call-in" for determination by the Secretary of State applications to the local planning authority for listed building consent where such consent is required in consequence of proposals included in an application for a Transport and Works Act Order (TWAO). The procedures in the Transport and Works Applications (Listed Buildings, Conservation Areas and Ancient Monuments Procedure) Regulations 1992 then apply to the call in of such listed building consent applications.

1.1.6 This Heritage Statement has been compiled in support of an application for listed building consent by Network Rail in respect of the proposed works on the grade ll listed Roughtown Road Overbridge (MVL3/17) (NHLE 1452405). This bridge is located to the north of Mossley in Roughtown (NGR SD9772402832), Tameside. A location plan is provided in Appendix A.

1.1.7 The Historic England list description (included in full in Appendix B) names the listed building as “Railway Overbridge MVL3/17, Roughtown Road”. Throughout this Heritage Statement the structure is referred to as “Roughtown Road Overbridge (MVL3/17)” in accordance with Network Rail’s naming of the structure.

1.1.8 The preparation of this assessment has been informed by the Statement of History and Significance: West of Leeds (Alan Baxter Associates, 2024) and the Route-wide Statement of Significance (Alan Baxter Associates 2019).

1.2 Scope

1.2.1 The requirement for assessment and its scope is guided by policy contained within the National Planning Policy Framework (NPPF, revised 2025) specifically paragraph 207, which seeks an assessment proportionate to the assets’ importance and sufficient to understand the potential impacts of development. The specific scope of this assessment is determined by Network Rail’s requirement to provide an objective assessment of the heritage value of assets that may be affected by the Order Scheme, and to appraise the nature and extent of any impact upon setting and significance.

1.2.2 This Heritage Statement will:

- Identify and discuss the heritage significance of the listed structure, including the contribution of setting;

- Present the design requirements of the Order Scheme at the structure;
- Present the process of development and optioneering which has led to the design proposal for the Order Scheme in relation to the structure;
- Identify the impacts of the design proposal on the significance of the structure, in the context of current national and local planning policy and guidance;
- Discuss any mitigation recommended in relation to the structure; and
- Consider the public benefits to be gained from the Order Scheme weighed against the impact on the significance of the structure, in line with the National Planning Policy Framework, 2024 and the Tameside Unitary Development Plan Written Statement, 2004.

1.3 Current conditions

1.3.1 Roughtown Road Overbridge (MVL3/17) (Insert 1-1) is a mid to late 1840s masonry overbridge, designed by Alfred Stanistreet (A.S.) Jee for the Huddersfield and Manchester Railway. The overbridge is located to the north of Mossley, and comprises a single segmental arch bridge which carries Roughtown Road over the Transpennine route.

1.3.2 Roughtown Road Overbridge (MVL3/17) was subject to a detailed examination as part of Network Rail's maintenance regime in April 2022, which assessed the overbridge to be in an overall fair condition. A number of minor defects identified in this assessment include:

- Open joints across the structure;
- Small-scale vegetation growing within open joints, shrubs and trees close to abutments (Insert 1-2);
- Weathering and damp staining across the structure suggesting that damp coursing has failed;
- Fractures within stonework;
- Displaced stonework (Insert 1 2);
- Broken and missing reflective bollards at the east end of the bridge; and
- Absence of bridge strike emergency ID plates from the parapet.

Insert 1-1 Roughtown Road Overbridge (MVL3/17), view from south.

Insert 1-2 Displaced masonry and vegetation growth on Roughtown Road Overbridge MVL3/17

1.4 Summary of proposal

1.4.1 In order to achieve the TRU programme objectives, electrification of the route is required. This would require the alteration of a number of existing overbridges, including Roughtown Road Overbridge (MVL3/17) to accommodate OLE, higher line speed and increased freight trains. It has been determined to be necessary to undertake minor adjustments to the structure, including raising the parapets in line with Network Rail Safety Regulations and attaching OLE to the underside of the bridge arch. These works would therefore enable implementation of the Order Scheme.

2. LEGISLATION AND POLICY CONTEXT

2.1 Legislation

2.1.1 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) ("Act") governs the designation and works to listed buildings in England.

2.1.2 The Act states in s.1 (5):

'*In this Act "listed building" means a building which is for the time being included in a list compiled or approved by the Secretary of State under this section; and for the purposes of this Act—*

a) any object or structure fixed to the building;

b) any object or structure within the curtilage of the building which, although not fixed to the building, forms part of the land and has done so since before 1st July 1948, shall be treated as part of the building.'

2.1.3 Under the Act, no one is permitted to undertake or cause to be undertaken any works that would affect the character of a listed building unless the works are authorised. Section 16 of the Act identifies that whether such works can be carried out is determined by the local planning authority or the Secretary of State:

a) 'Subject to the previous provisions of this Part, the local planning authority or, as the case may be, the Secretary of State may grant or refuse an application for listed building consent and, if they grant consent, may grant it subject to conditions.

b) In considering whether to grant listed building consent for any works the local planning authority or the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any

features of special architectural or historic interest which it possesses.

c) *Any listed building consent shall (except in so far as it otherwise provides) ensure for the benefit of the building and of all persons for the time being interested in it.'*

2.1.4 In relation to the granting of listed building consent, Section 17 of the Act stipulates that conditions attached to listed building consent may include those with respect to:

a) *'the preservation of particular features of the building, either as part of it or after severance from it;*

b) *the making good, after the works are completed, of any damage caused to the building by the works; [and]*

c) *the reconstruction of the building or any part of it following the execution of any works, with the use of original materials so far as practicable and with such alterations of the interior of the building as may be specified in the conditions'.*

2.1.5 It is also defined in s.17 (2) that a condition *'may also be imposed requiring specified details of the works (whether or not set out in the application) to be approved subsequently by the local planning authority or, in the case of consent granted by the Secretary of State, specifying whether such details are to be approved by the local planning authority or by him'.*

2.1.6 The Act also states in s.66 (1):

'*In considering whether to grant planning permission or permission in principle for development which affects a listed building or its setting, the local planning authority or, as the case may be, the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses'.*

2.2 National Policy

2.2.1 The National Planning Policy Framework (NPPF, 2025) sets out the Government's planning policies for England and how these should be applied to contribute to the achievement of sustainable development, supported by the Planning Practice Guidance (PPG; updated July 2019) (MHCLG, 2019).

2.2.2 Section 2 of the NPPF outlines the principles of achieving sustainable development including, in Paragraph 8, an environmental objective 'to protect and enhance our natural, built and historic environment'. Paragraph 9 sets out that these objectives should be delivered through the preparation and implementation of plans and the application of the policies within the NPPF. Section 16 of the NPPF deals specifically with the historic environment. Where changes are proposed, the NPPF sets out a clear framework to ensure that heritage assets are conserved, and where appropriate enhanced, in a manner that is consistent with their significance.

2.2.3 This Heritage Statement aims to address relevant policy within the NPPF in relation to Section 16 'Conserving and enhancing the historic environment' and includes guidance on assessment of significance of heritage assets and their setting that may be affected by the proposed works and how to consider potential impacts on significance.

2.2.4 The following paragraphs as set out in the NPPF include key provisions considered of particular importance to this application:

- Paragraph 207 – '*In determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand the potential impact of the proposal on their significance*.'
- Paragraph 212 – '*When considering the impact of a proposed development on the significance of a designated heritage asset, great weight should be given to the asset's conservation (and the more important the asset, the greater the weight should be). This is irrespective of whether any potential harm amounts to substantial harm, total loss, or less than substantial harm to its significance*.'
- Paragraph 213 – '*Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification. Substantial harm to or loss of*:

a) grade II listed buildings, or grade II registered parks or gardens, should be exceptional;

b) assets of the highest significance, notably scheduled monuments, protected wreck sites, registered battlefields, grade I and II listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional*.'

- Paragraph 214 – '*Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss, or all of the following apply:*

  a. *the nature of the heritage asset prevents all reasonable uses of the site; and*

  b. *no viable use of the heritage asset itself can be found in the medium term through appropriate marketing that will enable its conservation; and*

  c. *conservation by grant-funding or some form of not for profit, charitable or public ownership is demonstrably not possible; and*

  d. *the harm or loss is outweighed by the benefit of bringing the site back into use*.'

- Paragraph 215 – '*Where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate, securing its optimum viable use*.'
- Paragraph 216 – '*The effect of an application on the significance of a non-designated heritage asset should be taken into account in determining the application. In weighing applications that directly or indirectly affect non-designated heritage assets, a balanced judgment will be required having regard to the scale of any harm or loss and the significance of the heritage asset*.'
- Paragraph 219 - '*Local planning authorities should look for opportunities for new development within Conservation Areas and World Heritage Sites, and within the setting of heritage assets, to enhance or better reveal their significance. Proposals*

that preserve those elements of the setting that make a positive contribution to the asset (or which better reveal its significance) should be treated favourably.'

Planning Practice Guidance

2.2.5 The Planning Practice Guidance (PPG) (MHCLG, 2019) provides further advice and guidance that expands the policy outlined in the NPPF. It expands on terms such as 'significance' and its importance in decision making. The PPG clarifies that being able to properly assess the nature, extent and the importance of the significance of the heritage asset and the contribution of its setting, is very important to understanding the potential impact and acceptability of development proposals (paragraph 008 Reference ID: 18a-008-20190723).

2.2.6 The PPG states that in relation to setting, a thorough assessment of the impact on setting needs to take into account, and be proportionate to, the significance of the heritage asset under consideration and the degree to which proposed changes enhance or detract from that significance and the ability to appreciate it (paragraph 009 Reference ID: 18a-009-20190723).

2.2.7 The extent and importance of setting is often expressed by reference to visual considerations. Although views of or from an asset will play an important part, the way in which an asset is experienced in its setting is also influenced by other environmental factors such as noise, dust and vibration from other land uses in the vicinity, and by our understanding of the historic relationship between places.

2.2.8 Paragraph 013 of the PPG recognises that the contribution that setting makes to the significance of the heritage asset does not depend on there being public right or the ability to experience that setting. When assessing any application for development which may affect the setting of a heritage asset, local planning authorities may also need to consider the implications of cumulative change (Paragraph: 013 Reference ID: 18a-013-20190723 Revision date: 23 07 2019).

2.2.9 In relation to substantial harm, the PPG states that 'it is the degree of harm to the asset's significance rather than the scale of the development that is to be assessed' (paragraph 017). Harm to heritage assets can be avoided or minimised if proposals are based on a clear understanding of the heritage asset and its setting (paragraph 008 Reference ID: 18a-008-20190723). The NPPF indicates that the degree of harm should be considered alongside any public benefits that can be delivered by development.

2.3 Local planning policy

Tameside Unitary Development Plan

2.3.1 The Tameside Unitary Development Plan 2004 is part of the statutory Local Plan policies for the Tameside Metropolitan Borough (TMBC) which provides the set of planning policies which make up the current local plan.

2.3.2 The Tameside Unitary Development Plan sets out local planning policies that 'provide a framework for development and conservation over the whole of the Tameside area, to set out the main considerations on which planning applications in the Borough are determined, and to guide land use decisions by the Council and other agencies.'

2.3.3 Policies within the framework which are relevant to this Heritage Statement are outlined below.

Policy C Conservation and Enhancement of the Built Environment.

Policy C1 Townscape and Urban Form

In considering proposals for built development, the Council will expect the distinct settlement pattern, open space features, topography, townscape and landscape character of specific areas of the Borough to be understood, and the nature of the surrounding fabric to be respected. The relationship between buildings and their setting should be given particular attention in the design of any proposal for development.

Urban design frameworks will be produced for particular areas and corridors in the Borough, as supplementary planning guidance, setting out fundamental principles which should be followed and from which detailed design may be interpreted.

The Council will establish a strategy to secure the retention and enhancement of landmark buildings which form a distinctive element of the local skyline or townscape, and which represent a unique part of the heritage of the area. Re-use and conversion of such buildings which become redundant will be permitted, subject to other relevant policies.

Policy C5 Alternative Uses, Alterations and Additions for Listed Buildings

Whilst continuation of the use for which the building was designed is most desirable, the Council will permit alternatives uses for Listed Buildings where evidence demonstrates that the existing or original

use is unlikely to support the maintenance and preservation of the building.

The Council will require that proposed new uses, or other alterations and additions to Listed Buildings, should not adversely affect the essential character of the building, should be in keeping with its architectural style and features, and should harmonise with its surroundings. The effect of the proposals on any protected species which may be using the Listed Building should also be taken into account.

Such development must be of a high standard of design. The external appearance, design and materials will be expected to match as near as possible those of the existing building and, where appropriate, new internal features should also harmonise with the existing.

Extensions and additions should be secondary in scale, design and location to the principal building and standard solutions or modern features which fail to relate to the character of the building will not be permitted

Policy C6: Setting of Listed Buildings

New development, including any proposed as a result of a new use for a Listed Building, which fails to preserve, or detracts from, the setting of a Listed Building or structure will not be permitted.

Policy C8 Demolition of Listed Buildings

The Council will not recommend the demolition of Listed Buildings, apart from in exceptional circumstances after the following considerations have been assessed:

the condition of the building and the cost of repairing and maintaining it in relation to its importance and to the value derived from its continued use, and

the adequacy of efforts that have been made to retain the building in its present use or to find compatible alternative uses, and

the merits of alternative proposals for the site.

In such circumstances the Council will also need to be satisfied that an acceptable alternative form of development can go ahead on the site as soon as practical following demolition, that any use of the building by protected species has been taken into account, and that provision can be made to record the detail of the building prior to demolition.

Places for Everyone

2.3.4 Places for Everyone (Greater Manchester Combined Authority 2024) is a joint development plan covering nine Greater Manchester districts including Tameside, setting out a framework for sustainable development. Policy JP-P2 concerns Heritage and is of relevance to this assessment:

2.3.5 *Policy JP-P2: Heritage*

2.3.6 *We will proactively manage and work with partners to positively conserve, sustain and enhance our historic environment and heritage assets and their settings. Opportunities will be pursued to aid the promotion, enjoyment, understanding and interpretation of heritage assets, as a means of maximising wider public benefits and reinforcing Greater Manchester's distinct character, identity and sense of place.*

2.3.7 *Local Plans will set out the key elements which contribute to the district's identity, character and distinctiveness and which should be the priority for conserving and enhancing in the future and demonstrate a clear understanding of the historic environment and the heritage values of sites, buildings or areas and their relationship with their surroundings. This knowledge should be used to inform the positive management and integration of our heritage by:*

2.3.8 *Setting out a clear vision that recognises and embeds the role of heritage in place-making;*

2.3.9 *Ensuring that the heritage significance of a site or area is considered in accordance with national planning policy in the planning and design process and opportunities for interpretation and local engagement are optimised;*

2.3.10 *Integrating the conservation and enhancement of heritage assets and their settings, with creative contextual architectural responses that contribute to their significance and sense of place;*

2.3.11 *Delivering positive benefits that sustain and enhance the historic environment, as well as contributing to the economic viability, accessibility and environmental quality of a place, and to social wellbeing; and*

2.3.12 *Exploring opportunities to reduce greenhouse gas emissions that restoration of historic buildings offer.*

2.3.13 *Particular consideration will be given to ensure that the significance of key elements of the historic environment which contribute to Greater Manchester's distinctive identity and sense of place are*

protected from harm. These include historic town centres, places of worship, historic transport routes including the canal network, industrial buildings and structures including textile mills, farmsteads and other sites, buildings, and areas of identified archaeological, architectural, artistic and/or historic value. Development proposals affecting designated and non-designated heritage assets and/or their settings will be considered having regard to national planning policy. Where heritage assets have been identified as being at risk, Local Plans should identify specific opportunities for them to contribute to regeneration and place-making, and they should set out strategies for their repair and re-use. Development proposals which will help safeguard the significance of and secure a sustainable future for Greater Manchester's heritage at risk will be supported in principle, provided they are not contrary to national policy or other policies in the development plan. Proposals should be informed, as necessary, by the findings and recommendations of the appropriate heritage assessment(s) in the development plan evidence base and/or any updated heritage assessment submitted as part of the planning application process.

Historic England Guidance

2.3.14 Historic England has published a series of Good Practice Advice (GPA) notes and Advice Notes (AN) of which those of most relevance to this appraisal are GPA2 – Managing Significance in Decision-taking (Historic England, 2015), GPA3 – The Setting of Heritage Assets (Historic England, 2017), and AN12, Statements of Heritage Significance (Historic England, 2019).

2.3.15 GPA2 – Managing Significance in Decision-taking emphasises the importance of having a knowledge and understanding of the significance of heritage assets likely to be affected by the development and that the 'first step for all applicants is to understand the significance of any affected heritage asset and, if relevant the contribution of its setting to its significance' (paragraph 4). Early knowledge of this information is also useful to a local planning authority in pre-application engagement with an applicant and ultimately in decision making (paragraph 7).

2.3.16 GPA3 – The Setting of Heritage Assets provides advice on the setting of heritage assets. Setting is as defined in the NPPF and comprises the surroundings in which a heritage asset is experienced. Elements of a setting can make positive or negative contributions to the significance of an asset and affect the ways in which it is experienced. Historic England state that setting does not have a boundary and what comprises an asset's setting may change as the asset and its surrounding evolve. Setting can be extensive and particularly in urban areas or extensive landscapes can overlap

with other assets. The contribution of setting to the significance of an asset is often expressed by reference to views and the GPA in paragraph 11 identifies those views, such as those that were designed or those that were intended, that contribute to understanding the significance of assets.

2.3.17 AN12, Statements of Heritage Significance outlines a recommended approach to assessing the significance of heritage assets in line with the requirements of NPPF. It includes a suggested reporting structure for a 'Statement of Heritage Significance,' as well as guidance on creating a statement that is proportionate to the asset's significance and the potential degree of impact of a proposed development. The AN also offers an interpretation of the various forms of heritage interest that an asset can possess, based on the terms provided in the NPPF Glossary (Annex 2); namely archaeological, architectural, artistic, and historic.

3. ASSESSMENT METHODOLOGY

3.1 Research

3.1.1 In accordance with Historic England guidance and as determined by policy requirements, this assessment identifies the baseline heritage interest of Roughtown Road Overbridge (MVL3/17). The historical narrative informing the baseline has been derived from a review of various resources including maps and other cartographic and photographic sources. Statutory information in relation to the designated assets has been obtained from the National Heritage List for England maintained by Historic England and the Historic Environment Record maintained by Greater Manchester Archaeology Advisory Service.

3.1.2 Additional information concerning the assets, their condition, use and setting has been obtained from a survey undertaken by suitably qualified and experienced heritage specialists on 21 and 22 May 2024, including observation from surrounding vantage points and informed by appraisal and observation derived from close working with other disciplines within the project team.

3.2 Significance and setting

3.2.1 Assessment of the significance of heritage assets and their setting has been undertaken in consideration of guidance issued by Historic England. Significance is often established by statutory designations such as listed buildings, scheduled monuments and conservation areas. More particular advice as to what makes up significance is set out in AN12, which establishes a method for thinking consistently about the heritage values that can be ascribed to a place. When

making an assessment of significance, numerous aspects are considered including architectural interest, historic interest, group value, social value, former uses and local distinctiveness. These aspects are grouped into four values defined in Annex 2 of the NPPF as historical interest, archaeological interest, artistic interest, and architectural interest..

3.2.2 In assessing whether the setting of an asset contributes to its significance, and in assessing the effect of development, Historic England GPA3 provides a checklist of attributes that may affect setting and significance under five broad categories comprising:

- The location and siting of the development;
- The form and appearance of the development;
- Additional effects (change to skyline etc.);
- Permanence;
- Consequential effects.

4. CONSULTATION

4.1.1 Historic England and TMBC have been involved in ongoing stakeholder consultation with Network Rail through the development of Route Section W2B of the TRU.

4.1.2 Regular meetings with Historic England and TMBC have been held to discuss design development of the proposals in relation to Roughtown Road Overbridge (MVL3/17). Initial meetings were held periodically throughout 2021 and resumed in 2024 to discuss the overall route and design development for all structures along Route Section W2B.

4.1.3 The design development for Roughtown Road Overbridge (MVL3/17) was presented and discussed with the historic environment stakeholders on the following dates:

Table 4-1 Consultation for Roughtown Road Overbridge (MVL3/17)

Date	Stakeholder in attendance	Key agreements/items discussed
2 March 2021	• TMBC	• An overview of the optioneering for each structure within the TMBC boundary was outlined by Network Rail. • Preferred option presented at this stage for Roughtown Road Overbridge (MVL3/17) was for track slewing and to raise the parapets height to 1850mm (option 1, see paragraph 6.2.4) .
6 February 2024	• Historic England	• Details of the challenges of the electrification of the route in relation to listed overbridges were presented. Design measures under consideration for addressing these challenges noted to include: - Reduced voltage clearances • Development of scheme-specific pantograph, reducing electrical clearances to a minimum. • Site specific risk assessments of bridges due to reduced overhead wire heights. - Electrical protection works • Risk-based approach to raising parapets. Where safe to do so, 1.5 m height parapets may be employed, rather than standard 1.8 m height. • This approach has been embedded in designs for the Order Scheme. • The design approach for electrification across / under existing railway bridges was noted to

Date	Stakeholder in attendance	Key agreements/items discussed
		have agreed in principle by Network Rail and following consultation with the Local Authorities & Historic England at the preceding design stage • Confirmation that the design optioneering would be undertaken in consultation with Historic England.
5 March 2024	• Historic England	• Confirmation that Roughtown Road Overbridge (MVL3/17) is amongst the structures being retained.
19 March 2024	• TMBC	• Meeting to discuss the electrical protection works to the seven listed structures, including Roughtown Road (MVL3/17). Principles of electrification works were presented and included the use of a risk-based approach to reduce the impact to the existing structures. • The proposed works to Roughtown Road (MVL3/17) include increasing the parapet height to 1.5m and replace existing copers with triangular copers,
9 April 2024	• Historic England	• Presentation of proposal for coloured concrete copers at Roughtown Road Overbridge (MVL3/17). Historic England welcomed the opportunity to colour match the concrete to the existing structure as this would be less visually intrusive.

Date	Stakeholder in attendance	Key agreements/items discussed
7 May 2024	• Historic England	• Agreement in principle with Historic England on the requirement for electrical protection work and parapet raising at Roughtown Road Overbridge (MVL3/17). • Proposals for alteration of Roughtown Road Overbridge (MVL3/17) noted to include modification of the track to accommodate clearance. • Design development process noted to include challenge of Network Rail standards to retain the listed structure. • Confirmation that the parapet raising to 1.5 m would be achieved by using triangular concrete copers coloured to blend with historic structure and remove sitting risk. • Parapet raising would utilise a risk-based approach to reduce impact to the structure, enabling raising of the parapet to be reduced from 1.8 m to 1.5 m.
24 May 2024	• TMBC	• This meeting was used to outline to members of the Local Planning Authority (following changes in personnel) the significance of Roughtown Road Overbridge (MVL3/17), along with site specific constraints and the design approach for the preferred option agreed of track slewing and parapet height raising (option 1).

Date	Stakeholder in attendance	Key agreements/items discussed
		• TMBC expressed preference for use of stone copers in keeping with the structure's historic character.
25 June 2024	• Historic England	• Pre-application advice letter from Historic England identifies that the proposed works to MVL3/17 would result in a low level of less than substantial harm resulting from the change in appearance and loss of original copers (see Appendix C for the full response letter). • It was suggested that using stone instead of concrete and any undertaking restoration works would help to lessen the impact.
27 August 2024	• Historic England	• This meeting was used to present the draft listed building consent drawings to Historic England and to discuss the proposals presented in the drawings. • The design team presented the need to use coloured concrete copers due to structural constraints which was accepted by Historic England. • Historic England raised whether other repairs would be undertaken to mitigate impact of copers in which it was confirmed that the arch would be refurbished to meet the new electrical standards. • In discussion about how OLE would be attached to the structure, Historic England expressed preference for attaching on the underside of the arch rather than the freestanding mast.

Date	Stakeholder in attendance	Key agreements/items discussed

3 September 2024	• TMBC	• Discussion around draft LBC drawings for MVL3/17 and further conversation around the coloured concrete copers for this structure due to weight loading and structural constraint. This would be undertaken to match the existing. The council recognised the constraint and requested for justification to be provided in the Heritage Statement
		• OLE attachment options were also presented in two options:
		  • Option 1 - Having gantries (OLE arms) next to the structure which would have a greater visual impact and would have free running cables under the structure.
		  • Option 2 - Fixtures on the underside of the structure.
		• Details of the OLE attachment would be provided as part of the listed building consent application.

17 September 2024	• Historic England	• Extended pre-application advice letter from Historic England (see Appendix C) identifies that:
		  ○ Acknowledge that the introduction of new copers and increased parapet height would result in a noticeable change though would amount to a low level of less than substantial harm.
		  ○ Mitigation of harm through careful design of the new copers and their interaction with the bridge piers was highlighted.

Date	Stakeholder in attendance	Key agreements/items discussed
1 October 2024	• TMBC	• Meeting to provide update to Roughtown Road (MVL3/17) following from the comments received from Historic England. • Clarification to the council that the OLE portals would be at a greater distance than what the visualisations show, and the bridge arm would be attached to the underside of the arch barrel.

28 March 2025	• TMBC	• Consultation to go over the draft Heritage Statements. Comments raised, during this meeting and have since been actioned include:
		  • Request for inclusion of Historic England feedback in appendix to the Heritage Statements
		  • Request for condition surveys subject to Network Rail's approval
		  • Request for further emphasis of public engagement in the reports

4 April 2025	• Historic England	• Overview of draft comments from Historic England. Request to draw out the heritage interpretation in the reports as part of the heritage benefits.
18 July 2025	• Historic England	• Pre-application advice letter received from Historic England providing overarching feedback on proposals affecting listed bridges between Stalybridge and Standedge Tunnel (see Appendix C). • Acknowledgment given to the collaborative approach taken at pre-application stage, to fully explore alternative options to reconstruction and for the opportunity for Historic England to feed into design plans. • The heritage statements adjudged to be well considered with clear justification having been provided for the substantial harm identified to those structures proposed for removal or reconstruction. • The inclusion of interpretation at Greenfield Station is welcomed by Historic England.

5. HERITAGE ASSSETS AND THEIR SIGNIFICANCE

5.1 History of the W2B Transpennine Route

5.1.1 The railway connecting Stalybridge to Huddersfield, which runs under Roughtown Road Overbridge (MVL3/17) was constructed by the Huddersfield & Manchester Railway Company between 1846 and 1849. The mid-1840s was a period of commercial confidence and massive expansion in the railway network across England, known as 'Railway Mania' which has been described by Historic England as the Heroic Age of railway building (1841-1850) (Historic England, 2017). Between 1845 and 1852 the railway network expanded from 2,345 miles to 7,272 miles (3774km to 11,703km) (Alan Baxter Associates, 2019). Constructed at the height of this boom, the Stalybridge to Leeds line was a product of this trend. Traversing a challenging landscape through the Pennines, the line was planned to follow the route of the Huddersfield Narrow Canal for much of its length, with the canal acquired by the Railway Company the year after its authorisation (Alan Baxter Associates, 2019). These difficult landscape conditions resulted in the need to build several major viaducts and tunnels. These included Standedge Tunnel through the Pennines, which was constructed alongside the 1811 canal tunnel and is 'indisputably significant as a major engineering achievement' (Alan Baxter Associates 2024).

5.1.2 The development and expansion of the railways during the 19th century transformed the landscape and settlements through which they passed, fuelling industrial growth and settlement expansion. The impact of improved communications, first with the arrival of the canal in 1811, and then the railway in 1849, provided valuable links with Huddersfield, Manchester and Leeds, enabling import of raw materials and export of manufactured goods. This fuelled the gradual industrialisation and settlement expansion along the Tame Valley. This can be seen on historic Ordnance Survey maps dating from the 19th and early 20th century where industrial development including mills, dyeworks, printworks and quarries, is shown to have been present along the route of the railway and extending into the more upland areas around Saddleworth and Harrop Dale, whilst settlements such as Mossley and Dobcross gradually expanded.

5.1.3 Roughtown Road Overbridge (MVL3/17) was constructed for the Huddersfield & Manchester Railway Company in the mid to late 1840s. The principal engineer for the Huddersfield & Manchester Railway was Alfred Stanistreet (A. S.) Jee (1816–1858), who was assisted by the more renowned engineer Joseph Locke (1805–1860). Jee's work on the Huddersfield & Manchester Railway represents, arguably, his greatest achievement. This can be seen particularly in the construction of the Standedge Tunnel, which at

over three miles long was one of the longest and most difficult in England, but also through the various large-scale viaducts along the route. In the 1850s, he worked internationally on the Spanish line from Alar-del-Rey to Reynosa where his skill in design, his accuracy and his completeness of the details earned him high praise. He died in a fatal accident upon the opening of the second portion of that line.

5.1.4 In 1847, prior to the opening of the line, the Huddersfield & Manchester Railway Company was taken over by the London and North Western Railway (LNWR). As part of the LNWR network, the Huddersfield & Manchester Railway formed part of a direct route from Manchester to the West Riding, enabling the LNWR to access the textile and coal industries of West Yorkshire. By 1851, the LNWR was the most prominent railway company of the period, with over 800 miles of track and was the largest joint-stock concern of its time, capitalised at £29 million. The line was acquired by the London Midland and Scottish Railway in 1923, before being nationalised in 1948.

5.1.5 Whilst other parts of the Transpennine route were subject to significant alterations, the Huddersfield & Manchester Railway between Standedge Tunnel and Stalybridge was subject to relatively limited alteration. The Micklehurst Loop was constructed from 1881-85 to provide additional capacity, and diverged from the existing railway to the east of the Tame Vally, avoiding physical interaction with the majority of its alignment. A new junction to the south of Greenfield Station is shown on historic maps from the early 20th century as additional tracks toward Oldham were established from this station. However similarly to the Micklehurst loop, the additional lines diverged from the main Huddersfield line, running westwards at its intersection with Shaw Hall Bank Road Footway (MVL3/26). The railway was also widened to the east of Diggle to accommodate additional tracks serving new bores for the Standedge Tunnel which were added in 1868-71 and 1894, necessitating widening of bridges to the east of the route.

5.1.6 Piecemeal change has occurred on the Huddersfield & Manchester Railway, most notably with the closure of a small number of stations along the route, such as Diggle and Saddleworth Stations. The route today forms part of the wider Transpennine route between York, Selby and Manchester, which comprises sections of rail line developed by different railway companies.

5.1.7 The history and significance of the Transpennine route is discussed at more length in the Route-Wide Statement of Significance (Alan Baxter Associated, 2019). This was produced to characterise the overall heritage significance of the Transpennine route

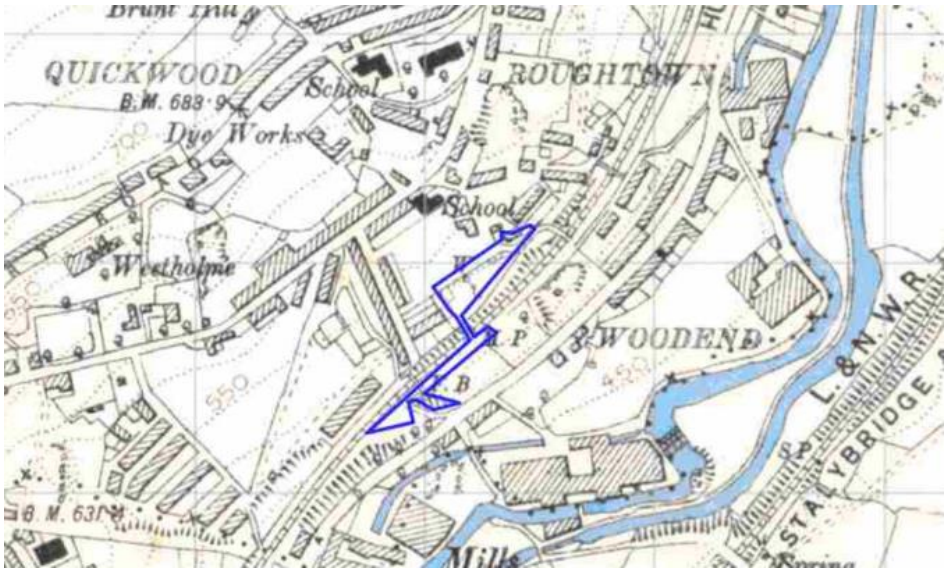
5.2 Roughtown Road Overbridge (MVL3/17)

History

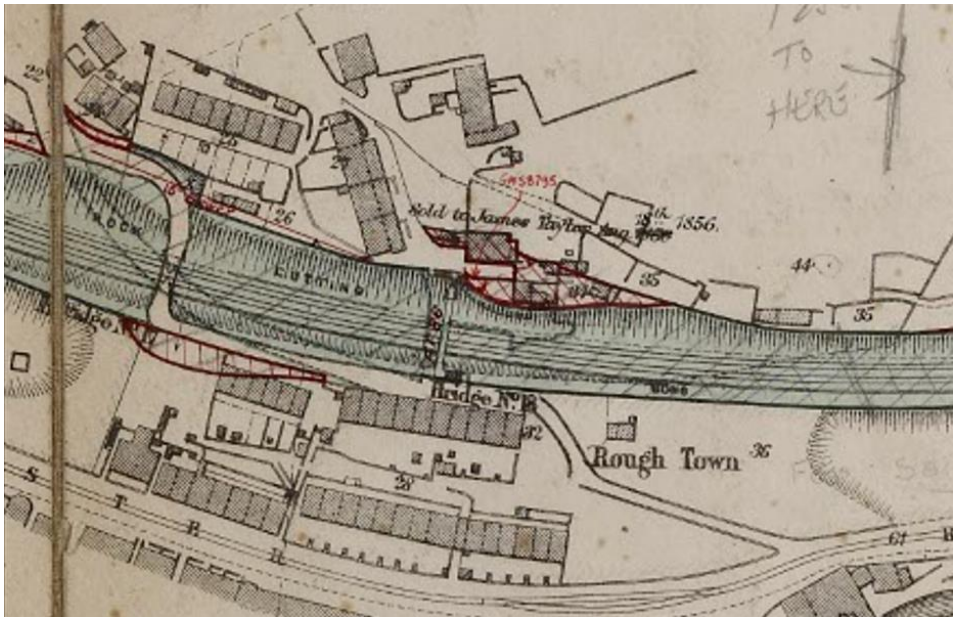
5.2.1 Roughtown Road Overbridge (MVL3/17) was constructed between 1845 and 1849 during the Heroic Age of railway building. The single-span bridge was designed by A.S. Jee for the Huddersfield & Manchester Railway and is situated within the suburb of Roughtown, to the north of Mossley.

5.2.2 At the time of the construction of the Huddersfield & Manchester Railway, Roughtown comprised a scattered neighbourhood of houses which was rapidly being amalgamated into the expanding town of Mossley. This expansion was fuelled by the growth of the town's textile industry, aided by the arrival of the Huddersfield Narrow Canal in 1811 and the Huddersfield & Manchester Railway in the mid-19th century as they helped to improve connectivity with surrounding markets and villages. The Six-Inch Ordnance Survey map of 1854 (not reproduced here) depicts Roughtown Road Overbridge carrying a local road across the railway cutting linking the hamlet with Rough Town Mill (cotton) which was located adjacent to the River Tame to the east of the railway line.

5.2.3 The County Series Map 1891 (Insert 5-1) shows further expansion of Mossley and industry to surround the hamlet of Roughtown. Multiple mills and an iron foundry are depicted along the River Tame to the east of the Transpennine Route, whilst expansion of the settlement is focussed to the west with rows of closely packed worker's housing, schools and a church. The alignment of the railway running north-east to south-west through Roughtown and Mossley divided residential areas to the west of the line from the industry focussed along the River Tame. The historic line plan drawings from 1905 show that Roughtown Road Overbridge (MVL3/17) was therefore an important link which maintained connectivity between the east and west of the line (Insert 5-2).



Insert 5-1 County Series Map 1891.



Insert 5-2 1905 historic line plans produced by LNWR showing Roughtown Road Overbridge (MVL3/17).

5.2.4 Throughout the 20th century, the general morphology of the area did not undergo any significant change (Insert 5-3 to Insert 5-7). The mills remained extant until the mid-20th century however these were removed before the 21st century and superseded by a modern industrial estate. Roughtown Road Overbridge (MVL3/17) is shown to have remained in use carrying a road over the railway line.

Description

5.2.5 Roughtown Road Overbridge (MVL3/17) is a single-span overbridge with battered abutments which carries Roughtown Road over the Transpennine route. The railway crossing is aligned north-west to south-east, sloping downwards towards the south-east due to the gradient of the local topography, and spans the two-track railway line which is set within a deep cutting. The bridge survives in largely its original form, with limited evidence of alteration.

5.2.6 Roughtown Road Overbridge (MVL3/17; Insert 5-8 and Insert 5-9) is constructed of regular-coursed, rock-faced buff sandstone. The overbridge is formed by a segmental arch flanked by raking abutments with curved wing walls which terminate in slender pilasters with pyramidal caps. The arch springs from ashlar impost bands. It is formed by rusticated v-jointed gritstone voussoirs with tooled margins which continue as quoins to the soffits. The arch keystone is emphasised and breaks above and below the arch, a characteristic decorative feature of Jee's work for the Huddersfield & Manchester Railway. Above the arch is a squared ashlar string course which supports a parapet of coursed rock-faced stone with coping over. The arch soffit is comprised of narrow courses of masonry with tooled detailing (Insert 5-10). Some limited evidence of modern repair to the structure is apparent comprising a short section of rendered parapet copings in the south-west corner, and a short cement kerb with modern bollards installed next to the inner face of the south-west corner.

5.2.7 The setting of Roughtown Road Overbridge (MVL3/17) maintains its historic integrity given the minor changes which have occurred to its environs since the mid-19th century. Its ongoing use connecting Roughtown to the north-west with the Woodend Mill to the south-east retains the legibility of this link and contributes towards its significance. Views of the underbridge can be appreciated from the footbridges to the north-east and south-west. Its location on a steep south-eastern slope provides fortuitous views of its setting from the bridge deck. Views from the bridge deck also take in the Woodend Mill to the south, and Roughtown to the north-west Insert 5-11 to Insert 5-15) enabling for an appreciation of its wider setting, and its relationship with the railway. However, there is limited visibility for the train passengers themselves.

Insert 5-8 Roughtown Road Overbridge (MVL3/17), south-east elevation.

Insert 5-9 Roughtown Road Overbridge (MVL3/17), north-west elevation.

Insert 5-10 Roughtown Road Overbridge (MVL3/17), detail of arch and soffit

Insert 5-11 Roughtown Road Overbridge (MVL3/17), view east across the bridge deck

Insert 5-12 Roughtown Road Overbridge (MVL3/17), view looking north-east from the across the bridge deck.

Insert 5-13 Roughtown Road Overbridge (MVL3/17), view looking south-west from the across the bridge deck.

Insert 5-14 Roughtown Road Overbridge (MVL3/17), looking east from the end of the bridge deck with the former Cotton Mill (now Warmco Woodend Mill) in the distance.

Insert 5-15 Roughtown Road Overbridge (MVL3/17), looking west from the end of the bridge deck with the spire of St John the Baptist Church visible.

Significance

5.2.8 Roughtown Road Overbridge (MVL3/17) was designated as a grade II listed building in March 2018. The Historic England List Entry description identifies the bridge to be of special interest for to the following reasons:

- Historic interest:
    - Constructed during the Heroic Age of railway building and a little-altered example of an 1840s overbridge on what is now one of the main railway lines in northern England.
    - Designed by the notable railway engineer Alfred Stanistreet Jee.
- Architectural interest:
    - The bridge is well-detailed with ashlar impost bands and string course, and pilasters and voussoirs with tooled margins, that lift its design above the purely functional.
- Group value:
    - With the other listed structures designed by Jee on the Huddersfield & Manchester Railway line.

5.2.9 Roughtown Road Overbridge (MVL3/17) is of significance as a largely unaltered example of an 1840s overbridge, dating from the Heroic Age (1841–50) of railway building and the period of 'railway mania' which marked a time of commercial confidence and expansion in the railways. The bridge's direct historic relationship with historic railway companies of the period, comprising the Huddersfield & Manchester Railway and LNWR, and the notable railway engineer A. S. Jee, who also designed similar structures along the route, give the structure historical value from which it derives significance. The bridge remains in use as a part of the operational railway network and, together with surviving contemporary structures, evidences the historic infrastructure of the Huddersfield & Manchester Railway.

5.2.10 Roughtown Road Overbridge (MVL3/17) derives significance from the quality of its architecture and construction, a characteristic feature of Jee's work for the Huddersfield & Manchester Railway. Architectural elements such as the ashlar impost bands and string course, tooled margins on the pilasters voussoirs and the quality of workmanship across the structure are notable features of Jee's design which elevates the structure above the purely functional. The design language adopted by A.S. Jee was used across a number of other overbridges built along this section of the Huddersfield &

Manchester railway, which further contributes to the understanding of the group value of these related structures. The bridge survives in its original form, with limited evidence of intervention or alteration, and remains in use for its original purpose. The structure continues to reveal Jee's original design intent which is a strong contributing factor to its significance.

5.2.11 The setting of Roughtown Road Overbridge (MVL3/17) makes a minor contribution to its overall significance. Its relationship with the railway is a key component of its setting given that the overbridge continues to span the operational railway and therefore retains its close physical and integral part of the Transpennine railway. The historic integrity of its setting can be appreciated from views of the bridge deck which evidence its relationship with the railway and the wider setting looking out towards Roughtown and Woodend Mill. Views of the bridge can be appreciated from the footbridges to its northeast and south west, which also capture views of the bridge in the context of its wider setting. The contribution that setting makes towards the significance of the underbridge is minor.

Group value

5.2.12 As identified in the list description, Roughtown Road Overbridge (MVL3/17) is recognised to be of group value with other listed structures by A.S. Jee on the Huddersfield & Manchester Railway[1]. These comprise:

- Heyrod Hall Footbridge (MVL3/7) (grade II listed, NHLE 1449242);
- Springbank Lane Footbridge (MVL3/8) (grade II listed, NHLE 1452382);
- Springbank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (grade II listed, NHLE 1452392);
- Wrights Mill Overbridge (MVL3/20) (grade II listed, NHLE 1452406);
- Wright's Overbridge (MVL3/23) (grade II listed, NHLE 1452409);

[1] Wheatley's Overbridge (MVL3/103) (grade II listed NHLE 1450537) was designed by A.S. Jee for the Huddersfield & Manchester Railway. Consent was granted for extensive change to the overbridge as part of the Huddersfield to Westtown (Dewsbury) Order section of the Transpennine Route Upgrade. The overbridge will be demolished and replaced with a new structure (ref 2021/91337). This is likely to result in de-listing. As such its contribution to group value has therefore been excluded from this assessment.

- Royal George Underbridge (MVL3/25) (grade II listed, NHLE 1451848);
- Shaw Hall Bank Road Footway (MVL3/26) (grade II listed, NHLE 1451852);
- Oldham Road Overbridge (MVL3/28) (grade II listed, NHLE 1451853);
- Wickens Underbridge (MVL3/29) (grade II listed, NHLE 1451854);
- Saddleworth Viaduct (MVL3/31) (grade II listed, NHLE 1068120);
- Slaithwaite Viaduct (MVL3/61) (grade II listed, NHLE 1224049);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);
- Milne Viaduct (MVL3/76) (Longwood Viaduct) (grade II listed, NHLE 1220121);
- Church Street (MVL3/82) (grade II listed, NHLE 1452083);
- Huddersfield Viaduct (MVL3/92) (grade II listed, NHLE 123531).
- Hillhouse Lane Underbridge (MVL3/94) (Willow Lane East) (grade II listed, NHLE 1432641); and
- B6118 Colne Bridge Road Overbridge (MVL3/107) (grade II listed, NHLE 1450265). [2]

5.2.13 Of these bridges, four are of particularly similar form to Roughtown Road Overbridge (MVL3/17), comprising segmental arched bridges of stone construction, which are similarly detailed architecturally, These overbridges comprise:

- Heyrod Hall Overbridge (MVL3/7) (grade II listed, NHLE 1449242);
- Spring Bank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Wrights Mill Overbridge (MVL3/20) (grade II listed, NHLE 1452406); and
- Wrights Bridge Overbridge (MVL3/23) (grade II listed, NHLE 1452409);

5.2.14 The group value which Roughtown Road Overbridge (MVL3/17) derives from these relationships provides an understanding of the

[2] B6118 Colne Bridge Road Overbridge (MVL3/107)) (grade II, NHLE 1450265) will be partially demolished and rebuilt with a supplementary structure replacing its spans over the railway. Listed building consent has been granted for this considerable intervention (ref: 2021/91330), and as a result may limit the contribution that this bridge makes towards the group value with the Jee bridges.

wider trends and engineering achievement which characterise both the Huddersfield & Manchester Railway and the Heroic Age of railway building (1841–50) more generally. This group value is enhanced by the structures continuing to form part of the operational railway; as a collective group of assets, they are experienced by those following the rail line (traveling on it, or near it) as coherent features of a single historic route.

5.2.15 Masonry railway bridges across the historic Huddersfield & Manchester Railway route have been characterised as being of local or regional interest, depending on their architectural quality, contribution to wider historical interest of the route, and their group value. It has been noted however that, as a group, they are not of substantial national interest due to their dating from a period of railway development when thousands of similar structures were erected (Alan Baxter Associates, 2019).

5.3 Surrounding heritage assets

5.3.1 The location of the designated and non-designated heritage assets discussed below are shown in Appendix A.

Designated heritage assets

5.3.2 There are eight listed buildings within the 250m buffer of Roughtown Road Overbridge (MVL3/17). These comprise:

- Woodend Toll Bar Cottage (grade II, NHLE 1068038), a former tollhouse cottage dating to the early 19th century located c. 70m to the south-east.
- Summerhill Cottage (grade II, NHLE 1068042), a mid-18th century vernacular two-storey house located c. 60m to the north-west.
- 32 and 34 Greenhill Cottages (grade II, NHLE 1356440), a late 18th century vernacular house located c. 80m to the north.
- Church of St John the Baptist (grade II, NHLE 1356439), a gothic revival stone church dating from 1878-9 by Wild and Collins, located c.190m to the north-west.
- 1 Quickwood (grade II, NHLE 1162836). an early 19th century school master's house located c. 195m north-west.
- Garden Wall to Numbers 3, 4, and 5 and 6 Manor House (grade II, NHLE 1068041), a former Manor House of 17th and 19th century date, located 185m to the north-west.

- 7-17 Quickwood 2 Quickwood (grade II, NHLE 1309435), seven cottages dating from 18th to early 19th century, located c.160m to the north-west.
- Woodend Mill (grade II, NHLE 1268030), a cotton mill of 1838-1840,located c.210m to the south.

5.3.3 Woodend Toll Bar Cottage (grade II, NHLE 1068038), and the spire of the Church of St John the Baptist (grade II, NHLE 1356439) maintain some intervisibility with Roughtown Road Overbridge (MVL3/17). That being said, they do not maintain any meaningful historic relationship and make very little contribution to each other's significance and setting.

Non-designated heritage assets

5.3.4 The Greater Manchester Historic Environment Record (HER) records 18 non-designated heritage assets within 250 m of Roughtown Road Overbridge (MVL3/17), eight of which duplicate the listed buildings identified in paragraph 5.3.2 above.

5.3.5 The remaining ten assets comprise the following:

- Roughtown Mill (site of) (5387.1.0) is located 220 m north-east of the overbridge. First established in 1786, the mill is now demolished and the site has since been redeveloped.
- Andrew Mill (site of) (6337.1.0) is located 180 m north-east of the overbridge. Andrew Mill was a former fulling mill from 1765-1871 and a cotton spinning mill from 1805-1960. The mill is no longer extant.
- Stamford Mill (site of) (6341.1.0) is located 200 m south-east of the overbridge. The mill operated from 1860-61 to 1959 and is now demolished.
- St Johns School (Former) (17907.1.0) is located c. 225 m to the north west of the overbridge. Originally built as 'Roughtown School' in 1885 by James Heywood Whitehead, it was renamed St John's School in 1878. A fire in 1912 resulted in its reconstruction with additional spaces and before closing as a school in 1979. The structure remains extant and in use as a community centre.
- Drill Hall (Former) (17912.1.0) is located c. 150 m to the southwest of the overbridge. It was established in 1912 for gatherings for companies to the Duke of Wellington's Territorial West Riding Regiment. A shooting range was located in basement and hall on the top floor. It is now used by the Tameside Sports Association.

- Roughtown Green (17913.1.0) is located c. 113 m to the west of the overbridge and consist of a small park located on a steep hillside, with mature trees and playground areas.
- Methodist School (former) (17914.1.0) is location c. 124 m northwest of the overbridge. The structure was built in 1866 with stone and lightly coloured brick and slate roof. The structure remains extant and in use by an organ works.
- Roughtown Tavern (former) (17916.1.0) is located c. 155 m to the north-east of the overbridge. It consists of a former stone built, two storey with basement beerhouse with slate roof. The structure has since been converted two private residences.
- Newearth Footbridge (MVL3/16) is located c. 185 m to the south-west of the overbridge. The footbridge with riveted wrought iron girders and masonry abutments was built in 1884 by LNWR and had replaced a former stone segmental overbridge built for and contemporary with the Huddersfield & Manchester Railway.
- Roughtown Road Footbridge (MVL3/18) is located c. 65 m to the north of the overbridge. The footbridge consists of riveted wrought iron girders with cross braced panels. It was built in 1896 by LNWR and had replaced a former stone segmental overbridge built for and contemporary with the Huddersfield & Manchester Railway.

5.3.6 A number of these non-designated heritage assets are no longer extant and their significance now primarily derives from their archaeological remains. As such, these assets do not contribute towards the significance or setting of Roughtown Road Overbridge (MVL3/17).

5.3.7 The remaining offline extant non-designated assets do not share any meaningful visual or historic relationship with Roughtown Road Overbridge (MVL3/17) and therefore do not contribute towards the overbridges' overall setting or significance.

5.3.8 Newearth Footbridge (MVL3/16) (c.180m south-west of Manchester Road Overbridge) and Roughtown Road Footbridge (MVL3/18) (c. 70m north-east of Manchester Road Overbridge) are both historic railway structures which are online and form part of the historic significance of the railway. Both footbridge spans were rebuilt in wrought iron by LNWR in 1884 and 1896 to replace the original masonry arch spans. This contributes towards understanding the late 19th century works and change in ownership to the railway line. Both footbridges are in proximity to Roughtown Road Overbridge (MVL3/17) and they maintain intervisibility with each other. As such, they contribute towards the setting of Roughtown Road Overbridge

(MVL3/17) given that they maintain legibility of the historic railway and its infrastructure and contribute towards its setting.

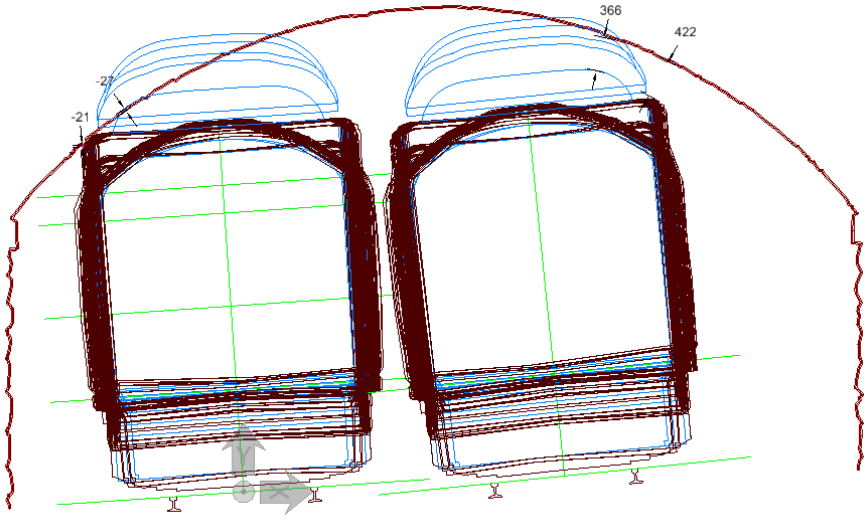
6. PROPOSALS

6.1 Background to proposals

6.1.1 In order to achieve the TRU programme objectives of improving journey times, capacity, overall reliability and resilience, and delivering environmental benefits, the electrification of the railway line and achievement of increased line speed is required. This necessitates the installation of overhead lines along Route Section W2B.

6.1.2 Inadequate clearances to safely install OLE has been recognised as a challenge across much of the TRU, preventing the installation of overhead lines below some existing overbridges. To reduce the requirement for intervention into structures along the route as far as possible, a scheme-specific pantograph has been developed which enabled the use of reduced overhead line wire height under structures, subject to a site-specific risk assessment. A number of structures along the route also do not provide adequate gauge clearance for the required freight trains on the route, the requirement for which has been considered as part of the design development process.

6.1.3 Insert 6-1 shows that even with use of the scheme-specific pantograph, there would still be significant clash between OLE and Roughtown Road Overbridge (MVL3/17). Similarly, the bridge does not have the required freight gauge clearance. A process of design optioneering to identify the optimal solution has been undertaken.



Insert 6-1 Drawing showing the clash between existing structure and proposed pantograph level for Roughtown Road Overbridge (MVL3/17)

6.2 Design development and justification

6.2.1 Design development for Roughtown Road Overbridge (MVL3/17) has taken into consideration a number of factors including the significance of the listed structure, operational requirements and constructability. The design development process has also involved engagement with Historic England and TMBC (as detailed above in Section 4). The iterative and robust process ensures the rigorous exploration of available options, incorporating multi-disciplinary review and ongoing engagement with the heritage consultees.

6.2.2 Based on Network Rail's extensive experience delivering comparable schemes, four options were identified for further consideration. As introduced in Section 6.1, the option of retaining the structure without undertaking any works would prevent the delivery of the Order Scheme. This option was therefore discounted at an early stage. The remaining four options comprised:

1. Track slewing and parapet raising – realignment of the railway track and raising of the parapet to meet Network Rail safety standards.

2. Track lower – Lowering the height of the track to achieve the required headroom while retaining the existing bridge.

3. Bridge Jacking - Increasing the height of the bridge through structurally lifting the arch barrel up from the abutments. This would require diagonal cuts to be made to separate the arch barrel from the abutments, lifting of the arch, infilling of the resulting gaps and refacing.

4. Bridge Reconstruction – Removal of the bridge deck, alterations of the abutments and replacement with a deck providing sufficient clearance.

6.2.3 A summary of the optioneering undertaken for these options is summarised in Table 6-1.

Table 6-1 Optioneering Summary

Option	Key Constraints	Advantages	Disadvantages	Preferred
1) Track slewing and parapet raising	• Sufficient clearance needs to be achieved to enable electrification of the line and allow freight gauge clearance. • Time required working within the railway corridor is required to be minimised as far as possible to reduce risk to construction staff and the length of line possession (closure of the railway) and resulting disruption to railway service. • The bridge spans a railway cutting and is accessible from the highway network only via Roughtown Road. This restricts the accessibility of construction vehicles and the delivery of materials/components getting to the site. • The designation of the bridge as a grade II listed structure places a requirement on Network Rail to have special regard for its preservation under the Planning (Listed Buildings & Conservation Areas) Act 1990.	• Slewing the track would enable the retention of the listed bridge with raising of the parapets undertaken to prevent access to OLE. • This would not require any significant alterations to the grade II listed structure, enabling its retention in substantially its current form. • Minimising overall cost of the proposed works.	• The existing track would need to be renewed for it to be slewed which would result in line possession times, disruption to the railway and disruption of the road. • The parapet extension would result in the loss of the existing stone copers.	**Y**
2) Track Lower		• Lowering of the track would enable retention of the listed bridge with raising of the parapets undertaken prevent access to OLE.	• Underpinning of the bridge and stabilisation of the retaining wall would be required due to the shallow dept of their foundations. Underpinning may present risks to the listed building due to changes to the structural performance of the historic structure. • These interventions would require lengthy line possession to remove the rock, underpin the bridge and stabilise the retaining walls. This would result in significant disruption to the railway and incur considerable public expenditure.	N
3) Bridge Jacking		• This option would enable the retention of the listed bridge. The abutments, deck and parapet would be retained, although in altered form.	• Bridge jacking for masonry arch bridges is a relatively untested methodology, having been delivered on very few historic structures to date. The feasibility jacking masonry arch structures relies on optimal site conditions, where a high level of control can be achieved and long timescales allowed for implementation. The long-term viability of this option is currently unknown. • Bridge jacking would incur extensive disruption to railway users, requiring all works be delivered on site and little scope for off-site construction. • The location of the bridge over a cutting with limited access has significant limitations for execution of a bridge jacking operation. • Jacking of the bridge would raise the level of the road across the bridge, increasing the steepness of the fall to the east along with re-grading of access road approaches. • Raising of the bridge arch would impact the form and appearance of the structure, interrupting architectural features such as the stringcourse and the stone coursing pattern across the parapets, detracting from its architectural value and integrity.	N
4) Bridge Reconstruction		• Reconstruction of the bridge would enable the preservation of some elements of the historic structure, through the retention and reuse of the bridge abutments in conjunction with the new bridge deck. • Historic masonry can be reclaimed from removal of the bridge arch and parapets and reused on the reconstructed structure, aiding integration of historic and modern fabric and reduce visual impact of the reconstruction works. • Reconstruction of the bridge can be delivered substantially from track level. This would minimise the need for construction access by road at this constrained site. • The installation of a preconstructed deck would minimise railway possession time and disruption to the railway network.	• Reconstruction of the bridge would result in the loss of the bridge arch and a portion of the parapets and abutments. This would result in the removal of a significant proportion of the historic bridge, substantially altering its form and appearance, and negatively impacting the integrity of the structure.	N

6.2.4 The preferred option of track slewing and increasing the parapet height (option 1) was determined in early discussions on the overbridge. This option was deemed to be deliverable in terms of cost and constructability and would have minimal impact on the significance of the grade II overbridge. Given that this is achievable for Roughtown Road Overbridge (MVL3/17), this option was progressed to detailed design and the other options 2 to 4 presented in Table 6-1 were not investigated further.

6.3 Development of Preferred Option – track slewing and increasing parapet raising

6.3.1 Design development was subsequently undertaken to mitigate the potential impact of the electrification of the line on the heritage significance of the structure as far as reasonably practicable. The retention of the existing structure requires works to ensure it complies with Network Rail safety standards for bridges over electrified railway lines.

Electrical protection works

6.3.2 A key factor considered throughout the design process is the required compliance with health, and safety standards and security requirements. The existing flat form of the copers on Roughtown Road Overbridge (MVL3/17) present a security risk due to the potential for sitting or walking along them. It is therefore necessary to replace these with anti-sitting steeple copers to prevent access along the top of the bridge parapets. This proposed alteration in turn triggers the need to comply with Network Rail safety standards for bridges crossing an electrified railway which require a minimum clearance to be achieved to reduce the risk of members of the public coming in to contact with live electrical equipment. Where these minimum clearances are not met, as is the case at Roughtown Road Overbridge (MVL3/17), alterations to achieve a minimum parapet height are required.

6.3.3 The current height of the parapets falls below the minimum height requirement for parapets over an electrified railway line as required by NR/L3/CIV/020. This Network Rail standard has its basis in ensuring safety on the railway delivering adequate protection for users and the public in line with the Health and Safety legislation and Building Regulations. The minimum parapet height required for bridges over an electrified line is generally 1.5 m; however, justification must be given that a height of 1.8m cannot be achieved whilst taking into account the risk profile of the bridge.

6.3.4 The risk assessment undertaken for Roughtown Road Overbridge (MVL3/17) identified the vehicular and pedestrian/cycle overbridge

to be of 'low risk' with respect to security and contact with the public. Based on this assessment and in recognition of the need to retain the significance of the listed structure as far as possible, it has been determined that the minimum parapet height required for the structure is 1.55 m, allowing 50 mm tolerance for future resurfacing of the bridge deck.

6.3.5 To meet this requirement it was identified that the existing 200 mm high copers would be removed and replaced with 525 mm high steeple copers. The proposed replacement copers would satisfy the minimum required parapet height and ensure their shape complies with Network Rail standards. The use of copers of consistent size would ensure a coherent appearance in keeping with the architectural character of the bridge. Due to the varying height of the existing parapets, the finished height of the proposed copers would vary across the structure and in places would exceed the minimum required height of 1.55 m. However, limiting the parapet raise to minimum permissible height while introducing a compliant coping stone shape would require intervention into the fabric of the parapets below the copers, resulting in greater impact to the historic fabric of the bridge. It was therefore determined that exceeding the minimum parapet height of 1.55 m is justified.

6.3.6 Optioneering was undertaken to determine the type of material to be used for the parapet raising. Three options were considered to try to limit changes to the structure's historic fabric and impacts on its architectural interest. The options considered are summarised in Table 6-2 Parapet Extension Material below

Table 6-2 Parapet Extension Material

Option	Advantages	Disadvantages	Indicative image	Preferred
Option 1 – Natural Stone	• Natural stone would be sympathetic to the historic character of Roughtown Road Overbridge (MVL3/17), in keeping with its architectural interest. • Natural stone copers would represent an honest intervention, with the form of the stones readable as a response to the electrification challenge, while sympathetically integrating with the existing and historic character of the bridge. • Over time, this material would weather to further integrate with the existing masonry elements Roughtown Road Overbridge (MVL3/17).	• Natural stone is the heaviest of the three options with a density of 25kN/m3. The use of stone would result in unacceptable loading of the historic parapets and bridge structure, resulting is risks to the structural integrity of the bridge. • The weight of natural stone also requires special consideration be given to manual handling safety protocols. • This option is determined to be the most expensive of the three options due to costs for quarrying and fees for masonry contractors.		N
Option 2 – Coloured Concrete	• Lighter material than natural stone with a density of 18 kN/m3, reducing loading on the retained parapets and structure. • Concrete can be coloured to achieve a close visual match to the adjacent masonry coping stones • This material would weather over time, increasing the similarity in appearance between coloured concrete and the existing masonry • Coloured concrete copers would be relatively cost effective, reducing the cost of this publicly funded project.	• Introduction of modern material into listed structure. While relatively sympathetic this material would risk negatively impacting on the architectural interest of the Roughtown Road Overbridge (MVL3/17).		Y
Option 3 – Glass Reinforced Plastic	• Lighter material than natural stone, reducing loading on bridge and parapets. • Cost effective material, reducing the cost of this publicly funded project.	• There would be a stark visual disparity between the GRP copers and historic fabric, detracting from the architectural interest of Roughtown Road Overbridge (MVL3/17). • GRP copers would not weather or soften in the way natural stone or concrete would, with the difference in material continuing to detract from the character of the historic bridge. • Of the options considered, GRP copers would result in the highest level of harm to the character of the bridge		N

6.3.7 Whilst it is recognised that the use of natural stone coping stones would provide the most sympathetic design solution for Roughtown Road Overbridge (MVL3/17), natural stone is significantly heavier than light-weight concrete (25kN/m3 vs 18kN/m3) and would result in unacceptable loading of the structure and parapets, with potential for adverse impacts to the structural integrity of the bridge. Option 2 lightweight coloured concrete, was therefore identified as the preferred option for the coping stones.

OLE

6.3.8 The design development process included optioneering to determine the type of OLE to be used at this location. Two OLE options were considered feasible. The potential impact of these options on the significance of the listed overbridge was considered, with each option resulting in distinctly different impacts on historic fabric and the appearance and setting of Roughtown Road Overbridge (MVL3/17). These options comprised

- Siting twin track cantilevers either side of the bridge.
- Attaching an OLE bridge arm to the bridge soffit.

6.3.9 Table 6-3 below summarises the assessment of these options and their potential impact on the significance of Roughtown Road Overbridge (MVL3/17)

Table 6-3 OLE attachment optioneering

Option	Advantages	Disadvantages	Indicative image	Preferred
1 – Bridge arm	• Visually discrete, reducing the clutter of OLE and minimising the prominence of the equipment in the setting of Manchester Road Overbridge (MVL3/17).	• Requires the minor physical alteration of the listed structure, entailing the attachment of the bridge arm to the underside of the bridge.		**Y**
2 – Twin track cantilever	• Avoids intrusive works to the listed bridge, cables would be free-running beneath the bridge. • Inherently reversible with very minor intervention into the listed structure.	• Introduces visually intrusive features in the immediate setting of Manchester Road Overbridge (MVL3/17). • Reduces the degree to which the architectural interest of the bridge could be appreciated.		N

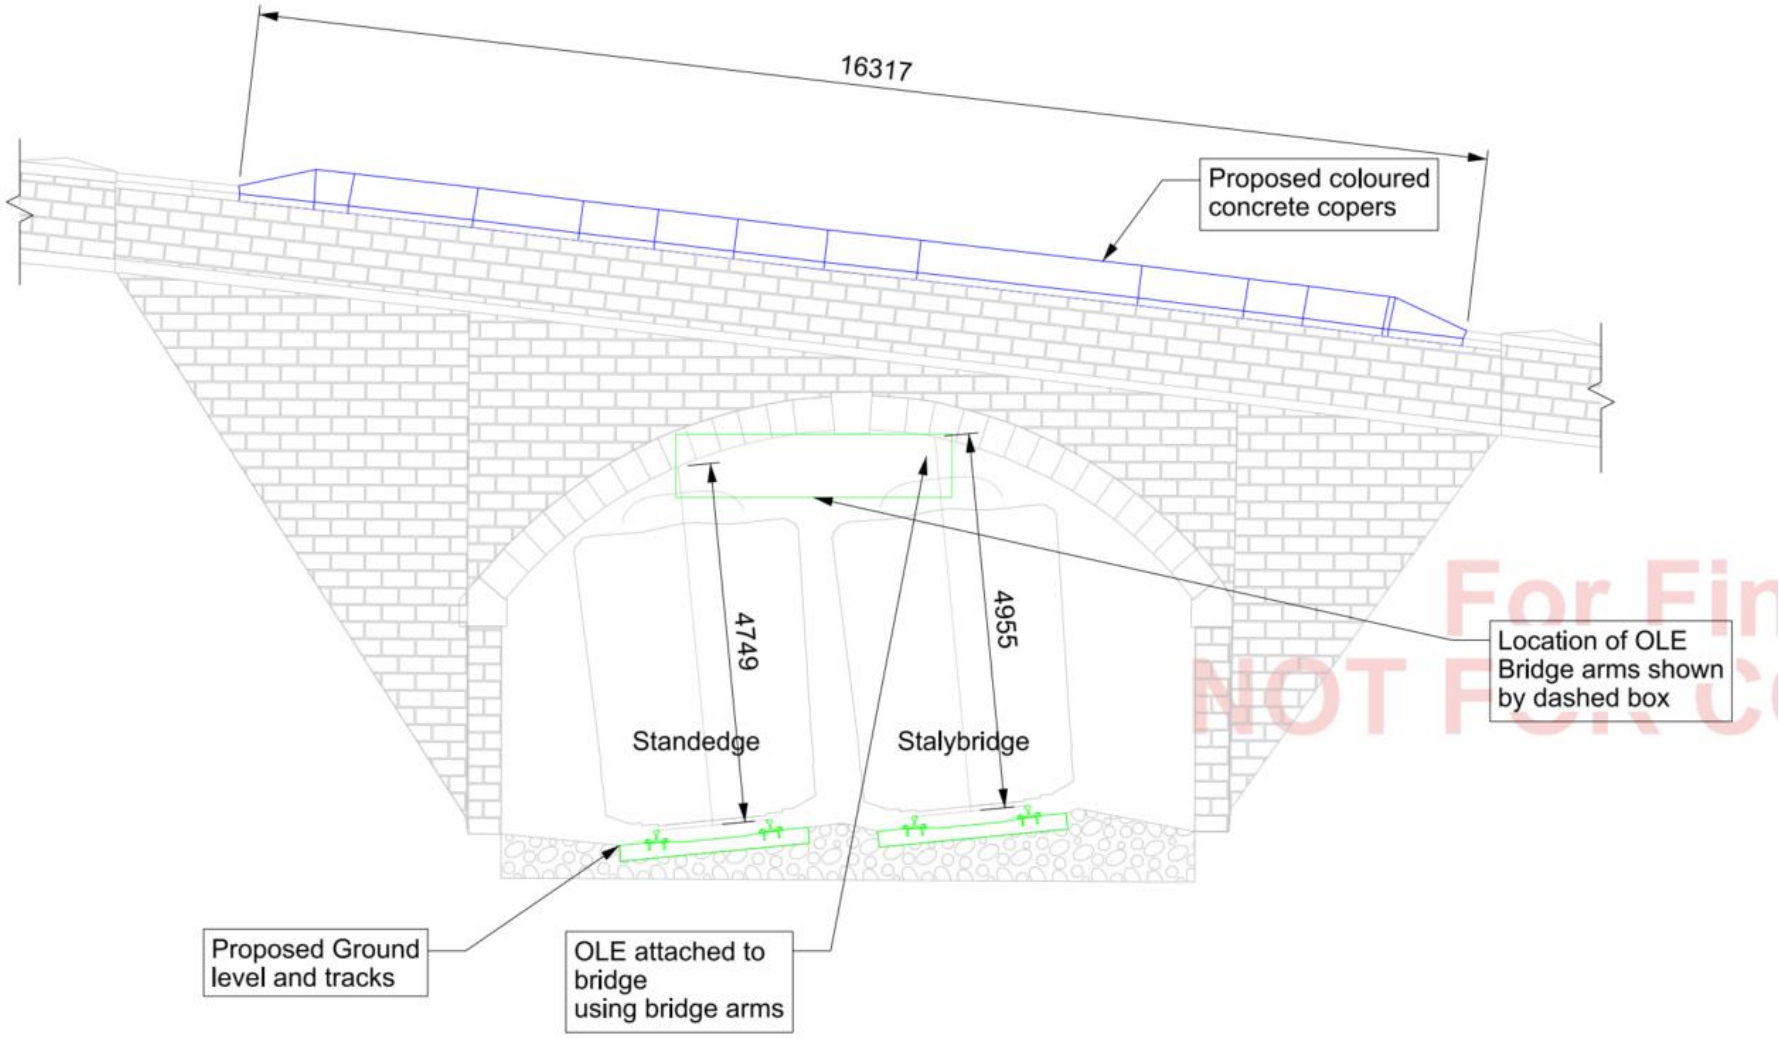
6.3.10 Option 2 (twin track cantilever) would require installation of flashover strips and positioning of the masts in front of both elevations of the bridge, which were as considered to have a greater impact on the significance of Roughtown Road Overbridge (MVL3/17) as this would obscure views of the historic bridge arch. Option 1 (bridge arm) would remove the requirement for the masts. Balancing the minor impact on historic fabric arising from fixing the bracket to the underside of the bridge against the benefits of minimising visual intrusion of OLE on the significance of the bridge, Option 2 (twin track cantilever) was identified as the preferred approach.

6.4 Description of proposals

6.4.1 The track slew under Roughtown Road Overbridge (MVL3/17) would enable the retention of the overbridge in a largely unaltered state. Works are nevertheless required to the bridge to facilitate the electrification of the railway in a manner that complies with the required safety standard for a structure over an electrified line (Insert 6-2 to Insert 6-4).

6.4.2 The alterations would comprise:

- Removal of the existing stone copers.
- Installation of lightweight coloured concrete steeple copers 525 mm tall into the existing stone parapets using stainless steel dowels 250 mm long and 16 mm in diameter to exceed the minimum required parapet height of 1.55 m and achieve the required sloped profile.
- Attachment of an OLE to the underside of the arch barrel using bridge arms.
- Installation of two electrification warning signs on each parapet.



Insert 6-2 Proposed elevation Roughtown Road Overbridge (MVL3/17)

Insert 6-3 Visualisation of Roughtown Road Overbridge (MVL3/17) looking north along the overbridge.

Insert 6-4 Visualisation of Roughtown Road Overbridge (MVL3/17) looking south along the overbridge

Construction Methodology

6.4.3 The proposed works at Roughtown Road Overbridge (MVL3/17) comprise:

- Remove existing copers using on road plant.
- Drill holes into the existing parapet.
- Land copers with cast-in dowls, from the road using lifting straps, into the dowel holes and onto shims.
- Flood grout between copers including the dowel holes.

- Attachment of two electrification warning signs to the interior of each parapet.
- Insertion of resin anchors into the arch barrel for OLE bridge arm attachment.

6.4.4 The proposed works to Roughtown Road Overbridge (MVL3/17) are shown in the following drawings which accompany this application:

- Existing and proposed Plan (167037-TGP-25-MVL3-DRG-T-LP-161702).
- Existing and proposed Elevation and Section (167037-TGP-25-MVL3-DRG-T-LP-161703).

7. IMPACT OF PROPOSALS

7.1 Roughtown Road Overbridge (MVL3/17)

7.1.1 The proposed works to grade II listed Roughtown Road Overbridge (MVL3/17) are required to accommodate electrification of the railway line as part of the wider TRU programme. These works would result in minor alteration of the structure comprising addition of light-weight concrete steeple copers and attachment of OLE bracket to the bridge.

7.1.2 The addition of steeple copers to the parapets would alter the appearance of the bridge, raising the height of the parapets by 325 mm, and would be legible as a sensitive alteration of the structure. Although replacement of the existing coping stones with concrete steeple copers would constitute a permanent change to Roughtown Road Overbridge (MVL3/17), the extent of intervention into historic fabric would be limited to the removal of the existing copers and dowelling through the stone parapet to secure the new steeple copers. Whilst the use of lightweight coloured concrete would introduce a modern material into the historic structure, its visual impact would be mitigated as far as possible by carefully colour matching the historic fabric.

7.1.3 The introduction of the new OLE bridge arm would have a localised physical impact on the fabric of the bridge, limited to the soffit of the overbridge. The OLE bridge arm would be visible from the railway line but would not be visible from the bridge deck or adjacent road due to its placement in the centre of the arch soffit. This would have no visual impact on views of the bridge from the adjacent highway.

7.1.4 Whilst resulting in minor alteration of Roughtown Road Overbridge (MVL3/17), these works would have a limited impact on the significance of the structure. The form of the bridge's arched span and wing walls would be maintained, as would architectural features

such as the stringcourse and pilasters, and quality of detailing and construction, which are key aspects of the asset's significance.

7.1.5 The group value of the structure with other bridges designed by A.S. Jee for the Huddersfield and Manchester Railway would be maintained. Whilst the raising of the parapets would result in change to the appearance of the bridge, A. S. Jee's original design would continue to be understood, maintaining the group value of the structure with other Jee designed bridges along the Transpennine route. The alteration of the parapets would be understood as a sensitive alteration required to enable modernisation of the railway line through its electrification, and part of the ongoing use and modernisation of the historic railway network.

7.1.6 These proposals would therefore result in less than substantial harm to the significance of Roughtown Road Overbridge (MVL3/17).

7.2 Other heritage assets

7.2.1 Due to the minor nature of the proposed works, these would not result in any impacts to the surrounding designated or non-designated heritage assets.

7.3 Mitigation

7.3.1 The design proposals for Roughtown Road Overbridge (MVL3/17) have been developed to minimise impacts on the fabric, form and appearance of the overbridge. This has been achieved through a robust process of optioneering, undertaken in consultation with Historic England and TMBC. Measures incorporated into the design to mitigate impacts on the significance of the bridge include:

- Colour matching of the concrete copers to minimise their visual impact and aid their integration with the historic bridge fabric.
- Siting of the OLE Bridge Arm in the centre of the arch barrel, minimising its visibility

7.3.2 During construction of the works, toolbox talks to disseminate best practice for reducing potential impacts in relation to construction activity associated with Roughtown Road Overbridge (MVL3/17) would also be delivered, for example to help avoid accidental damage.

Recommended compensation

7.3.3 In addition to these embedded measures, additional mitigation secured through the use of listed building consent conditions is recommended comprising:

- A scheme of historic building recording to Level 1 standards in accordance with Historic England guidance (Historic England, 2017). This would provide a permanent record of Roughtown Road Overbridge (MVL3/17) in its current form and be lodged with the Greater Manchester Historic Environment Record.
- A scheme of permanent heritage interpretation would be developed and installed adjacent to Greenfield Station. This would provide the opportunity to engage members of the public with the heritage of the Huddersfield & Manchester Railway including the historic structures designed by A. S. Jee, such as Roughtown Road Overbridge (MVL3/17). Further engagement with stakeholders with respect to the content of the interpretation would be undertaken during the detailed design phase.

7.4 Public benefit

7.4.1 The works proposed to be undertaken to Roughtown Road Overbridge (MVL3/17) are required to ensure the realisation of the substantial public benefits of the Order Scheme.

7.4.2 As part of the wider TRU Programme, the Order Scheme would directly and indirectly play a role in improving regional connectivity and enhancing of some of Britain's busiest rail network, in turn realising economic, social and environmental objectives of the programme. The Transpennine route is identified as a key transport corridor, providing connections between cities in the North of England. The improvements in connectivity delivered by the TRU programme will support aspirations for economic growth and "levelling up" opportunities across the North of England.

7.4.3 The key objectives of the TRU programme are to achieve the part electrification of the Transpennine Route, improve journey times and capacity between key destinations, improve overall reliability and resilience of the route, and provide environmental benefits from modal shift from road to rail freight reducing the number of heavy vehicles on the highway network and associated air pollution. The proposed works to increase the parapet height at Roughtown Road Overbridge (MVL3/17) would contribute towards this by ensuring the structure is compliant with Network Rail safety standards, thereby delivering increases in line speed, capacity and resilience.

7.4.4 Electrification would deliver faster journey times and improved performance by allowing trains to accelerate faster, and brake more efficiently. The Order Scheme will deliver faster line speeds (80 mph throughout), improving journey times along the Transpennine Route, aiming to provide an improved journey time from Leeds –

Manchester Victoria of 42-43 minutes and York to Manchester Victoria of 65-67 minutes. Works to the track and structures along the Route, including Roughtown Road Overbridge (MVL3/17), are required to accommodate this increase, and without these changes the Scheme would be unable to go ahead.

7.4.5 As a vital constituent part of the Order Scheme, the proposed works to Roughtown Road Overbridge (MVL3/17) would also facilitate indirect benefits associated with the wider programme of works, including station upgrades, track renewal and signalling improvements.

7.4.6 The reliability and resilience of the route and services operating on it will be improved by replacement of existing infrastructure with electrification equipment, new track drainage and signalling. Modern signalling equipment will reduce the headway between trains, allowing them to run closer together which will in turn provide increased capacity. The Scheme will provide the capability to operate four 'express', two 'semi-express' services and up to two local services an hour on the Route and will provide increased flexibility to timetable more train paths.

7.4.7 Electrification of the Scheme would provide substantial environmental and sustainability benefits and is an investment in 'greener' energy technology. This supports Network Rail's Decarbonisation Strategy and is bolstering national targets for reducing harmful emissions that cause climate change, which are set out in Government legislation for achieving net zero carbon by 2050.

7.4.8 The Order Scheme will also deliver improved safety through measures including replacement of two level crossings, installation of additional safety measures on existing bridges; enhancements to the local highway networks and new pedestrian crossing points at locations including Greenfield and Mossley Stations. Accessibility of the railway network will also be improved with the provision of fully accessible stations at Greenfield Station and the relocated Mossley Station. These measures are being brought forward as part of the wider TRU Scheme to electrify and modernise the Route, as facilitated, in part, by the works to Roughtown Road Overbridge (MVL3/17).

7.4.9 Significant residual beneficial effects arising from the operation of the wider TRU Scheme have been previously identified in the Huddersfield-Westtown TWA Order Inquiry from December 2021. These included recognition of improved journey times, reliability, and capacity at the Local Authority area and in turn the sub-regional and regional level. These improvements will bring direct significant

benefits to local businesses and the labour market through improved access to the local regions along the section of the route from Stalybridge to Diggle.

7.4.10 To this effect, the proposals at Roughtown Road Overbridge (MVL3/17) are therefore essential in achieving the overall substantial public benefits of Route Section W2B and wider objectives of the Order Scheme, and without these interventions, the Order Scheme would not be able to be safely and successfully implemented. Alongside these substantial public benefits, the delivery of heritage interpretation adjacent to Greenfield Station would enable public engagement with the heritage of the Huddersfield & Manchester Railway, its architecture significance.

8. CONCLUSION

8.1.1 The significance of Roughtown Road Overbridge (MVL3/17) lies primarily in its historic and architectural interest. The bridge is a largely unaltered example of a masonry underbridge dating to the Heroic Age (1841-1850) of railway building. The high quality of the bridge's architecture, including rusticated voussoirs and carriageway band, together with the quality workmanship of the construction is characteristic of A.S. Jee's work for the Huddersfield & Manchester Railway. The bridge also derives significance from this direct historical relationship with notable railway engineer A.S. Jee and the historic railway companies namely the Huddersfield & Manchester Railway and LNWR. The setting of Roughtown Road Overbridge (MVL3/17) makes a minor contribution to the significance of the structure. It also possesses group value as one of a number of A.S. Jee structures on the Transpennine route which share a common design language.

8.1.2 The proposals for alteration of Roughtown Road Overbridge (MVL3/17) have been developed through a robust optioneering process, undertaken in consultation with Historic England and TMBC, and designed to minimise impact on the significance of the listed building as far as possible. The proposed works would comprise:

- The attachment of lightweight coloured concrete steeple copers to the existing parapet;
- Electrification warning signs installed two per parapet; and
- Attachment of an OLE bridge arm to the arch barrel of the bridge.

8.1.3 These works would result in minor alteration of the structure and would preserve key aspects of its significance including its architectural quality, detailing and construction. Whilst the proposals

would introduce modern materials into the fabric of the structure, these works are limited and would be developed to be as visually unobtrusive as possible. The group value of Roughtown Road Overbridge (MVL3/17) with other bridges designed by A.S. Jee for the Huddersfield and Manchester Railway would be maintained.

8.1.4 The proposals would result in less than substantial harm to the significance of Roughtown Road Overbridge (MVL3/17), as defined under the NPPF and as agreed in the 25 June 2024 pre-application response from Historic England (see Appendix C). These impacts are necessary in order to support the achievement of substantial public benefits related to:

- Improved efficiency and reliability of the railway (in journey time saving and increased capacity);
- Reduction of delays to trains and other highway users (improved efficiency of the railways means fewer heavy vehicles on the highway network causing traffic issues and contributing to air pollution);
- Supporting sustainable transport development in line with Network Rail's Decarbonisation Strategy; and
- Improving public health and safety in providing safe routes across the railway.

8.1.5 In addition to this, the delivery of a programme of heritage interpretation at Greenfield Station would provide the opportunity for engagement of the public with the heritage of the Huddersfield & Manchester Railway.

8.1.6 These substantial public benefits would outweigh the less than substantial harm to the significance of Roughtown Road Overbridge (MVL3/17) as defined in paragraph 215 of NPPF. The proposals would also satisfy the requirements of Policy C5 of the Tameside Unitary Development Plan in relation to the impact on the character of the listed building, and preservation of its architectural style and features. The proposals therefore satisfy both national and local policy requirements in relation to the justification for harm to the significance Roughtown Road Overbridge (MVL3/17).

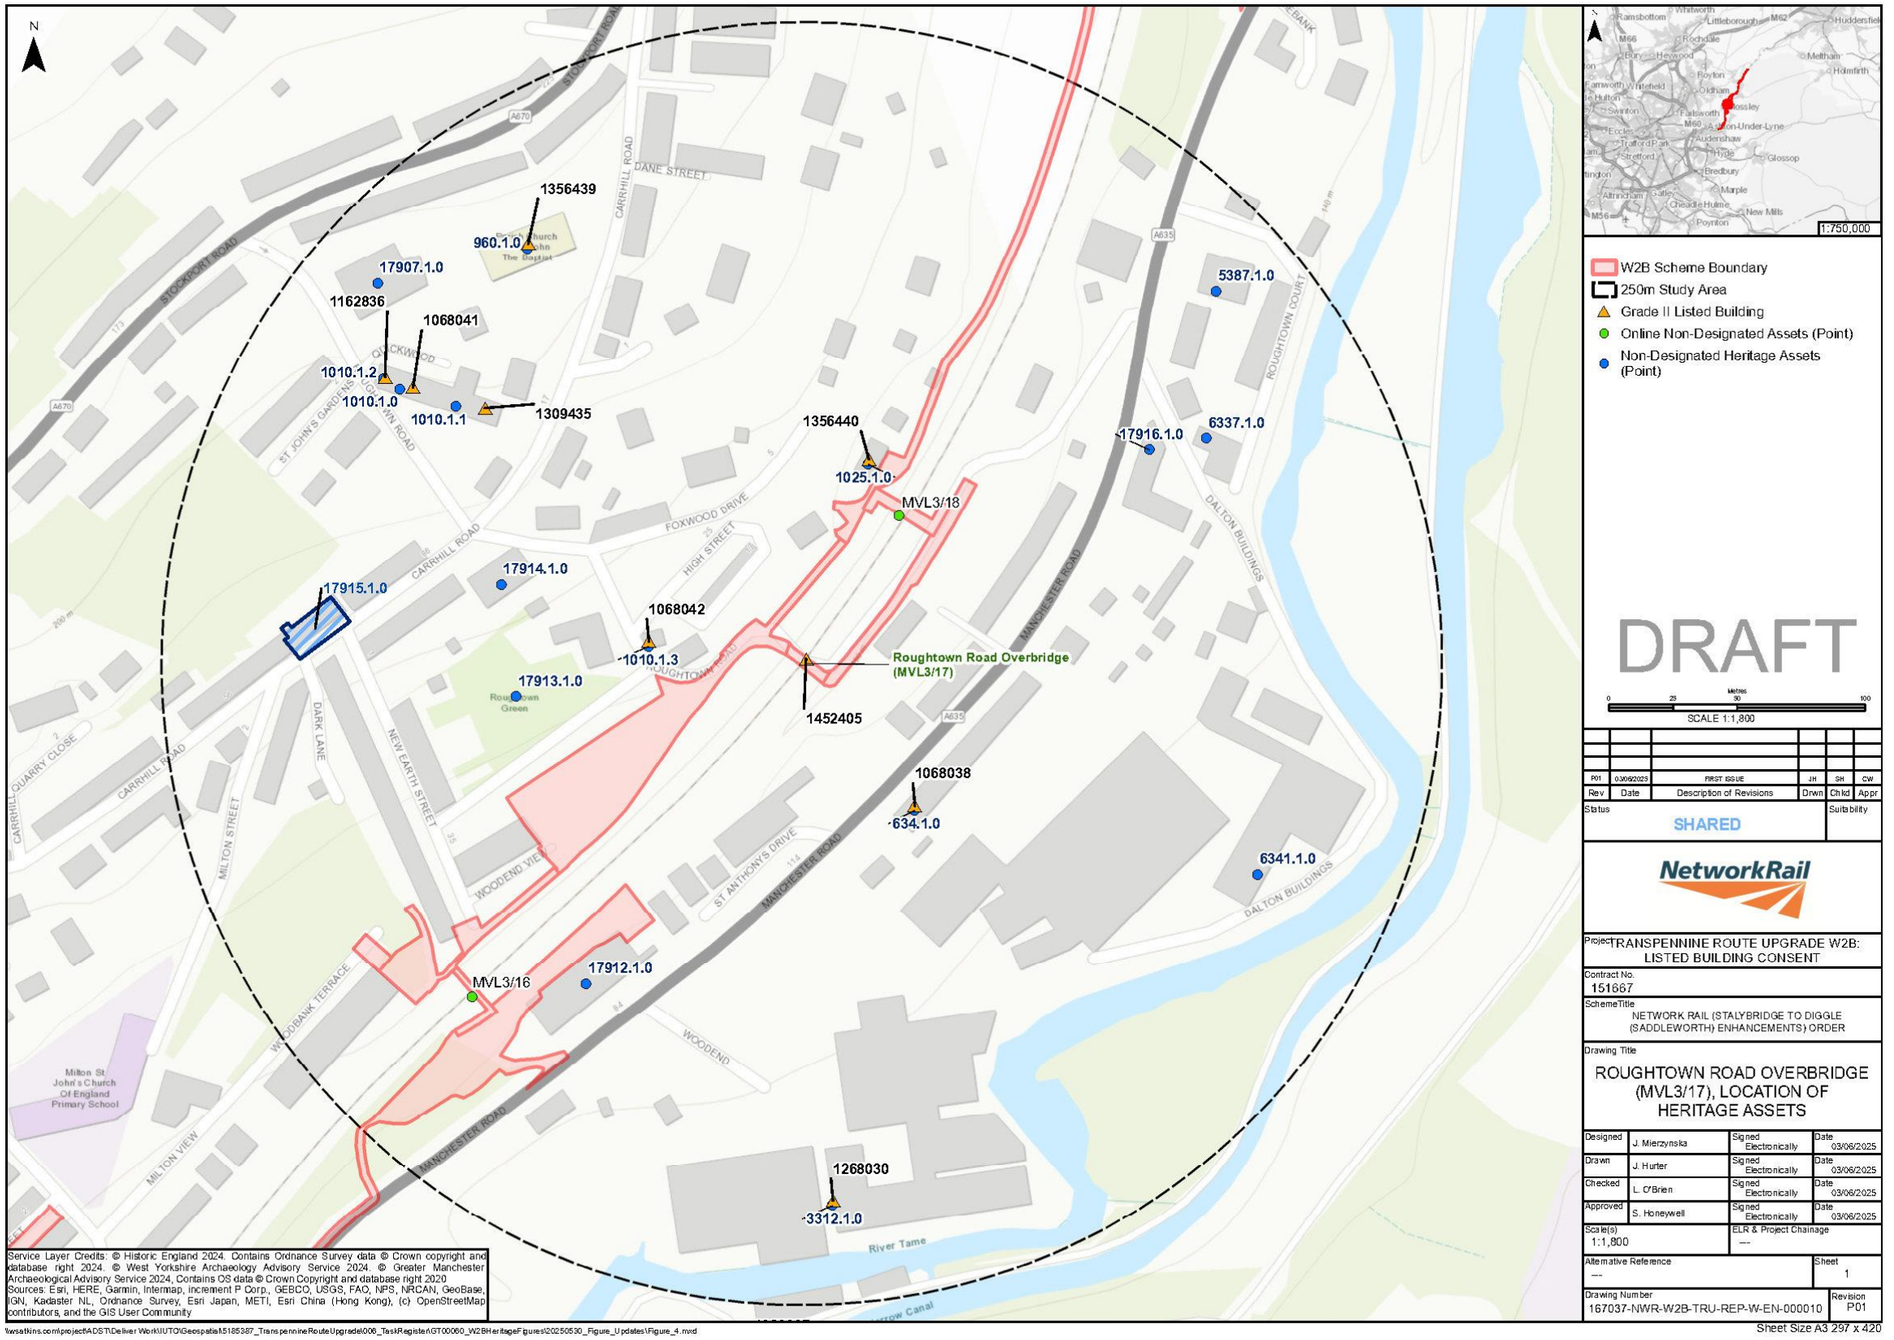
APPENDIX A – LOCATION PLAN



APPENDIX B – NATIONAL HERITAGE LIST DESCRIPTION

Official list entry

Heritage Category:	Listed Building
Grade:	II
List Entry Number:	1452405
Date first listed:	23-Mar-2018
List Entry Name:	Railway overbridge MVL3/17, Roughtown Road
Location Description:	Higher Newtons, Mossley.

Location

The building or site itself may lie within the boundary of more than one authority.

District:	Tameside (Metropolitan Authority)
Parish:	Mossley
National Grid Reference:	SD9772402832

Summary

Railway overbridge, 1845-1849, by AS Jee for the Huddersfield & Manchester railway.

Reasons for Designation

Roughtown Road bridge (MVL3/17), constructed in the mid-late 1840s by AS Jee for the Huddersfield & Manchester Railway, is listed at Grade II for the following principal reasons:

Historic interest:

* constructed during the heroic age of railway building and a little-altered example of an 1840s overbridge on what is now one of the main railway lines in northern England;

* designed by the notable railway engineer Alfred Stanistreet Jee.

Architectural interest:

* the bridge is well-detailed with ashlar impost bands and string course, and piers and voussoirs with tooled margins, that lift its design above the purely functional.

Group value:

* with the other listed structures designed by Jee on the Huddersfield & Manchester Railway line.

History

In contrast to the main trunk lines of the late 1830s that were constructed by single railway companies the route from Stalybridge to Leeds had fragmented origins and was the work of three different railway companies: the Huddersfield & Manchester Railway, Leeds, Dewsbury & Manchester Railway, and the Manchester & Leeds Railway.

The Huddersfield & Manchester Railway was authorised in 1845 and followed the route of the Huddersfield Narrow Canal for much of its length, including a railway tunnel through the Pennine hills set alongside the earlier Standedge Canal Company tunnel of 1811; in 1846 the railway company also acquired the canal. Joseph Locke and Alfred Stanistreet Jee were appointed to survey and design the new line, the two engineers having already worked together on a major project linking Manchester and Sheffield. Jee became the lead engineer for the Huddersfield line, which passed through challenging terrain, assisted by resident engineers that included his brother Moreland Jee (until 1848) and Herbert F Mackworth. Construction of the line was divided into various contracts, with many contractors being only responsible for a single cutting, viaduct or tunnel portal. The largest contract for the Standedge Tunnel between Diggle and Marsden was let to a single contractor, Thomas Nicholson in 1847. The tunnel's completion in 1849 marked the opening of the line.

The Leeds end of the route, which was also authorised in 1845, was constructed by the Leeds, Dewsbury & Manchester Railway. The engineer was Thomas Grainger who had previously largely worked in Scotland, and the line was completed in 1849.

A short three-mile section of the route between Heaton Lodge Junction and Thornhill Junction near Mirfield was developed by the Manchester & Leeds Railway and was constructed in 1837 to 1840, with George Stephenson as the chief engineer. The structures on this line were designed by Thomas Gooch under the oversight of Stephenson. In 1847 the railway company changed its name to the Lancashire & Yorkshire Railway.

In 1847 the Huddersfield & Manchester Railway and the Leeds, Dewsbury & Manchester Railway were acquired by the London & North Western Railway (LNWR) so that the company could access the city of Leeds and the textile towns of West Yorkshire. This pitted them as rivals to the Lancashire & Yorkshire Railway, although at points on the route the two companies had to work together. By 1851 the London & North Western Railway had an overall mileage of railway track of 800 miles and it became the most prominent railway company in the country and the largest joint-stock concern in the world in the late C19. Although the LNWR had a general manager, Captain Mark Huish, the lines of the

Stalybridge to Leeds route still managed their own affairs. LNWR later carried out expansion works, including the widening of tracks and bridges, the construction of additional tunnels, and station alterations. In 1923 the line became part of the London Midland & Scottish Railway, and subsequently part of the nationalised British Railways in 1948. The line, its structures and track are currently (2018) owned by Network Rail, and the passenger services operated by TransPennine Express and Northern Rail.

This overbridge was built to carry Roughtown Road over the railway. It was designed by AS Jee (1816-1858) and dates from the line's construction between 1845 and 1849. It remains as built, apart from minor parapet repairs and deck resurfacing.

Details

Railway overbridge, 1845-1849, by AS Jee for the Huddersfield & Manchester Railway.

MATERIALS: buff sandstone.

DESCRIPTION: the bridge carries Roughtown Road north-south across the railway, to the east of Mossley Station. Due to gradients the deck slopes down towards the south. The bridge comprises a single segmental-arched span recessed between battered abutments to either side of the steep cutting, with a parapet.

The stonework is regular-coursed and quarry-faced. The stone of the arch piers and the voussoirs have tooled margins, the keystone breaking the arch above and below. The impost bands, sloping string course above the arch and the twice-weathered parapet copings are dressed. The abutments curve outwards slightly at all four corners and terminate in slender piers with shallow, pyramidal caps. The arch soffit is narrow-coursed masonry with tooled detailing.

The road surface is tarmac. A short section of parapet copings in the south-west corner has been rendered, and a short cement kerb with modern bollards has been installed next to the inner face of the south-west corner.

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the pre-application meetings over the last five months. These have been extremely useful in explaining the significance of the heritage assets, the design team's approach, and in exploring issues and constraints associated with electrifying the track.

This letter covers our advice regarding proposals for change to eight listed railway structures between Stalybridge and Standedge Tunnel, within the Metropolitan boroughs of Tameside and Oldham in Greater Manchester. This section of the railway is referenced as W2B.

Significance

The section of railway between Stalybridge and Standedge Tunnel was constructed in stages between 1844 and 1849. This was at the height of “railway mania”; an intense period of activity when many competing companies formed and were racing to complete sections of railway. The Stalybridge and Standedge Tunnel railway eventually became part of a wider network of sections of track that extends from Selby and York to Manchester Victoria via Leeds.

The W2B route has considerable heritage value. It traverses areas of dramatic landscape and varied geology, and has remained well preserved and largely unaltered since its opening in the 1840s. The wider railway network from the Yorkshire cities to Manchester contributed hugely to the economic and urban development of the North and was a major factor in the industrial revolution and in the development of towns.

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

The tricky geology and terrain of the W2B route presented challenges to the engineers of the 1840s, and many of the most notable surviving features of the railway are the impressively engineered bridge and viaduct structures. These structures are predominantly built from locally sourced stone, meaning they harmonise with the landscape and contribute to local views, adding to the aesthetic value of the route. The significance of the structures also lies in the fact that they survive well and in large numbers. There have been few alterations to bridges, mainly because this section of the line has not been widened as other parts of the wider route have been.

There are eight listed railway structures that will be affected by the proposed electrification works between Stalybridge and Standedge Tunnel; these are:

- Heyrod Hall Overbridge - MVL3/7
- Heyrod Footbridge Overbridge - MVL3/8
- Spring Bank Lane Overbridge - MVL3/9
- Roughtown Road Overbridge - MVL3/17
- Wright's Mill Overbridge - MVL3/20
- Wright's Overbridge - MVL3/23
- Oldham Road Overbridge - MVL3/28
- Saddleworth Viaduct - MVL3/31

All eight of the listed structures were designed by notable railway engineer Alfred Stanistreet Jee, lead engineer for the railway between Huddersfield and Manchester. They were built in the mid-late 1840s and share many architectural characteristics, adding to their group value and enhancing their significance.

Bridges MVL3/7, MVL3/9, MVL3/17, MVL3/20, MVL3/23, and MVL3/28 are all very similar in design. All are made from coursed local sandstone and have segmental arches formed from tooled voussoirs, with larger keystones. Each has dressed ashlar impost bands, sloping string courses above the arch, and parapet copings, with shallow pyramidal caps to the slender piers. They have considerable group value and are easily identifiable in the landscape as bridges associated with the original construction of the railway. The bridges are all well designed and adapted to their individual locations, some being skewed or sloped. High quality workmanship and

Historic England

details such as picked and tooled ashlar voussoirs elevate their design above what is purely function, enhancing their significance further.

Heyrod Footbridge (MVL3/8) and Saddleworth Viaduct (MVL3/31) are clearly recognisable as part of the same scheme of work but differ in their form. Heyrod Footbridge features a flat span, and retains its cast-iron edge beams and brick parapets, while Saddleworth Viaduct comprises 23 sandstone arches spanning the River Tame and Huddersfield Narrow Canal.

The structures are all Grade II listed in recognition of their special architectural and historic interest at national level. Saddleworth Viaduct was listed in 1986, while all seven overbridges were listed in 2017 or 2018 after a comprehensive review of the line.

Impacts

The proposals involve demolition and reconstruction of three structures, total removal of one structure, and modifications to four structures. These works are deemed necessary to achieve the clearance required for the OLE (overhead line equipment) and to ensure safety for bridge users. The impacts of proposed works at each structure are discussed below.

Bridges requiring demolition works:

Heyrod Hall Overbridge MVL3/7 carries a short section of private road over the railway to Heyrod Hall. This bridge is in a rock cutting with very hard rock beneath the track, prohibiting track lowering.

Wright's Mill Overbridge MVL3/20 carries the public footpath and bridleway over the railway where it passes through a steep-sided rock cutting. Options to lower the track at this bridge have been investigated but discounted due to the location on the bridge in a rock cutting with very hard rock beneath. Track lowering would also have a knock-on effect to a nearby underbridge.

Oldham Road Overbridge MVL3/28 is a skew overbridge located on the north-east side of Greenfield Station and carries Oldham Road over the track below. There will be

SUITES 3.3 AND 3.4 CANADA HOUSE 3 CHEPSTOW STREET MANCHESTER M1 5FW

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

the addition of a new footbridge alongside the reconstructed road bridge. Options to lower the track at this bridge have been investigated but would be difficult to achieve due to the proximity to the station.

Proposals at these three bridges involves the complete dismantling of each bridge and reconstruction to create a raised, flat deck with sufficient clearance for OLE. Stone would be reclaimed and used to clad the inside faces of parapet walls; however matching stone is likely to be needed to clad the external sides of the parapets. New copers would also be needed to ensure parapets were the correct height.

The demolition and reconstruction of these bridges will cause substantial harm to their significance through the total loss of historic form and loss of much of their original fabric. The proposals will also diminish the group value of the historic bridges on the railway.

Wright's Overbridge MVL3/23 is a footbridge that carries a public footpath from north-west to south-east across the railway. The railway here is in a steep cutting and due to gradients, the bridge slopes down towards the south-east. Proposals involve the total removal of this bridge and diversion of the public right of way across the railway at another point.

The removal of Wright's Overbridge will cause substantial harm to its significance through the total loss of its historic form and all original fabric. Its removal will necessitate the re-routing of a historic public footpath, which is part of a network of paths in the area connecting mills and farms with workers' housing, and contributes to the landscape character of the area and to the setting of the bridge. The proposals will also further diminish the group value of the historic bridges on the railway.

Bridges requiring modifications:

Heyrod Footbridge Overbridge MVL3/8 carries a footpath running east-west over the railway, with steps on the eastern side down to a path running south-east towards Spring Bank Lane which are also listed.

Spring Bank Lane Overbridge MVL3/9 (also known as Heyrod Bridge) carries Spring Bank Lane over the railway. Due to the lie of the land the bridge slopes down towards the east. The splayed projecting wing walls are also covered by the listing.

Historic England

Roughtown Road Overbridge MVL3/17 carries Roughtown Road north-south across the railway, to the east of Mossley Station. Due to gradients the deck slopes down towards the south. The projecting wing walls are also covered by the listing.

Minimal interventions are proposed at these three bridges, the most significant changes being the introduction of new triangular copers to ensure the correct and safe parapet heights.

The introduction of triangular copers to raise the parapet heights to 1.5m will result in a low level of less than substantial harm to the significance of the bridges through the changes to their appearance and the loss of original copers. This harm could be further lowed by using stone copers instead of concrete, and by undertaking any other restoration works required such as replacing the recently rendered section of parapet copings in the south-west corner of Roughtown Road Bridge.

Saddleworth Viaduct MVL3/31 (also known as Uppermill Arches and Uppermill Viaduct) carries the railway over a series of roads and lanes, and the River Tame and Huddersfield Narrow Canal. Due to the lack of space available on the viaduct deck, proposals here involve attaching brackets to the exterior of the viaduct for the OLE supports.

The proposed works at Saddleworth Viaduct will result in a low level of less than substantial harm to the significance of the structure through the change to its appearance and in the physical impact on the elevations of the viaduct from the brackets. This harm could be further lowed by ensuring the spacing of the masts responds to the structural and architectural rhythm of the viaduct to lessen their visual impact.

Policy

National policy relating to the conservation and enhancement of the historic environment is articulated in section 16 of the National Planning Policy Framework (NPPF, 2023). These policies state that heritage assets are an irreplaceable resource and should be conserved in a manner appropriate to their significance, so they can be enjoyed for their contribution to the quality of life of existing and future generations (NPPF para 195). Also, when considering the impact of a proposed development, great weight should be given to an asset's conservation (NPPF para 205).

Historic England

Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification (NPPF 206).

Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss. In practice this means that less harmful alternative solutions should be explored through the pre-application and application processes.

In addition to section 16 of the NPPF, we refer you to Section 12 'Achieving well-designed and beautiful places' when considering the design for replacement bridge structures. Para 132 states that being sympathetic to local character and history is important, along with a consistent and high-quality standard of design (para 133).

Position

The proposed works to upgrade the W2B section of the Transpennine route network will be the first major programme of work since its construction in the 1840s. The wider public benefits of the upgrade work to this key transport network will be vast and will have positive knock-on effects across the region. The challenging geology and hydrology across the route still present issues to engineers today, and we welcome the work that has gone into investigating alternative options to demolition and reconstruction for the bridges affected.

The proposals will result in substantial harm to the significance of bridges MVL3/7, MVL3/20, MVL3/23, and MVL3/28, with the highest level of harm to bridge MVL3/23 which will be dismantled and not reconstructed. The proposals will cause harm through the loss of the form of the arched bridges and though the loss of historic fabric. There will be the additional harm to the group value of the bridges.

We agree that the bridges are predominantly experienced from the bridge deck, and that re-use of original fabric should be focussed on the inside faces of the parapet walls to ensure the look of the bridge when crossing it is not unacceptably altered, however this re-use of materials does not lower the harm to less than substantial levels. It will be for decision takers to weigh the balance of this substantial harm against the public benefits of the scheme.

Historic England

Works to bridges MVL3/8, MVL3/9 and MVL3/17 is largely limited to raising the parapets to ensure they are the safe and correct height. We acknowledge that Network Rail has a legal obligation to take reasonable steps to prevent people from coming into contact with the OLE by ensuring parapets cannot be climbed or walked on. We appreciate the work undertaken to investigate various options for different types of pantographs to limit the height at which the parapets need to be raised to. The use of triangular copers will introduce a change in the appearance of the bridges and cause a low level of less than substantial harm to their significance, but the impact can be lessened by use of stone rather than concrete copers which will be less visually obtrusive. Parapet design should be tailored to the individual circumstances of each bridge to ensure the least harmful solution is used.

There will also be a low level of less than substantial harm at Saddleworth Viaduct from the introduction of brackets to the structure to support the OLE. This can be further lowered by thoughtful spacing of the brackets.

We welcome the detailed options appraisals undertaken during the design of the proposed works to listed structures on the W2B route. We recommend that details are finalised using bespoke designs that respond to the particular character of each structure and its setting.

Next Steps

Thank you for involving us at the pre-application stage of this project. The above advice is the response that we would give if the same proposals were put forward unamended for statutory approval.

Yours sincerely

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the meeting on 27 August to review the proposals for bridges MVL3/7, 8, 17 and 20. It was useful to see the drawings in advance and then talk through the proposals with the team.

The significance of the affected structures has been set out in our letter of 25 June 2024 and won't be repeated here. The impacts of the proposed changes and our comments are detailed below:

MVL3/7 - Heyrod Hall Overbridge
The changes to this bridge involve demolition and reconstruction of the bridge deck and sections of the abutments, resulting in substantial harm to the significance of the bridge. The bridge is built from coursed local sandstone, and the voussoirs have been lightly tooled around the edges to give them definition and add interest to the arch. The proposed changes will result in the total loss of the historic form of this bridge and much of the original fabric.

In order to reduce harm, every care should be taken when demolishing the bridge so as much original undamaged stonework as possible can be retained for re-use. Where new stonework is needed, this should be as close a match as possible to the original stone, and courses should match up to minimise the visual impact of the works. We welcome the use of natural cut stone copers.

MVL3/8 - Heyrod/Springbank Lane Footbridge
The appearance of this bridge will change slightly through the introduction of new copers which will increase parapet height. The use of natural stone will help to minimise the appearance of the new copers and mean they were be less obvious. Overall, there will be a very low level of less than substantial harm to this bridge.

MVL3/17 - Roughtown Road Overbridge
This is another bridge where the proposals involve the introduction of new copers

SUITES 3.3 AND 3.4 CANADA HOUSE 3 CHEPSTOW STREET MANCHESTER M1 5FW

Historic England

which will increase parapet height. The changes here will be more noticeable than at MVL3/8 but still constitute a low level of less than substantial harm.

In order to minimise harm, it will be necessary to carefully design the ends of the new sections of coping stones to manage how they interact with the piers of the bridge. The piers are topped by shallow pyramidal caps, which currently form a prominent feature of the bridge's architecture. There is a danger that the definition of these caps will become lost if the new copers butt up to them. This mitigation could be achieved by either terminating the new copers short of the piers, or by raising the height of the pier caps so they remain prominent.

Additional mitigation should involve repairs to the fabric of the parapet walls, including removal of the cement kerb section and bollards, which will no longer be needed once the road is one-way.

MVL3/20 - Wright's Mill Overbridge
The proposals for demolition and reconstruction of this bridge will result in a substantially altered structure and substantial harm to the significance of the listed asset.

The historic form and materials of this bridge are very similar to MVL3/7, and the proposed construction works are also comparable, however the proposed parapet at MVL3/20 will be noticeably taller due to the bridge's use as a bridleway. The proposal drawings show the ends of the new copers sharply sloping down towards the piers of the bridge.

As advised with MVL3/17 above, care should be taken in the design and integration of these copers so they complement the existing structure and do not appear overly obvious. As with MVL3/7, we advise that every care should be taken when demolishing the bridge so as much original undamaged stonework as possible can be retained for re-use. Where new stonework is needed, this should be as close a match as possible to the original stone, and courses should match up to minimise the visual impact of the works.

Next Steps

I look forward to reviewing the next series of proposals for other parts of the scheme.

Yours sincerely

Louise Davies

Our ref: PA01200823
18 July 2025

Dear Sarah

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the recent meetings to review the draft Heritage Statements that will be submitted for Listed Building Consent applications for changes to bridges on the proposed Transpennine Route Upgrade line.

The Heritage Statements are well considered and it is clear that alternative options to reconstruction have been investigated in each case, which are helpfully set out in tables in the reports. The proposals will result in substantial harm to listed bridges along the route, however clear justification for this has been set out in the Heritage Statements.

We very much welcome the inclusion of heritage interpretation at Greenfield Station. This is a significant early rail route and there is notable educational potential in the material that has been generated from the research into the railway structures as part of this project.

Regarding Oaklands Road underbridge MVL3/25, we are comfortable with the design of the proposals for the reconstruction of the parapet and stone turrets. These have been carefully considered to minimise the visual impact.

Next Steps

We appreciate having been involved at pre-application stage in this important project, and value being able to feed into design plans. If you require further pre-application advice please get in touch.

Yours sincerely

1. INTRODUCTION

1.1 Transpennine Route Upgrade

1.1.1 The Transpennine Route Upgrade (TRU) is a major, multi-billion pound program of improvements to increase capacity, improve journey time and reliability performance of rail services on the Transpennine Route.

1.1.2 The TRU will aim to deliver:

- An improved journey time for Leeds – Manchester Victoria of 42-44mins;
- An improved journey time for York to Manchester Victoria of 65-67mins;
- Capability to operate four 'express' and two 'semi-express' services an hour;
- Capability to operate up to two 'local services' an hour on the route;(subject to future operating timetables);
- Performance of the Transpennine Route to be 92.5% or higher each period;
- Larger freight containerisation capability (W12 gauge);
- Freight paths/rights to be retained as existing; and
- A contribution to Network Rail's Decarbonisation Strategy and climate policy.

1.1.3 The Network Rail (Stalybridge to Diggle (Saddleworth) Enhancement) Order extends from Stalybridge Tunnel in the west, through to the western portal of Standedge Tunnel (the "Scheme"). This section of the Transpennine Route follows the Tame Valley from Stalybridge to Diggle, and is referred to hereafter as Route Section W2B.

1.1.4 The TRU programme in Route Section W2B involves a variety of works including the electrification of the railway (installation of overhead line equipment (OLE) and associated infrastructure), reconstruction and modification of existing bridges to facilitate electrification of the railway, construction of a new station at Mossley, closure of Stockport Road Level Crossing and Moorgate Halt Level Crossing, railway works at Greenfield Station to support the upgrade and electrification of the railway track reconfiguration works and track lowering works through Stalybridge and Scout Tunnels.

1.1.5 Under the Planning (Listed Buildings and Conservation Areas) Act 1990, consent is required from the local planning authority for any proposed works that would affect the character of a listed building.

The Transport and Works Act 1992 introduced section 12(3A) into the Planning (Listed Buildings and Conservation Areas) Act 1990, the effect of which is to 'call-in' for determination by the Secretary of State applications to the local planning authority for listed building consent where such consent is required in consequence of proposals included in an application for a Transport and Works Act Order (TWAO). The procedures in the Transport and Works Applications (Listed Buildings, Conservation Areas and Ancient Monuments Procedure) Regulations 1992 then apply to the call in of such listed building consent applications.

1.1.6 This Heritage Statement has been compiled in support of an application for listed building consent by Network Rail in respect of the proposed works on the grade ll listed Wright's Mill Overbridge (MVL3/20) (NHLE 1452406). Wright's Mill Overbridge (NGR SD9786003652) is located in Mossley on the border of Oldham Borough Metropolitan Council (OMBC) and Tameside Borough Metropolitan Council (TMBC), approximately 1.6km to the south of Greenfield Station. A location plan is provided in Appendix A. Due to the structure straddling the boundary of two Local Planning Authorities, identical applications for listed building consent are being submitted to both OMBC and TMBC.

1.1.7 The Historic England list description (included in full in Appendix B) names the listed building as "Railway Overbridge MVL3/20 Wright's". Throughout this Heritage Statement the structure is referred to as "Wright's Mill Overbridge (MVL3/20)".

1.1.8 The preparation of this assessment has been informed by the Statement of History and Significance: West of Leeds (Alan Baxter Associates, 2024) and the Route-wide Statement of Significance (Alan Baxter Associates, 2019).

1.2 Scope

1.2.1 The requirement for this assessment and its scope is guided by policy contained within the National Planning Policy Framework (NPPF 2025), specifically paragraph 207, which seeks an assessment proportionate to the importance of the affected heritage asset and sufficient to understand the potential impacts of development. The specific scope of this assessment is determined by Network Rail's requirement to provide an objective assessment of the heritage value of assets that may be affected by the Scheme, and to appraise the nature and extent of any impact upon setting and significance.

1.2.2 This Heritage Statement will:

- Identify and discuss the heritage significance of the listed structure, including the contribution of setting;
- Present the design requirements of the Scheme at the structure;
- Present the process of development and optioneering which has led to the design proposal for the Scheme in relation to the structure;
- Identify the impacts of the design proposal on the significance of the structure, in the context of current national and local planning policy and guidance;
- Discuss any mitigation recommended in relation to the structure; and
- Consider the public benefits to be gained from the Scheme weighed against the impact on the significance of the structure, in line with the NPPF, the Tameside Unitary Development Plan (2004), and the Oldham Local Development Framework (2011).

1.3 Current Conditions

1.3.1 Wright's Mill Overbridge (MVL3/20) is a mid to late 1840s masonry overbridge, designed by Alfred Stanistreet (A.S.) Jee for the Huddersfield and Manchester Railway (Insert 1-1). The overbridge is situated in the Roaches / Quick area to the north of Mossley, c. 6.7 km east of Oldham and comprises a single segmental-arched bridge, currently carrying a footpath over the Transpennine Route.

Insert 1-1 Wright's Mill Overbridge (MVL3/20) lower mileage (south) elevation

1.3.2 The structure was subject to detailed examination as part of the Network Rail's maintenance regime in August 2017, which identified that structure is in fair condition albeit with minor defects. A more recent visual inspection was undertaken in July 2022 identified no change in the overall condition of the structure. Minor defects identified in the detailed report include:

- Open joins, seepage and soot staining on the arch soffits (Insert 1-2);
- General weathering on the arch wing, abutments, bedstones, cills and wingwalls;.
- Scraped stonework on the upside haunch of the arch soffit;
- Isolated open joints on the parapets and spandrel walls (Insert 1-4);
- Signs of waterproof failure and seepage to the soffit and down the abutment; and
- General weathering, isolated joints, and dense vegetation on the wing walls.

Insert 1-2 Wright's Mill Overbridge (MVL3/20), water seepage visible on arch soffit.

Insert 1-3 Wright's Mill Overbridge (MVL3/20), spalling on soffits.

Insert 1-4 Wright's Mill Overbridge (MVL3/20), open joints and vegetation to southern parapet

1.4 Summary of proposal

1.4.1 In order to achieve the TRU Programme objectives, electrification of the Route is required. This would require the alteration of a number of existing bridges, including Wright's Mill Overbridge (MVL3/20) to accommodate OLE, higher line speed and increased freight trains. Following optioneering, it has been determined to be necessary to reconstruct Wright's Mill Overbridge (MVL3/20). The works will therefore enable the implementation of the Order Scheme.

2. LEGISLATION AND POLICY CONTEXT

2.1 Legislation

2.1.1 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) ("Act") governs the designation and works to listed buildings in England.

2.1.2 The Act states in s.1 (5):

'*In this Act "listed building" means a building which is for the time being included in a list compiled or approved by the Secretary of State under this section; and for the purposes of this Act—*

a) any object or structure fixed to the building;

b) any object or structure within the curtilage of the building which, although not fixed to the building, forms part of the land and has done so since before 1st July 1948, shall be treated as part of the building.'

2.1.3 Under the Act, no one is permitted to undertake or cause to be undertaken any works that would affect the character of a listed building unless the works are authorised. Section 16 of the Act identifies that whether such works can be carried out is determined by the local planning authority or the Secretary of State:

'(1) Subject to the previous provisions of this Part, the local planning authority or, as the case may be, the Secretary of State may grant or refuse an application for listed building consent and, if they grant consent, may grant it subject to conditions.

(2) In considering whether to grant listed building consent for any works the local planning authority or the Secretary of State shall have special regard to the desirability of preserving and enhancing the building or its setting or any features of special architectural or historic interest which it possesses.

(3) Any listed building consent shall (except in so far as it otherwise provides) ensure for the benefit of the building and of all persons for the time being interested in it.'

2.1.4 In relation to the granting of listed building consent, Section 17 of the Act stipulates listed building consent that conditions attached may include those with respect to:

a) ' the preservation of particular features of the building, either as part of it or after severance from it;

b) the making good, after the works are completed, of any damage caused to the building by the works; [and]

c) the reconstruction of the building or any part of it following the execution of any works, with the use of original materials so far as practicable and with such alterations of the interior of the building as may be specified in the conditions'.

2.1.5 It is also defined in s.17 (2) that a condition '*may also be imposed requiring specified details of the works (whether or not set out in the application) to be approved subsequently by the local planning authority or, in the case of consent granted by the Secretary of State, specifying whether such details are to be approved by the local planning authority or by him*'.

2.1.6 The Act also states in s.66 (1):

'*In considering whether to grant planning permission or permission in principle for development which affects a listed building or its setting, the local planning authority or, as the case may be, the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses'*.

2.2 National Policy

2.2.1 The National Planning Policy Framework (NPPF, 2025) sets out the Government's planning policies for England and how these should be applied to contribute to the achievement of sustainable development, supported by the Planning Practice Guidance (updated July 2019) (MHCLG, 2019).

2.2.2 Section 2 of the NPPF outlines the principles of achieving sustainable development including, in Paragraph 8, an environmental objective 'to protect and enhance our natural, built and historic environment'. Paragraph 9 sets out that these objectives should be delivered through the preparation and implementation of plans and the application of the policies within the NPPF. Section 16 of the NPPF deals specifically with the historic environment. Where changes are proposed, the NPPF sets out a clear framework to ensure that heritage assets are conserved, and where appropriate enhanced, in a manner that is consistent with their significance.

2.2.3 This Heritage Statement aims to address relevant policy within the NPPF in relation to Section 16 'Conserving and enhancing the historic environment' which includes guidance on plan making, managing Historic Environment Records; how to determine proposals affecting the historic environment; and how to consider potential impacts on significance.

2.2.4 The following paragraphs as set out in the NPPF include key provisions considered of particular importance to this application:

- Paragraph 207 – '*In determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand the potential impact of the proposal on their significance.'*
- Paragraph 212 – '*When considering the impact of a proposed development on the significance of a designated heritage asset, great weight should be given to the asset's conservation (and the more important the asset, the greater the weight should be). This is irrespective of whether any potential harm amounts to substantial harm, total loss, or less than substantial harm to its significance*.'
- Paragraph 213 – '*Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification. Substantial harm to or loss of:*

    a) Grade II listed buildings, or grade II registered parks and gardens, should be exceptional.'

    b) Assets of the highest significance, notably scheduled monuments, protected wrecks, registered battlefields, grade I and II listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional.*

- Paragraph 214 – '*Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss, or all of the following apply:*

    a) the nature of the heritage asset prevents all reasonable uses of the site; and

    b) no viable use of the heritage asset itself can be found in the medium term through appropriate marketing that will enable its conservation; and

    c) conservation by grant-funding or some form of not for profit, charitable or public ownership is demonstrably not possible; and

d) the harm or loss is outweighed by the benefit of bringing the site back into use.'

- Paragraph 215 – '*Where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate, securing its optimum viable use.'*
- Paragraph 216 – '*The effect of an application on the significance of a non-designated heritage asset should be taken into account in determining the application. In weighing applications that directly or indirectly affect non-designated heritage assets, a balanced judgment will be required having regard to the scale of any harm or loss and the significance of the heritage asset.'*
- Paragraph 219 - '*Local planning authorities should look for opportunities for new development within Conservation Areas and World Heritage Sites, and within the setting of heritage assets, to enhance or better reveal their significance. Proposals that preserve those elements of the setting that make a positive contribution to the asset (or which better reveal its significance) should be treated favourably*.'

Planning Practice Guidance

2.2.5 The Planning Practice Guidance (PPG) (MHCLG, 2019) provides further advice and guidance that expands the policy outlined in the NPPF. It expands on terms such as 'significance' and its importance in decision making. The PPG clarifies that being able to properly assess the nature, extent and the importance of the significance of the heritage asset and the contribution of its setting, is very important to understanding the potential impact and acceptability of development proposals (paragraph 008 Reference ID: 18a-008-20190723).

2.2.6 The PPG states that in relation to setting, a thorough assessment of the impact on setting needs to take in to account, and be proportionate to, the significance of the heritage asset under consideration and the degree to which proposed changes enhance or detract from that significance and the ability to appreciate it (paragraph 009 Reference ID: 18a-009-20190723).

2.2.7 The extent and importance of setting is often expressed by reference to visual considerations. Although views of or from an asset will play an important part, the way in which an asset is experienced in its setting is also influenced by other environmental factors such as noise, dust and vibration from other land uses in the vicinity, and by our understanding of the historic relationship between places.

2.2.8 Paragraph 013 of the PPG recognises that the contribution that setting makes to the significance of the heritage asset does not depend on there being public right or the ability to experience that setting. When assessing any application for development which may affect the setting of a heritage asset, local planning authorities may also need to consider the implications of cumulative change (Paragraph: 013 Reference ID: 18a-013-20190723 Revision date: 23 07 2019).

2.2.9 In relation to substantial harm, the PPG states that 'it is the degree of harm to the asset's significance rather than the scale of the development that is to be assessed' (paragraph 017). Harm to heritage assets can be avoided or minimised if proposals are based on a clear understanding of the heritage asset and its setting (paragraph 008 Reference ID: 18a-008-20190723). The NPPF indicates that the degree of harm should be considered alongside any public benefits that can be delivered by development.

2.3 Local planning policy

2.3.1 Oldham Joint Core Strategy and Development Management Policies

2.3.2 Local planning policy for Oldham Metropolitan Borough Council (OMBC) is provided by the Joint Core Strategy and Development Management Policies of the Oldham Local Development Framework, adopted in November 2011, and a small number of retained policies from the Unitary Development Plan (2006).

2.3.3 Policy 24 relates to the Historic Environment and is reproduced in full below:

Policy 24 Historic Environment

'Oldham has a rich historic environment with many significant and valuable features, structures and characteristics. The council will protect, conserve and enhance these heritage assets and their settings which adds to the borough's sense of place and identity.

Development proposals must have regard to:

- National and local guidance and policies on the historic environment.
- Oldham Rochdale Housing Market Renewal Pathfinder Heritage Assessments.
- Greater Manchester and Oldham Urban Historic Landscape Characterisation Study.
- Conservation Area Appraisals and Management Plans, where appropriate.

When allocating sites and determining applications for planning and advertisement consents, the council will seek to protect, conserve and enhance the architectural features, structures, settings, historic character and significance of the borough's heritage assets and designations including:

a) Listed buildings.

b) Conservation areas.

c) Registered parks and gardens (their historic character and setting).

d) Scheduled ancient monuments (their archaeological value and interest).

e) Significant archaeological remains.

2.3.4 *Locally significant buildings, structures, areas or landscapes of architectural or historic interest (including non-designated locally significant assets identified in the local lists compiled by the council).*

The council will support heritage-led regeneration, including the reuse of historic buildings such as mills, to achieve economic, community and regeneration objectives, where appropriate.

Listed Buildings

Development to, or within the curtilage or vicinity of, a listed building or structure must serve to preserve or enhance its special interest and its setting. There will be a strong presumption against proposals involving the demolition of listed buildings or structures. Proposals which would lead to the loss or cause harm to grade I and II listed buildings should be wholly exceptional. Development proposals for a building incorporating a historic shop front should make provision for its retention, restoration and repair.*

Local Designations

Development which would affect the following designations will only be permitted in cases where it can be demonstrated that the benefits of the development brings substantial benefits to the community which outweigh the preservation of the heritage asset:

Significant archaeological remains.

Locally significant buildings, structures, areas or landscapes of architectural or historic interest'.

Tameside Unitary Development Plan

2.3.5 The Tameside Unitary Development Plan is part of the statutory Local Plan policies for the Tameside Metropolitan Borough Council (TMBC) which provides the set of planning policies which make up the current local plan.

2.3.6 The Tameside Unitary Development Plan sets out local planning policies that 'provide a framework for development and conservation over the whole of the Tameside area, to set out the main considerations on which planning applications in the Borough are determined, and to guide land use decisions by the Council and other agencies'.

2.3.7 Policies within the framework which are relevant to this Heritage Statement are outlined below.

Policy C Conservation and Enhancement of the Built Environment.

Policy C1 Townscape and Urban Form

In considering proposals for built development, the Council will expect the distinct settlement pattern, open space features, topography, townscape and landscape character of specific areas of the Borough to be understood, and the nature of the surrounding fabric to be respected. The relationship between buildings and their setting should be given particular attention in the design of any proposal for development.

Urban design frameworks will be produced for particular areas and corridors in the Borough, as supplementary planning guidance, setting out fundamental principles which should be followed and from which detailed design may be interpreted.

The Council will establish a strategy to secure the retention and enhancement of landmark buildings which form a distinctive element of the local skyline or townscape, and which represent a unique part of the heritage of the area. Re-use and conversion of such buildings which become redundant will be permitted, subject to other relevant policies.

Policy C5 Alternative Uses, Alterations and Additions for Listed Buildings

Whilst continuation of the use for which the building was designed is most desirable, the Council will permit alternatives uses for Listed Buildings where evidence demonstrates that the existing or original use is unlikely to support the maintenance and preservation of the building.

The Council will require that proposed new uses, or other alterations and additions to Listed Buildings, should not adversely affect the essential character of the building, should be in keeping with its architectural style and features, and should harmonise with its surroundings. The effect of the proposals on any protected species which may be using the Listed Building should also be taken into account.

Such development must be of a high standard of design. The external appearance, design and materials will be expected to match as near as possible those of the existing building and, where appropriate, new internal features should also harmonise with the existing.

Extensions and additions should be secondary in scale, design and location to the principal building and standard solutions or modern features which fail to relate to the character of the building will not be permitted

Policy C6: Setting of Listed Buildings

New development, including any proposed as a result of a new use for a Listed Building, which fails to preserve, or detracts from, the setting of a Listed Building or structure will not be permitted.

Policy C8 Demolition of Listed Buildings

The Council will not recommend the demolition of Listed Buildings, apart from in exceptional circumstances after the following considerations have been assessed:

the condition of the building and the cost of repairing and maintaining it in relation to its importance and to the value derived from its continued use, and

the adequacy of efforts that have been made to retain the building in its present use or to find compatible alternative uses, and

the merits of alternative proposals for the site.

In such circumstances the Council will also need to be satisfied that an acceptable alternative form of development can go ahead on the site as soon as practical following demolition, that any use of the building by protected species has been taken into account, and that provision can be made to record the detail of the building prior to demolition

Places for Everyone

2.3.8 Places for Everyone (Greater Manchester Combined Authority 2024) is a joint development plan covering nine Greater Manchester districts including Tameside and Oldham, setting out a framework for sustainable development. Policy JP-P2 concerns Heritage and is of relevance to this assessment:

Policy JP-P2: Heritage

We will proactively manage and work with partners to positively conserve, sustain and enhance our historic environment and heritage assets and their settings. Opportunities will be pursued to aid the promotion, enjoyment, understanding and interpretation of heritage assets, as a means of maximising wider public benefits and reinforcing Greater Manchester's distinct character, identity and sense of place.

Local Plans will set out the key elements which contribute to the district's identity, character and distinctiveness and which should be the priority for conserving and enhancing in the future and demonstrate a clear understanding of the historic environment and the heritage values of sites, buildings or areas and their relationship with their surroundings. This knowledge should be used to inform the positive management and integration of our heritage by:

Setting out a clear vision that recognises and embeds the role of heritage in place-making;

Ensuring that the heritage significance of a site or area is considered in accordance with national planning policy in the planning and design process and opportunities for interpretation and local engagement are optimised;

Integrating the conservation and enhancement of heritage assets and their settings, with creative contextual architectural responses that contribute to their significance and sense of place;

Delivering positive benefits that sustain and enhance the historic environment, as well as contributing to the economic viability, accessibility and environmental quality of a place, and to social wellbeing; and

Exploring opportunities to reduce greenhouse gas emissions that restoration of historic buildings offer.

Particular consideration will be given to ensure that the significance of key elements of the historic environment which contribute to Greater Manchester's distinctive identity and sense of place are

protected from harm. These include historic town centres, places of worship, historic transport routes including the canal network, industrial buildings and structures including textile mills, farmsteads and other sites, buildings, and areas of identified archaeological, architectural, artistic and/or historic value. Development proposals affecting designated and non-designated heritage assets and/or their settings will be considered having regard to national planning policy. Where heritage assets have been identified as being at risk, Local Plans should identify specific opportunities for them to contribute to regeneration and place-making, and they should set out strategies for their repair and re-use. Development proposals which will help safeguard the significance of and secure a sustainable future for Greater Manchester's heritage at risk will be supported in principle, provided they are not contrary to national policy or other policies in the development plan. Proposals should be informed, as necessary, by the findings and recommendations of the appropriate heritage assessment(s) in the development plan evidence base and/or any updated heritage assessment submitted as part of the planning application process.

Historic England Guidance

2.3.9 Historic England has published a series of Good Practice Advice (GPA) notes and Advice Notes (AN) of which those of most relevance to this appraisal are GPA2 – Managing Significance in Decision-taking (Historic England, 2015), GPA3 – The Setting of Heritage Assets (Historic England, 2017), and AN12, Statements of Heritage Significance (2019).

2.3.10 GPA2 – Managing Significance in Decision-taking emphasises the importance of having a knowledge and understanding of the significance of heritage assets likely to be affected by the development and that the 'first step for all applicants is to understand the significance of any affected heritage asset and, if relevant the contribution of its setting to its significance' (paragraph 4). Early knowledge of this information is also useful to a local planning authority in pre-application engagement with an applicant and ultimately in decision making (paragraph 7).

2.3.11 GPA3 – The Setting of Heritage Assets provides advice on the setting of heritage assets. Setting is as defined in the NPPF and comprises the surroundings in which a heritage asset is experienced. Elements of a setting can make positive or negative contributions to the significance of an asset and affect the ways in which it is experienced. Historic England state that setting does not have a boundary and what comprises an asset's setting may change as the asset and its surrounding evolve. Setting can be extensive and particularly in urban areas or extensive landscapes can overlap with other assets. The contribution of setting to the significance of an

asset is often expressed by reference to views and the GPA in paragraph 11 identifies those views, such as those that were designed or those that were intended, that contribute to understanding the significance of assets.

2.3.12 AN12, Statements of Heritage Significance outlines a recommended approach to assessing the significance of heritage assets in line with the requirements of NPPF. It includes a suggested reporting structure for a 'Statement of Heritage Significance', as well as guidance on creating a statement that is proportionate to the asset's significance and the potential degree of impact of a proposed development. The AN also offers an interpretation of the various forms of heritage interest that an asset can possess, based on the terms provided in the NPPF Glossary (Annex 2); namely archaeological, architectural, artistic, and historic.

3. ASSESSMENT METHODOLOGY

3.1 Research

3.1.1 In accordance with Historic England guidance and as determined by policy requirements, this assessment identifies the baseline heritage interest of Wright's Mill Overbridge (MVL3/20). The historical narrative informing the baseline has been derived from a review of various resources including maps and other cartographic and photographic sources. Statutory information in relation to the designated assets has been obtained from the National Heritage List for England maintained by Historic England and the Historic Environment Record maintained by Greater Manchester Archaeology Advisory Service.

3.1.2 Additional information concerning the assets, their condition, use and setting has been obtained from a walkover survey undertaken by suitably qualified and experienced heritage specialists on 21 and 22 of May 2024.

3.2 Significance and setting

3.2.1 Assessment of the significance of heritage assets and their setting has been undertaken in consideration of guidance issued by Historic England. Significance is often established by statutory designations such as listed buildings, scheduled monuments and conservation areas. More particular advice as to what makes up significance is set out in AN12, which establishes a method for thinking consistently about the heritage values that can be ascribed to a place. When making an assessment of significance, numerous aspects are considered including architectural interest, historic interest, group value, social value, former uses and local distinctiveness. These aspects are grouped into four values defined in Annex 2 of the NPPF

as historical interest, archaeological interest, artistic interest, and architectural interest. In assessing whether the setting of an asset contributes to its significance, and in assessing the effect of development, Historic England GPA3 provides a checklist of attributes that may affect setting and significance under five broad categories comprising:

- The location and siting of the development;
- The form and appearance of the development;
- Additional effects (change to skyline etc.);
- Permanence; and
- Consequential effects.

4. CONSULTATION

4.1.1 Historic England, Oldham Metropolitan Borough Council (OMBC) and Tameside Metropolitan Borough Council (TMBC) have been involved in ongoing stakeholder consultation with Network Rail through the development of Route Section W2B of TRU.

4.1.2 Regular meetings with both Historic England, OMBC and TMBC have been held to discuss design development of the proposals in relation to Wright's Mill Overbridge (MVL3/20). Initial meetings were held periodically throughout 2021 and resumed in 2024 to discuss the overall route and design development for all listed structures within Route Section W2B.

4.1.3 The design development of the Scheme in relation to Wright's Mill Overbridge (MVL3/20) was discussed during meetings with the statutory stakeholders on the dates outlined in Table 4 1

Table 4-1 Consultation for Wright's Mill Overbridge (MVL3/20)

Date	Stakeholder in attendance	Key agreements/items discussed
2 March 2021	• OMBC • Historic England	• An overview of the optioneering for MVL3/23 which also included some optioneering for MVL3/20. • Presentation of options to stakeholders comprising: o Track Lower and retention of bridge with raised parapets; o Footbridge reconstruction; and o Bridge reconstruction.

Date	Stakeholder in attendance	Key agreements/items discussed
2 March 2021	• TMBC	• Overview of structures at GRIP 3 stage including Wright's Mill Overbridge (MVL3/20) and presentation of preferred option which included: o Sympathetic reconstruction of arch, while retaining existing parapets. Use of bridge as a bridleway will be taken into consideration with the parapet heights.
26 May 2021	• Historic England • OMBC • TMBC • Kirklees Council	• Overview of the structures along Route Section W2B which are of historic interest, including the grade II overbridges and underbridges which are noted for their inherent significance, particularly as essential railway structures. The group value of the bridges was identified as a key contributor to significance. • Presentation of the purpose of Heritage Statements and their assessment of impact with the emerging GRIP 3 designs • Early-stage recommendations to minimise harm to significance against the requirements for justification of proposals and opportunities to pursue sensitive design and compensation. • Early-stage recommendations to minimise harm to significance against the requirements for justification of proposals and opportunities to pursue sensitive design and compensation. The proposed reconstruction of MVL3/20 was presented, due to the potential level of impact this structure was flagged as red on a RAG scale. Reassurance was provided to the councils that they will be involved in the GRIP 3 design process which will be used within the detailed design development of GRIP 4 (Single Option Development). Clarification was also provided on the sustainable heritage initiatives. • Historic England stated that they expect to get an understanding of significance at this stage and that they anticipate options to be shared for comment. Also stressed the importance of minimising harm.
2 February 2024	• TMBC	• This meeting was used to outline to members of the Local Planning Authority the significance of MVL3/20, along with site specific constraints and the feasibility study of potential options. • The principle for reconstructing the bridge as the preferred option was established.

Date	Stakeholder in attendance	Key agreements/items discussed
		• Discussion took place regarding the proposed form of the reconstructed deck, with a filler beam being the preferred option. • The options for parapet construction were presented. However, given that MVL3/20 is an active bridleway it is acknowledged that the height of the parapet will need to be 1.8 m.
6 February 2024	• Historic England	• Details of the challenges of the electrification of the route in relation to listed overbridges were presented. Design measures under consideration for addressing these challenges noted to include: o Reduced voltage clearances; o Development of scheme-specific pantograph, reducing electrical clearances to a minimum; o Site specific risk assessments of bridges due to reduced overhead wire heights; o Electrical protection works; and o Risk-based approach to raising parapets. Where safe to do so, 1.5 m height parapets may be employed, rather than standard 1.8 m height. • This approach has been embedded in designs for W2B. • The design approach for electrification across / under existing railway bridges was noted to have agreed in principle by Network Rail and following consultation with the Local Authorities & Historic England at the preceding design stage. • The approach to bridge reconstruction was outlined, with key design aspects discussed including: o Retention of existing approach walls; o Visibility of new concrete elements to be minimised through the use of masonry cladding; o Stringcourse detail incorporated into the form of the edge beam; o Reclaimed stone used to clad interior of parapet; natural stone used to clad exterior; o Coursing of cladding to tie in with existing stonework as far as reasonably practicable; and

Date	Stakeholder in attendance	Key agreements/items discussed
		○ Where reclaimed stone cannot be reused, natural stone of matching size and colour will be used. Confirmation that the design optioneering will be undertaken in consultation with Historic England.
5 March 2024	• Historic England	• Presentation of information on the background and optioneering process for Wright's Mill Overbridge (MVL3/20) including the justification for the preferred option. • Network Rail presented discussion about parapet height given that the bridge is used by equestrians which would require the parapet to be 1.8 m however seeking opportunity to reduce height to 1.5m to minimise visual impact.
9 April 2024	• Historic England	• Presentation of information on proposals for the bridge, identifying that works to Wright's Mill Overbridge (MVL3/20) would require a reconstruction.
15 April 2024	• Historic England	• Letter provided to Historic England summarising outcome of meetings on 5th March and 6th April 2024 which discussed proposals for MVL3/20 and sets out the matters agreed. • Agreement that MVL3/20 is not suitable for retention due to existing constraints and challenges, and the identification of reconstruction as the preferred option being agreed with Historic England.
7 May 2024	• Historic England	• Agreement in principle with Historic England on the principle of reconstruction at Wright's Mill Overbridge (MVL3/20).
14 May 2024	• TMBC	• Presentation of approach for copers for MVL3/20. As part of the reconstruction of the bridge, the new copers will be designed to tie in with the existing approach walls. • Preferred solution for new copers is coloured concrete which was in support by Historic England.
24 May 2024	• TMBC	• This meeting was used to outline to members of the Local Planning Authority (following changes in personnel) the significance of Wright's Mill Overbridge (MVL3/20), along with site specific constraints and the feasibility study of potential options.

Date	Stakeholder in attendance	Key agreements/items discussed
		• Overview of listed structures subject to listed building consent, including MVL3/20 Wright's Mill Overbridge and the electrification challenges. • Confirmed that the bridge is not clear for electrification or freight and track lowering is not a viable option given the shallow depth of bedrock and proximity of underbridge and therefore reconstruction design was progressed. • Identification of reconstruction constraints including site access. • Council expressed preference for use of stone on the underside of the bridge, and the retention of as much original material as possible
24 June 2024	• OMBC	• Presentation of optioneering of Wright's Mill Overbridge (MVL3/20). Challenges and considerations taken into account included the existing electrical clearance, which was found to be foul on both lines, desire to accommodate freight clearance and the geological challenges. ○ Option 1: Reconstruction: - Standard solution for all listed structures and agreed in principle with Historic England. The approach walls would be retained, and the arch span reconstructed as a flat span for better gauge clearance. Stone will be reclaimed and reused were possible for cladding, and matching stonework will be used where this is not possible. - Works would be undertaken track side using railway crane. - Council expressed intention to mitigate potential impacts and to ensure the new construction is as close as possible to the existing. Though there was a desire to retain the string course, it was deemed unsafe by Network Rail standards. ○ Option 2 Track Lowering: - This option would require significant rock removal, extensive track works, as well as reconstruction of Midge Hall Underbridge (MVL3/19). However, this is not acceptable to Network Rails' stakeholders. ○ Option 3 – Footbridge reconstruction:

Date	Stakeholder in attendance	Key agreements/items discussed
		- Replace the existing overbridge with a footbridge made of metallic components similar to elsewhere on the railway line. ○ Option 4 – Removal: - This would require significant diversion of the bridleway. • It was concluded that option 1 was the preferred option and outstanding question for whether LBC is required for both councils.
25 June 2024	• Historic England	• Pre-application advice letter from Historic England identifies that the reconstruction of MVL3/20 would result in substantial harm to the significance of the bridge (Appendix C.1). • Historic England summarised that substantial harm would arise from the loss of the form of the arched bridges and through the loss of historic fabric, with additional harm identified to the group value of the bridges. • It was agreed that reclaimed stone should be focussed on the inside faces of the parapet to minimise the degree to which the alteration of the bridge is experienced from the deck. • Historic England concluded that it will be for the decision taker to weigh the balance of the identified substantial harm against the public benefit of the Scheme.
8 July 2024	• TMBC	• Written response from TMBC on proposed alteration of listed railway bridges identifying the following requirements: ○ Proposed works to listed bridges should be kept to the minimum necessary to facilitate the Scheme and ensure their continued use and enjoyment, whilst retaining as much as practicable of their individual character and appearance. ○ Any replacement stonework and/or new stonework (copings, for example) should be in natural stone.

Date	Stakeholder in attendance	Key agreements/items discussed
		○ Internal elevations of the bridge should be 'clad' or constructed with natural stone. ○ All new stonework at bridge level should respect the colour, texture, form to the existing and follow the same coursing pattern. ○ Any application for listed building consent should be supported by a Heritage Statement prepared in accordance with the NPPF. • Listed building consent drawings to clearly identify on plan and in a methodology / specification details of works including repair work, fencing, and the extent of reconstruction of MVL3/7 and MVL3/20.
27 August 2024	• Historic England	• This meeting was used to present the draft listed building consent drawings to Historic England and to discuss the proposals presented in the drawings for MVL3/20. • It was confirmed that the approach to MVL3/20 would take on a similar approach to MVL3/7 which would use natural stone for the cladding and coping of the proposed concrete elements (other than the edge beam which needs to be visible for inspection). Efforts would be made to tie the coursing of cladding in with the retained sections as best as possible, informed by point cloud data held for the existing structure. • There was discussion of potential methodology for bridge demolition and how this may impact on the level of masonry able to be salvaged. • The parapet height for MVL3/20 would need to be 1.8 m given that it remains in active use as a bridleway.
3 September 2024	• TMBC	• Presentation of visualisations of the structures, including MVL3/20. • Parapet height for the bridge will be required to be 1.8 m to meet the safety requirements given it remains in use as a bridleway.
17 September 2024	• Historic England	• In their pre-application advice letter Historic England confirmed demolition and reconstruction of Wright's Mill Overbridge (MVL3/20) would result in substantial harm to the significance of the bridge (see Appendix C.2). • Careful retention and reuse of stonework for reuse in order to reduce harm was highlighted. Where new stone is required, it was noted that this should

Date	Stakeholder in attendance	Key agreements/items discussed
		be as close a match as possible to the original fabric. • Coursing should match existing fabric to minimise the visual impact of the works. • The use of natural stone cut copers would be welcomed.
28 March 2025	• TMBC	• Consultation to go over the draft Heritage Statements. Comments raised, during this meeting and have since been actioned include: • Request for inclusion of Historic England feedback in appendix to the Heritage Statements • Request for condition surveys subject to Network Rail's approval • Request for further emphasis of public engagement in the reports • Given that Wright's Mill Overbridge lies within the jurisdiction of both TMBC and OMBC, it was suggested by OMBC that a single local authority take on the LBC application in which TMBC agreed.
2 April 2025	• OMBC	• Presentation of overview of the aims and objectives of TRU to OMBC heritage officers, with emphasis on the historic context of Route Section W2B and the 12 listed building consents applications which are being prepared for the various works to the grade II listed bridges and viaduct along the route section. • Presentation of overview of electrification challenges caused by the existing arch profile of a number of existing bridges and have developed bespoke solutions for these to achieve the required clearance. • Overview of the current status of each structure within OMBC's jurisdiction, including the reconstruction of Wright's Mill Overbridge (MVL3/20). • Network Rail explained that the current structure is not clear for electrification or freight, and track lower is not viable at its location, as such the removal and reconstruction of the structure is the preferred option. The design for the new would tie into the existing wing walls and have parapet heights of 1.8m given that it is a bridleway.

Date	Stakeholder in attendance	Key agreements/items discussed
4 April 2025	• Historic England	• Overview of draft comments from Historic England. Request to draw out the heritage interpretation in the reports as part of the heritage benefits. • Historic England were content with the assessment of significance for all structures, and noted that the optioneering tables were helpful. Historic England requestion for further details on the heritage interpretation as part of the heritage benefits.
12 May 2025	• OMBC	• Presentation of proposals for Wrights Overbridge (MVL3/20) to OMBC heritage officers which were noted to be justified and required. • Level of harm to the structure noted to be substantial, but weighed against the substantial public benefits delivered by the Scheme. • Need for protection of reclaimed stone during demolition and transport noted by OMBC, along with the need for sample panels to demonstrate quality of pointing for reconstruction. • Position of the bridge on the boundary of Tameside and Oldham Metropolitan Councils noted to potentially require submission of consent applications to both councils.
24 June 2025	• OMBC	• Pre-application advice letter received from OMBC outlining local planning authority advice following review of the draft listed building consent application material. • OMBC found that the reconstruction of Wright's Mill Overbridge (MVL3/20) would result in substantial harm through the loss of its historic form and much of the original fabric. • OMBC highlight that clear and convincing justification will be required for any harm arising to designated heritage assets, with substantial benefits required to outweigh substantial harm. • A high level of harm was also found to the group value of the bridges designed by A.S Jee on the TransPennine Route, due to the proposed demolition of Wright's Overbridge (MVL3/23) and reconstruction of four other bridges (including Wright's Mill Overbridge (MVL3/20), and a limited

Date	Stakeholder in attendance	Key agreements/items discussed
		level of harm to group value arising from the alteration of three other structures.
18 July 2025	• Historic England	• Pre-application advice letter received from Historic England providing overarching feedback on proposals affecting listed bridges between Stalybridge and Standedge Tunnel (see Appendix C). • Acknowledgment given to the collaborative approach taken at pre-application stage, to fully explore alternative options to reconstruction and for the opportunity for Historic England to feed into design plans. • The heritage statements adjudged to be well considered with clear justification having been provided for the substantial harm identified to those structures proposed for removal or reconstruction. • The inclusion of interpretation at Greenfield Station is welcomed by Historic England.

5. HERITAGE ASSSETS AND THEIR SIGNIFICANCE

5.1 History of the W2B Transpennine Route

5.1.1 The railway connecting Stalybridge to Huddersfield, which runs under Wright's Mill Overbridge (MVL3/20) was constructed by the Huddersfield & Manchester Railway Company between 1846 and 1849. The mid-1840s was a period of commercial confidence and massive expansion in the railway network across England, known as 'Railway Mania' which has been described by Historic England as the Heroic Age (1841-50) of railway building (Historic England, 2017). Between 1845 and 1852 the railway network expanded from 2,345 miles to 7,272 miles (3774km to 11,703km) (Alan Baxter Associates, 2019). Constructed at the height of this boom, the Stalybridge to Leeds line was a product of this trend. Traversing a challenging landscape through the Pennines, the line was planned to follow the route of the Huddersfield Narrow Canal for much of its length, with the canal acquired by the Railway Company the year after its authorisation (Alan Baxter Associates, 2019). These difficult landscape conditions resulted in the need to build several major viaducts and tunnels. These included Standedge Tunnel through the Pennines, which was constructed alongside the 1811 canal tunnel and is 'indisputably significant as a major engineering achievement' (Alan Baxter associates, 2024).

5.1.2 The development and expansion of the railways during the 19th century transformed the landscape and settlements through which they passed, fuelling industrial growth and settlement expansion. The impact of improved communications, first with the arrival of the canal in 1811, and then the railway in 1849, provided valuable links with Huddersfield, Manchester and Leeds, enabling import of raw materials and export of manufactured goods. This fuelled the gradual industrialisation and settlement expansion along the Tame Valley. This can be seen on historic Ordnance Survey maps dating from the 19th and early 20th century where industrial development including mills, dyeworks, printworks and quarries, is shown to have been present along the route of the railway and extending into the more upland areas around Saddleworth and Harrop Dale, whilst settlements such as Mossley and Dobcross gradually expanded.

5.1.3 Wright's Mill Overbridge (MVL3/20) was constructed for the Huddersfield & Manchester Railway Company in the mid to late 1840s. The principal engineer for the Huddersfield & Manchester Railway was Alfred Stanistreet (A. S.) Jee (1816–1858), who was assisted by the more renowned engineer Joseph Locke (1805–1860). Jee's work on the Huddersfield & Manchester Railway represents, arguably, his greatest achievement. This can be seen particularly in the construction of the Standedge Tunnel, which at over three miles long was one of the longest and most difficult in

England, but also through the various large-scale viaducts along the route. In the 1850s, he worked internationally on the Spanish line from Alar-del-Rey to Reynosa where his skill in design, his accuracy and his completeness of the details earned him high praise. He died in a fatal accident upon the opening of the second portion of that line.

5.1.4 In 1847, prior to the opening of the line, the Huddersfield & Manchester Railway Company was taken over by the London and North Western Railway (LNWR). As part of the LNWR network, the Huddersfield & Manchester Railway formed part of a direct route from Manchester to the West Riding, enabling the LNWR to access the textile and coal industries of West Yorkshire. By 1851, the LNWR was the most prominent railway company of the period, with over 800 miles of track and was the largest joint-stock concern of its time, capitalised at £29 million. The line was acquired by the London Midland and Scottish Railway in 1923, before being nationalised in 1948.

5.1.5 Whilst other parts of the Transpennine Route were subject to significant alterations, the Huddersfield & Manchester Railway between Standedge Tunnel and Stalybridge was subject to relatively limited alteration. The Micklehurst Loop was constructed from 1881-85 to provide additional capacity, and diverged from the existing railway to the east of the Tame Vally, avoiding physical interaction with the majority of its alignment. A new junction to the south of Greenfield Station is shown on historic maps from the early 20th century as additional tracks toward Oldham were established from this station. However similarly to the Micklehurst loop, the additional lines diverged from the main Huddersfield line, running westwards at its intersection with Shaw Hall Bank Road Footway (MVL3/26). The railway was also widened to the east of Diggle to accommodate additional tracks serving new bores for the Standedge Tunnel which were added in 1868-71 and 1894, necessitating widening of bridges to the east of the route.

5.1.6 Piecemeal change has occurred on the Huddersfield & Manchester Railway most notably with the closure of a small number of stations along the route, such as Diggle and Saddleworth Stations. The route today forms part of the wider Transpennine Route between York, Selby and Manchester, which comprises sections of rail line developed by different railway companies.

5.1.7 The history and significance of the Transpennine Route is discussed at more length in the Route-Wide Statement of Significance (Alan Baxter Associated, 2019). This was produced to characterise the overall heritage significance of the Transpennine Route as a whole.

5.2 Wright's Mill Overbridge (MVL3/20)

History

5.2.1 Wright's Mill Overbridge (MVL3/20) was constructed between 1845 and 1849 during the Heroic Age of railway building. The single-span bridge was designed by A.S. Jee for the Huddersfield & Manchester Railway and is situated on the historic county boundary which today forms the boundary between Tameside and Oldham.

5.2.2 The bridge is shown carrying a track labelled as Quick Mill Bridge on OS map of 1854 (not reproduced here), likely due to its proximity to Quick Mills, a small cotton mill to the north east of the overbridge, and some development along Midge Hill. At this time, the overbridge was named Quick Mill Bridge. It was located within a predominantly rural environment with dispersed settlement and some small scale industrialisation which forms part of the wider industrial character of the area. A similar situation is shown on the County Series Map of 1899 (Insert 5-1), when the bridge is labelled as Wright Mill Bridge, due to its proximity to the woollen mill to the east of the bridge which is now labelled as Lower Quick or Wright Mill.

5.2.3 Subsequent map editions reveal a similar morphology, with industrial development and gravel extraction focussed along the valley bottom, adjacent to the River Tame and the Huddersfield Narrow Canal, and the surrounding hills remaining as enclosed fields with a dispersed pattern of farms and houses (see Insert 5-3Insert 5-3 1:10,560 County Series Map 1904-1907 showing Wright's Mill Overbridge (MVL3/20) to Insert 5-7). By the early 21st century, the industrial sites along the valley bottom were largely redeveloped with housing, with the building of Wright's Mill to the east of the bridge converted to residential use. Wright's Mill Overbridge (MVL3/20) is shown to have remained in use carrying a bridleway over the railway line.

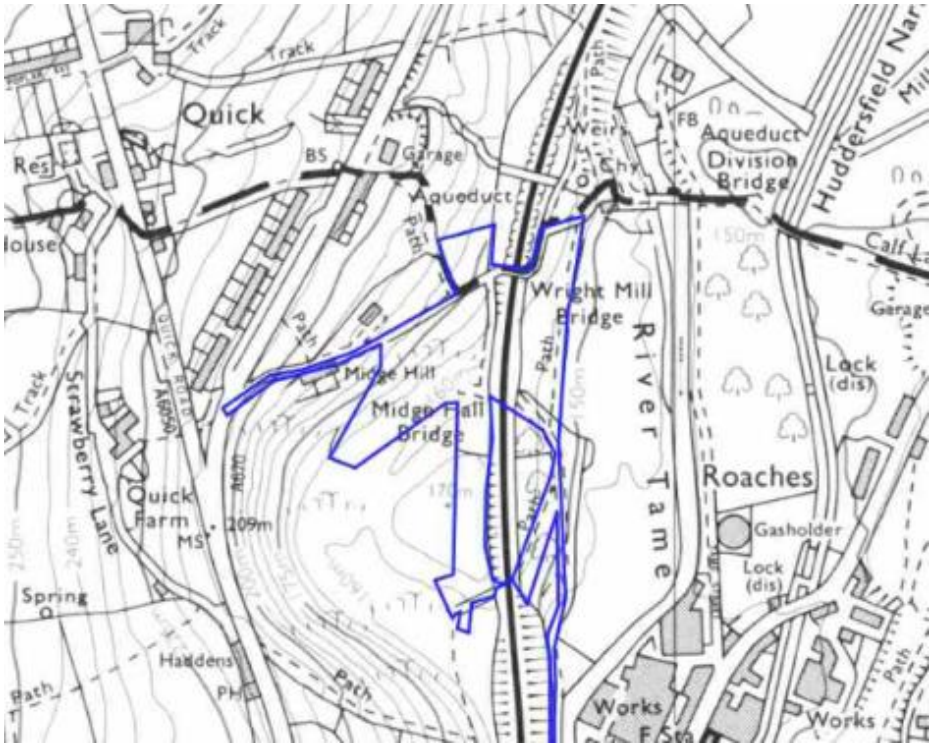
Insert 5-6 1:10,560 County Series Map 1956 showing Wright's Mill Overbridge (MVL3/20)



Insert 5-7 1:10,560 County Series Map 1982 showing Wright's Mill Overbridge (MVL3/20)

Description

5.2.4 Wright's Mill Overbridge (MVL3/20) comprises a single segmental-arched bridge with battered abutments. The overbridge is aligned east to west, sloping downwards towards the east due to the gradient of the local topography, and spans the two-track railway line which is set within a steep cutting. The bridge survives in its original form, with limited evidence of alteration.

5.2.5 The overbridge is constructed in regular-coursed, quarry-faced buff sandstone. It is formed by a segmental arch, which springs from ashlar impost bands. The arch is formed by rusticated v-jointed gritstone voussoirs the keystone of which breaks the line of the arch both above and below, a common design feature with bridges on this route. The voussoirs continue as quoins to each corner of the abutments. The abutments are raked with squared and coursed quarry-faced spandrels. Above the segmental arch is a squared ashlar string course with coped parapet. The abutments terminate in shallow piers with pyramidal caps. The bridge deck is now much overgrown with vegetation (Insert 5-10).

5.2.6 The setting of Wright's Mill Overbridge (MVL3/20) has undergone some change since it was first constructed. The overbridge would have historically been associated with Wright's Mill as per their shared name. However, the removal of the mill in the mid-20th

century, and subsequent development along Midge Hill would have removed some of the historic integrity of its setting. That being said, the overbridge continues to provide a historic linkage between Calf Lane and Midge Hill over the railway and retains its historic use as a bridleway/footbridge. Views to and from the bridge also enable for an appreciation of its rural setting and location within a cutting of the Pennine landscape. Views north and south from the bridge deck also enabled an appreciation of its relationship with the historic railway.

Insert 5-8 Wright's Mill Overbridge (MVL3/20), south elevation (Network Rail, 2022).

Insert 5-9 Wright's Mill Overbridge (MVL3/20), north elevation (Network Rail, 2022).

Insert 5-10 View east across the deck of Wright's Mill Overbridge (MVL3/20).

Significance

5.2.7 Wright's Mill Overbridge (MVL3/20) was designated as a grade II listed building in March 2018. The Historic England List Entry description identifies the bridge to be of special interest for to the following reasons:

- Historic interest:
    - Constructed during the Heroic Age of railway building and a little-altered example of an 1840s overbridge on what is now one of the main railway lines in northern England.
    - Designed by the notable railway engineer Alfred Stanistreet Jee.
- Architectural interest:
    - The bridge is well-detailed with ashlar impost bands and string course, and piers and voussoirs with tooled margins, that lift its design above the purely functional.
- Group value:
    - With the other listed structures designed by Jee on the Huddersfield & Manchester Railway line.

5.2.8 Wright's Mill Overbridge (MVL3/20) is of significance as a largely unaltered example of an 1840s overbridge, dating from the Heroic

Age (1841–50) of railway building and the period of 'railway mania' which marked a time of commercial confidence and expansion in the railways. The bridge's direct historic relationship with historic railway companies of the period, comprising the Huddersfield & Manchester Railway and LNWR, and the notable railway engineer A. S. Jee, who also designed similar structures along the route (see paragraphs 5.2.11 to 5.2.14), give the structure historical value from which it derives significance. The bridge remains in use as a part of the operational railway network and, together with surviving contemporary structures, evidences the historic infrastructure of the Huddersfield & Manchester Railway.

5.2.9 Wright's Mill Overbridge (MVL3/20) derives significance from the quality of its architecture and construction, a characteristic feature of Jee's work for the Huddersfield & Manchester Railway. Architectural elements such as the ashlar impost bands and string course as well as piers and voussoirs with tooled margins and the quality of workmanship across the structure are notable features of Jee's design which elevates the structure above the purely functional. The design language used is consistent with other bridges along this section of the Huddersfield & Manchester Railway, contributing to the understanding of the group value of these related structures. The bridge survives in its original form, with limited evidence of intervention or alteration, and remains in use for its original purpose. The structure still reveals Jee's original design intent and this is a strong contributing factor to its significance.

5.2.10 Wright's Mill Overbridge (MVL3/20) does not derive particular significance from its setting. Its relationship with the railway is a key component of its setting given that the bridge continues to span the railway cutting, retaining a close physical and functional relationship with the railway. Given it location within a deep cutting, views of the bridge are limited, however it is an active bridleway and footpath which enables appreciation of its relationship with the railway looking north and south. To this effect, the setting of Wright's Mill Overbridge (MVL3/20) makes a minor contribution to its overall significance.

Group value

5.2.11 As identified in the list description, Wright's Mill Overbridge (MVL3/20) is recognised to be of group value with other listed structures designed by A.S. Jee on the Huddersfield & Manchester Railway[1]. These comprise:

[1] Wheatley's Overbridge (MVL3/103) (grade II listed NHLE 1450537) was designed by A.S. Jee for the Huddersfield & Manchester Railway. The Overbridge was granted consent for extensive change as part of the Huddersfield to Westtown (Dewsbury) Order section of the Transpennine Route Upgrade, and will be demolished and replaced with a new structure (ref

- Heyrod Hall Overbridge (MVL3/7) (grade II listed, NHLE 1449242);
- Springbank Lane Footbridge (MVL3/8) (grade II listed, NHLE 1452382);
- Spring Bank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (grade II listed, NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405);
- Wrights Overbridge (MVL3/23) (grade II listed, NHLE 1452409);
- Royal George Underbridge (MVL3/25) (grade II listed, NHLE 1451848);
- Shaw Hall Bank Road Footway (MVL3/26) (grade II listed, NHLE 1451852);
- Oldham Road Overbridge (MVL3/28) (grade II listed, NHLE 1451853);
- Wickens Underbridge (MVL3/29) (grade II listed, NHLE 1451854);
- Saddleworth Viaduct (MVL3/31) (grade II listed, NHLE 1068120);
- Slaithwaite Viaduct (MVL3/61) (grade II listed, NHLE 1224049);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);
- Milne Viaduct (MVL3/76) (Longwood Viaduct) (grade II listed, NHLE 1220121);
- Church Street (MVL3/82) (grade II listed, NHLE 1452083);
- Huddersfield Viaduct (MVL3/92) (grade II listed, NHLE 1223531);
- Hillhouse Lane Underbridge (MVL3/94) (Willow Lane East) (grade II listed, NHLE 1432641);and
- B6118 Colne Bridge Road Overbridge (MVL3/107) (grade II, NHLE 1450265)[2].

2021/91337). This is likely to result in de-listing. As such its contribution to group value has therefore been excluded from this assessment.

[2] B6118 Colne Bridge Road Overbridge (MVL3/107)) (grade II, NHLE 1450265) will be partially demolished and rebuilt with a supplementary structure replacing its spans over the railway. Listed building consent has been granted for this considerable intervention (ref: 2021/91330), and as a result may limit the contribution that this bridge makes towards the group value with the Jee bridges.

5.2.12 Of these bridges, four are of particularly similar form to Wright's Mill Overbridge (MVL3/10). These bridges comprise segmental arched bridges of stone construction, which are similarly detailed architecturally. These four overbridges comprise:

- Heyrod Hall Overbridge (MVL3/7) (grade II listed, NHLE 1449242).
- Spring Bank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241).
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405).
- Wrights Overbridge (MVL3/23) (grade II listed, NHLE 1452409).

5.2.13 The group value which Wright's Mill Overbridge (MVL3/20) derives from these relationships provides an understanding of the wider trends and engineering achievement which characterise both the Huddersfield & Manchester Railway and the Heroic Age of railway building (1841-50) more generally. This group value is enhanced by the structures continuing to form part of the operational railway; as a collective group of assets, they are experienced by those following the rail line (traveling on it, or near it) as coherent features of a single historic route.

5.2.14 Masonry railway bridges across the historic Huddersfield & Manchester Railway route have been characterised as being of local or regional interest, depending on their architectural quality, contribution to wider historical interest of the route, and their group value. It has been noted however that, as a group, they are not of substantial national interest due to their dating from a period of railway development when thousands of similar structures were erected (Alan Baxter Associates, 2019).

5.3 Surrounding heritage assets

5.3.1 The location of the designated and non-designated heritage assets discussed below are shown in Appendix A.

Designated heritage assets

5.3.2 A total of two listed buildings are present within 250m of Wright's Mill Overbridge (MVL3/20). These comprise:

- 7, 9, 11 and 11A, Midge Hill (grade II listed, NHLE 1162827), a terrace of three, polite three-storey houses built in the late 18th century, located c.160m to the south-west.
- Huddersfield Narrow Canal Division Bridge (grade II, NHLE 1309462), a roving canal bridge built between 1794 and 1797

to the design of the engineer Benjamin Outram, located c.240m west.

- Numbers 7, 9, 11 and 11A, Midge Hill (NHLE 1162827) are located on the bridleway to the west of Wright's Mill Overbridge (MVL3/20).

5.3.3 The houses do not draw any contribution to their significance from the presence of the bridge. Predating the railway by c. 50 years, views from their principal elevations look to the south, away from the bridge.

5.3.4 The setting of the Huddersfield Narrow Canal Division Bridge (NHLE 1309462) is defined by its position on the canal, and it does not have any visual relationship with the railway bridge. As such, these structures do not have any relationship with Wright's Mill Overbridge (MVL3/20) and do not contribute to each other's significance.

Non-designated heritage assets

5.3.5 The Greater Manchester Historic Environment Record (HER) records six non-designated heritage assets within 250m of Wright's Mill Overbridge (MVL3/20), two of which duplicate the listed buildings identified under Designated Assets above. The remaining asset comprise the following:

- Wright Mill (6045.1.0) is located c. 130 m north-east of the overbridge. This mill complex has largely been demolished and the remaining structures converted to residential use. It does however have a historic relationship with the railway bridge given that it was named after the mill, likely due to their proximity.
- Midge Hall (site of) (17442.1.0) is located c. 210 m to the south west of the overbridge. The hall was first identified on OS Map of 1854 and appears in subsequent maps throughout the 20th century. The structure, however was cleared in the late 1970s to early 80s and remains an undeveloped site.
- Grove Sunday School (former) (17909.1.0) is located c. 150 m to the north west of the overbridge. The structure was established in 1843 to accommodate the New Connexion Methodists Sunday School until 1845 when the building was sold and converted to residential accommodation. The structure is two storeys with attic and stone slate roof and its main entrance fronts onto Mosley Road facing north.
- County boundary stone (former) (17910.1.0) is located c.175m to the north west of the overbridge. It would have been established in 1885 by Mossley Borough Council to identify the boundary between Lancashire and Yorkshire and featured

inscriptions which identified this. The stone was defaced in the Second World War. The boundary stone remains in-situ, though its inscriptions are not as visible.

5.3.6 Midge Hall (17442.1.0), Grove Sunday School (former) (17909.1.0) and The County Boundary Stone (former) (17910.1.0) do not retain a historic relationship with the railway or Wright's Mill Overbridge (MVL3/20). Though glimpses of the bridge can be seen, the overbridge does not make any contribution to its setting given the intervening landscape features and distance between these.

5.3.7 In addition to the non-designated assets recorded by the Greater Manchester HER, two additional non-designated heritage assets have been identified on the Transpennine route. These comprise:

- Midge Hall Underbridge (MVL3/19) is located over the railway alignment c. 100 m to the south of Wright's Mill Overbridge (MVL3/20). The underbridge consists of semi-circular arch which is stepped with rusticated quarry-faced voussoirs with a continuous tooled margin. The soffits have been line with concrete, and modern railings were added to the ashlar parapets. The underbridge remains visible from the setting of Wright's Mill Overbridge and contributes towards the legibility of the historic railway.
- Water Trough (MVL3/21) is located c. 90m to the north of Wright's Mill Overbridge (MVl3/20). The water trough was established in the c. 1900 and was rebuilt in c. 2005 with a steel replacement. The water trough remains visible within the setting of the overbridge.

5.3.8 Midge Hall Underbridge (MVL3/19) and the Water Trough (MVL3/21) are located along the railway and contribute towards the legibility of the historic railway alignment. Though both structures have limited significance given that they been subject to unsympathetic works, their retention within the landscape and operational use as part of the contemporary railway network contributes towards the legibility of the historic railway.

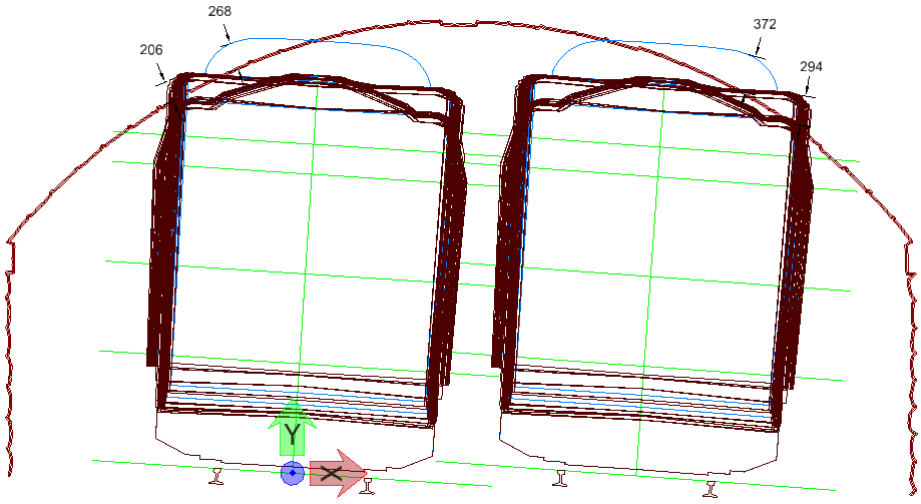
6. PROPOSALS

6.1 Background to proposals

6.1.1 In order to achieve the TRU Programme objectives of improving journey times, capacity, overall reliability and resilience, and delivering environmental benefits, the electrification of the railway line and achievement of increased line speed is required. This necessitates the installation of overhead lines along Route Section W2B.

6.1.2 Inadequate clearances to safely install OLE has been recognised as a challenge across much of TRU, preventing the installation of overhead lines below some existing overbridges. To reduce the requirement for intervention into the structures along the route as far as possible, a Scheme-specific pantograph has been developed which enables the use of reduced overhead line wire height under structures, subject to site-specific risk assessment. A number of structures along the route also do not provide adequate gauge clearance for the required freight trains on the route, the requirement for which has been considered as part of the design development process.

6.1.3 Insert 6-1 shows that even with use of the Scheme-specific pantograph, there would still be significant clash between OLE and Wright's Mill Overbridge (MVL3/20). Similarly, the bridge does not have the required freight gauge clearance. A process of design optioneering to identify the optimal solution has been undertaken.



Insert 6-1 Drawing showing the clash between existing structure and proposed pantograph level.

6.2 Design development and justification

6.2.1 Design development for Wright's Mill Overbridge (MVL3/20) has taken into consideration a number of factors including the significance of the listed structure, operational requirements and constructability. The design development process has also involved engagement with Historic England, TMBC and OMBC. This iterative and robust process ensured the rigorous exploration of available options, incorporating multi-disciplinary review and ongoing engagement with the heritage consultees.

6.2.2 Based on Network Rail's extensive experience delivering comparable schemes, six options were identified for further consideration. As introduced in 6.1, the option of retaining the structure without undertaking any works would prevent the delivery of the TRU Scheme. This option was therefore discounted at an early stage. The remaining five options comprised:

1. Track lower: lowering the height of the track to achieve the required headroom while retaining the existing bridge.

2. Bridge jacking: increasing the height of the bridge through structurally lifting the arch barrel up from the abutments. This would require diagonal cuts to be made to separate the arch barrel from the abutments, lifting the arch, infilling of the resulting gaps and refacing.

3. Bridge reconstruction: removal of the bridge arch and replacement with a deck providing sufficient clearance

4. Footbridge reconstruction: replacing the existing overbridge with a basic footbridge to meet Network Rail standards.

5. Bridge removal. Demolition of the existing bridge and divert the footpath/bridgeway from Midge Hill to the west to Calf Lane to the east.

6.2.3 A summary of the optioneering undertaken for these options is summarised in Table 6-1 Optioneering for Wright's Mill Overbridge (MVL3/20).

Table 6-1 Optioneering for Wright's Mill Overbridge (MVL3/20)

Option	Key Considerations	Advantages	Disadvantages	Preferred
1) Track lower	• Sufficient clearance needs to be achieved to enable electrification of the line and allow freight gauge clearance. • Time required working within the railway corridor is required to be minimised as far as possible to reduce risk to construction staff and the length of line possession (closure of the railway) and resulting disruption to railway service. • The bridge spans a railway cutting with a steep hillside on its eastern extent and is only accessible from narrow lanes and pedestrian/bridleway paths. This would restricts the accessibility of construction vehicles and the delivery of materials / components getting to the site. • Ground investigation has revealed rock to be present at shallow depth within the railway cutting. There is currently no functional track drainage at this location. • Lowering of ground level within the cutting has the potential to undermine the bridge foundations and cutting retaining walls or to necessitate significant engineering works to ensure their stability. • The designation of the bridge as a grade II listed structure places a requirement on Network Rail to have special regard for its preservation under the Planning (Listed Buildings & Conservation Areas) Act 1990.	• Lowering of the track would enable retention of the bridge with raising of the parapets undertaken prevent access to OLE.	• To achieve the required vertical minimum clearance of 4665mm, the track would have to be lowered by 500mm for a distance of 260m. Due to the shallow depth of rock at this location, this is a substantial engineering operation. • Underpinning of the bridge and stabilisation of the retaining wall would be required due to the shallow depth of their foundations. Underpinning may present risks to the listed building due to changes to the structural performance of the historic structure. • These interventions would require lengthy line possessions to remove the rock, underpin the bridge and stabilise the retaining walls. This would result in significant disruption to the railway and incur considerable public expenditure.	N
2) Bridge jacking		• This option would enable the retention of the listed bridge. The abutments, deck and parapet would be retained, although in altered form.	• Bridge jacking for masonry arch bridges is a relatively untested methodology, having been delivered on very few historic structures to date. The feasibility of jacking masonry arch structures relies on optimal site conditions, where a high level of control can be achieved and long timescales allowed for implementation. The long-term viability of this option is currently unknown.. • Bridge jacking would incur extensive disruption to railway users, requiring all works be delivered on site and little scope for off-site construction. • The location of the bridge over a cutting with limited access has significant limitations for execution of a bridge jacking operation. • Raising of the bridge arch would impact the form and appearance of the structure, interrupting architectural features such as the stringcourse and the stone coursing pattern across the parapet, detracting from its architectural value and integrity.	N
3) Bridge Removal		• Removal of the bridge would minimise disruption to the railway network and provide a cost effective solution	• This option would result in the complete removal of the bridge and the loss of a grade II listed structure. • Removal of the bridge would permanently remove road access between Midge Hill and Calf Lane and would necessitate the provision of new road access across the railway.	N
4) Footbridge replacement		• Reconstruction of the existing arch span with a basic footbridge to meet Network Rail standards which would enable continued use pedestrian use over the railway in this location. • Historic masonry can be reclaimed from removal of the bridge arch and parapets and reuse on the new footbridge aiding integration of historic and modern fabric and reduce the visual impact of the reconstruction works. • Reconstruction as a footbridge can be delivered substantially from track level. This would minimise the need for construction access by road at this constrained site.	• Reconstruction of the bridge would result in the loss of the historic bridge arch. Though a footbridge would be built in its place which would retain the historic alignment of the bridge this would not be a contributing element of the historic railway. • Would not be suitable to be used as a bridleway (which is its current use) given the narrow width of the standardised LMZ bridge form and the natural surface suitable for horses would also be removed. • Would result in a difference in form and legibility.	N
5) Bridge Reconstruction		• Reconstruction of the bridge would enable the preservation of some elements of the historic structure, through the retention and reuse of the bridge abutments in conjunction with the new bridge deck. • Historic masonry can potentially be reclaimed from removal of the bridge arch and parapets and reuse on the reconstructed structure aiding integration of historic and modern fabric and reduce the visual impact of the reconstruction works. • Reconstruction of the bridge can be delivered substantially from track level. This would minimise he need for construction access by road at this constrained site. • The installation of a preconstructed deck would minimise railway possession time and disruption to the railway network.	• Reconstruction of the bridge would result in the loss of the bridge arch and a portion of the parapets and abutments. This would result in the removal of a significant proportion of the historic bridge, substantially altering its form and appearance, and negatively impacting the integrity of the structure.	Y

6.2.4 Option 1 track lower, and option 2 bridge jacking would both have enabled retention of the maximum amount of historic fabric. However, these options were discounted due to the difficulty of delivering these at this constrained site and due to the significant cost and disruption required. Additionally, option 2 was also discounted given the uncertainties around the long term viability and largely untested nature of this method. Option 3 bridge removal was discounted on account of the negative impact on the significance of the listed overbridge, the equestrian and pedestrians users, as well as its group value. Option 4 footbridge replacement was discounted due to the impact on heritage significance as a result of the loss of the historic arch span and form. This option was also deemed unsuitable/unsafe for use as a bridleway given that the deck would be too narrow for equestrians and require higher parapet and natural surfacing. As such, Option 5 bridge reconstruction, was identified as the preferred option to achieve the required clearance of Wright's Mill Overbridge (MVL3/20). Whilst this option would result in significant alterations to the listed bridge, it was found to represent the most deliverable solution. This took into account the constrained nature of the site; the aims of the TRU Scheme; minimising disruption to the railway network and enabling retention of historic fabric as far as possible.

6.3 Development of Preferred Option

6.3.1 Design development was subsequently undertaken to mitigate as much as possible the potential impact of reconstruction on the heritage significance of Wright's Mill Overbridge (MVL3/20).

6.3.2 The sympathetic approach taken to bridge reconstruction during the restoration of the Huddersfield Narrow Canal prior to its reopening in 2001 was considered as a 'Reference Design'. The reconstructed masonry canal bridges are in proximity to Route Section W2B of the Transpennine route and successfully integrated reconstructed bridges within the historic character of the canal corridor. It was recognised by heritage stakeholders that the reconstruction of these canal bridges had successfully achieved designs which respond to the significance of the historic bridges.

Form of Replacement Deck

6.3.3 A number of constraints which had the potential to influence the feasible options for the replacement deck design were identified. These have shaped the choice of the form of the proposed replacement deck. These constraints can be summarised as follows:

- Geometric constraints

- Gauge clearance – the minimum distance of clearance required between the soffit of the deck and the proposed OLE.
    - Narrow deck width - the width of the deck is dictated by the bridge abutments and alignment of the highway.
- Construction constraints
    - Lift limit <30t – due to the layout of the site which has limited highway access and its constraints within a cutting, there is limited access for a large capacity crane at road level, therefore all bridge components are proposed to be delivered from the track and installed with use of a railway crane, with a maximum lift weight capacity of 30t.
- Minimisation of disruption to pedestrians and bridleway users .
    - Minimisation of disruption to railway users caused by railway line closures. Shift hours are limited by the window within which work can be safely completed while minimising impact on railway users.

6.3.4 Three forms of bridge deck were considered as potential options for the reconstruction of Wright's Mill Overbridge (MVL3/20):

- Network Rail standard Conarch.
- Portal deck; and
- Filler beam construction.

6.3.5 These are presented in the Table 6-2 below.

Table 6-2 Summary of bridge deck design optioneering

Option	Assessment	Preferred	Indicative Photo
1 – Standard Conarch	A standard Conarch is a portal bridge consisting of standardised precast concrete frames which conform with Network Rail's specification. Where the specification requirements are met, these precast units can be transported to site and installed quickly and efficiently to form a portal overbridge, with deck cast *in-situ* to form a continuous structure. The use of standardised Network Rail Conarch bridge (precast concrete arch) is not considered feasible at this site and was discounted at an early stage, primarily due to its geometric constraints. The required narrow deck and retention of the alignment of the footpath would not allow Network Rail technical standards to be met. The lifting capacity limitations due to the use of a railway crane also discounted the use of standard Conarch edge beams due to their weight.	N	
2 – Portal	A portal bridge consists of a series of precast concrete frames which are then transformed to site and installed, with deck cast *in-situ* to form a continuous structure. Unlike a standard Conarch, portal bridge can be designed to bespoke dimensions, allowing site specific geometry to be accommodated. A portal would accommodate site geometry and its form would to a degree reference the form of the existing arch form. However, lift weight limitations and the requirement for a separate parapet beam for this option would impact the level of the bridleway and reduce verge width. The portal would result in a larger area of visible concrete, reducing the degree to which they could be sensitively integrated with the retained masonry elements of the structure. Portal structures would also require bespoke beam design at each site, reducing standardisation between the proposed new bridge decks on Route Section W2B, increasing costs of the publicly funded works.	N	
3 – Filler beam	A filler beam deck consists of a concrete slab with longitudinal reinforced steel beams. This form of construction accommodates site geography, minimises the required lift weights, maximises the extent of works that can be undertaken off-site, and standardises the beam design between sites. The potential standardisation offered by sympathetically integrated filler beam decks along Route Section W2B would maintain a degree of consistency of design between the structures. This consistent design response to the challenge of electrifying the route could be viewed as part of the next chapter for the management of this section of the Transpennine route.	Y	

6.3.6 The filler beam deck was selected as the preferred design option, and further consideration was given to ensuring the proposed works would be sympathetic to the existing aesthetic of the structure.

6.3.7 In order to visually integrate the proposed precast concrete riser unit with the retained masonry abutments, it is proposed to clad their external faces with natural stone. The underside of the new deck would not be clad, the benefit of cladding this element would be extremely limited given the lack of visibility of the underside of the deck. Cladding would also present a number of safety risks namely, the introduction elements that may fall onto the railway corridor should they fail over time, the obscuring of critical structural elements that require routine inspection, and the introduction of an additional construction activity that would be undertaken at height and within the railway corridor. Similarly, it is proposed that the new filler beam deck includes a feature line which would tie in with the stringcourse of the existing structure. These integrated design elements respond to specific features of the existing structure that contributes to its character and architectural interest.

Parapet design

6.3.8 The new parapet design required a height of 1.8 m given that the overbridge remains in active use by pedestrians and horse riders and would need to adhere to Network Rail's safety standards whilst responding to the significance of the existing bridge. Numerous options for the proposed new parapet design were considered, these options are summarised in Table 6-3.

6.3.9 Further optioneering was then undertaken to identify a suitable material for the bridge copers, as set out in Table 6-4.

Table 6-3 Summary of parapet design options

Option	Core	Road Facing Elevation	Track Facing Elevation	Assessment	Preferred	Indicative photo
1	Concrete	Concrete with liner finish	Concrete with liner finish	• Pre-cast concrete parapet with exposed concrete liner on both sides of parapet. • This option would not be considered to result in a sensitive addition, with extensive amounts of concrete visible in views of and across the bridge.	N	
2	Concrete	Natural stone cladding	Concrete with liner finish	• Pre-cast concrete parapet with exposed concrete liner on track facing elevation and stone cladding installed to highway-facing elevation. • This option would not be considered to result in a sensitive addition, with extensive amounts of concrete visible in views of the bridge.	N	
3	Concrete	Reclaimed stone cladding (as far as possible), newly quarried natural stone cladding where required	Natural Stone cladding	• Pre-cast concrete parapet with natural stone pre-cast into track-facing parapet off-site and natural stone cladding installed on bridleway side. Stone reclaimed from the existing bridge could be used to clad footpath-facing elevation as far as reasonably practicable. • This option is considered to represent the optimum balance between constructability, safety and a design sensitive to the significance of the structure.	**Y**	
4	Steel framework	Natural stone	Natural stone	• This option comprises natural stone blocks built up in courses with joints reinforced by a stainless steel framework which is cast into the concrete edge beam. • Due to the time limitation and safety implications of working in an active railway corridor coupled with the minor difference in appearance between Option 3 and 4, this option has not been progressed.	N	
5	Masonry	Rebuilt from original stone	Rebuilt from original stone	• Due to the time limitation and safety implications of working in an active railway corridor coupled with the minor difference in appearance between Option 3 and 5, this option has not been progressed. The quantity and quality of the stone able to be reclaimed from the site is also considered a limiting factor.	N	

Table 6-4 Coping stone optioneering

Option	Advantages	Disadvantages	Indicative image	Preferred
Option 1 – Natural Stone	• Natural stone would be sympathetic to the historic character of Wright's Mill Overbridge (MVL3/20), in keeping with its architectural interest. • Natural stone copers would represent an honest intervention, with the form of the stones readable as a response to the electrification challenge, while sympathetically integrating with the existing and historic character of the bridge. • Over time, this material would weather to further integrate with the existing and proposed masonry elements.	• Natural stone is the heaviest of the three options with a density of 25 kN/m3, requiring consideration in the design of the structural elements of the parapet units and connection with deck. • The weight of natural stone also requires special consideration be given to manual handling safety protocols. • This option is determined to be the most expensive of the three options due to costs for quarrying and fees for masonry contractors.		**Y**
Option 2 – Coloured Concrete	• Lighter material than natural stone with a density of 18 kN/m3. • Concrete can be coloured to achieve a close visual match to the adjacent masonry coping stones • This material would weather over time, increasing the similarity in appearance between coloured concrete and the existing masonry • Coloured concrete copers would be relatively cost effective, reducing the cost of this publicly funded project	• Introduction of modern material, would represent a departure from the materials historically used for coping stones. • While relatively sympathetic this material would risk negatively impacting on the architectural interest of the Wright's Mill Overbridge (MVL3/20).		N
Option 3 – Glass Reinforced Plastic (GRP)	• Lighter material than natural stone. • Cost effective material, reducing the cost of this publicly funded project.	• There would be a stark visual disparity between the GRP copers and historic fabric, detracting from the architectural interest of Wright's Mill Overbridge (MVL3/20). • GRP copers would not weather or soften in the way natural stone or concrete would, with the difference in material continuing to detract from the character of the historic bridge. • Of the options considered, GRP copers would result in the highest level of harm to the character of the bridge		N

6.3.10 Option 3 parapet design presented in Table 6-3 was selected as the preferred option and progressed to design given that it would ensure the proposed parapets visually integrate with the retained elements of the existing bridge, while enabling a degree of off-site construction and has been progressed to detail design. This approach would realise safe working for operatives constructing the Scheme at this location by avoiding working at height over the railway line. It would also successfully reduce the time required for line possession compared to other options, thereby minimising disruption to railway users. This option also presents the opportunity to use reclaimed stone on the bridleway-facing elevations where possible, which would to a degree, mitigate adverse impacts arising from the work.

6.3.11 Option 1 – Natural Stone was determined as the preferred option for the coping stones. As summarised in Table 6-4, the specification of natural stone copers would contribute to the high-quality finish forming one of the factors embedded into the design which partially mitigates against the high level of harm arising from reconstruction. The use of natural stone copers and cladding would provide visual consistency for the reconstructed span and help to integrate the retained masonry structure with the proposed new span.

6.3.12 The recommended minimum parapet height required for bridleway bridges over electrified railway is generally 1.8 m. Whilst deviation from this standard can be achieved based on a site-specific risk assessment, due to the narrow width of Wright's Mill Overbridge (MVL3/20) and the height of horse riders crossing the bridge, a parapet height of 1.8 m has been identified to be required at this structure to ensure the safety of bridge users.

6.3.13 During removal of the existing arch, retention of historic fabric will be maximised as far as possible. Masonry reclaimed from the removal of bridges along the W2B Route will be assessed for its suitability for reuse as cladding.

6.4 Description of proposals

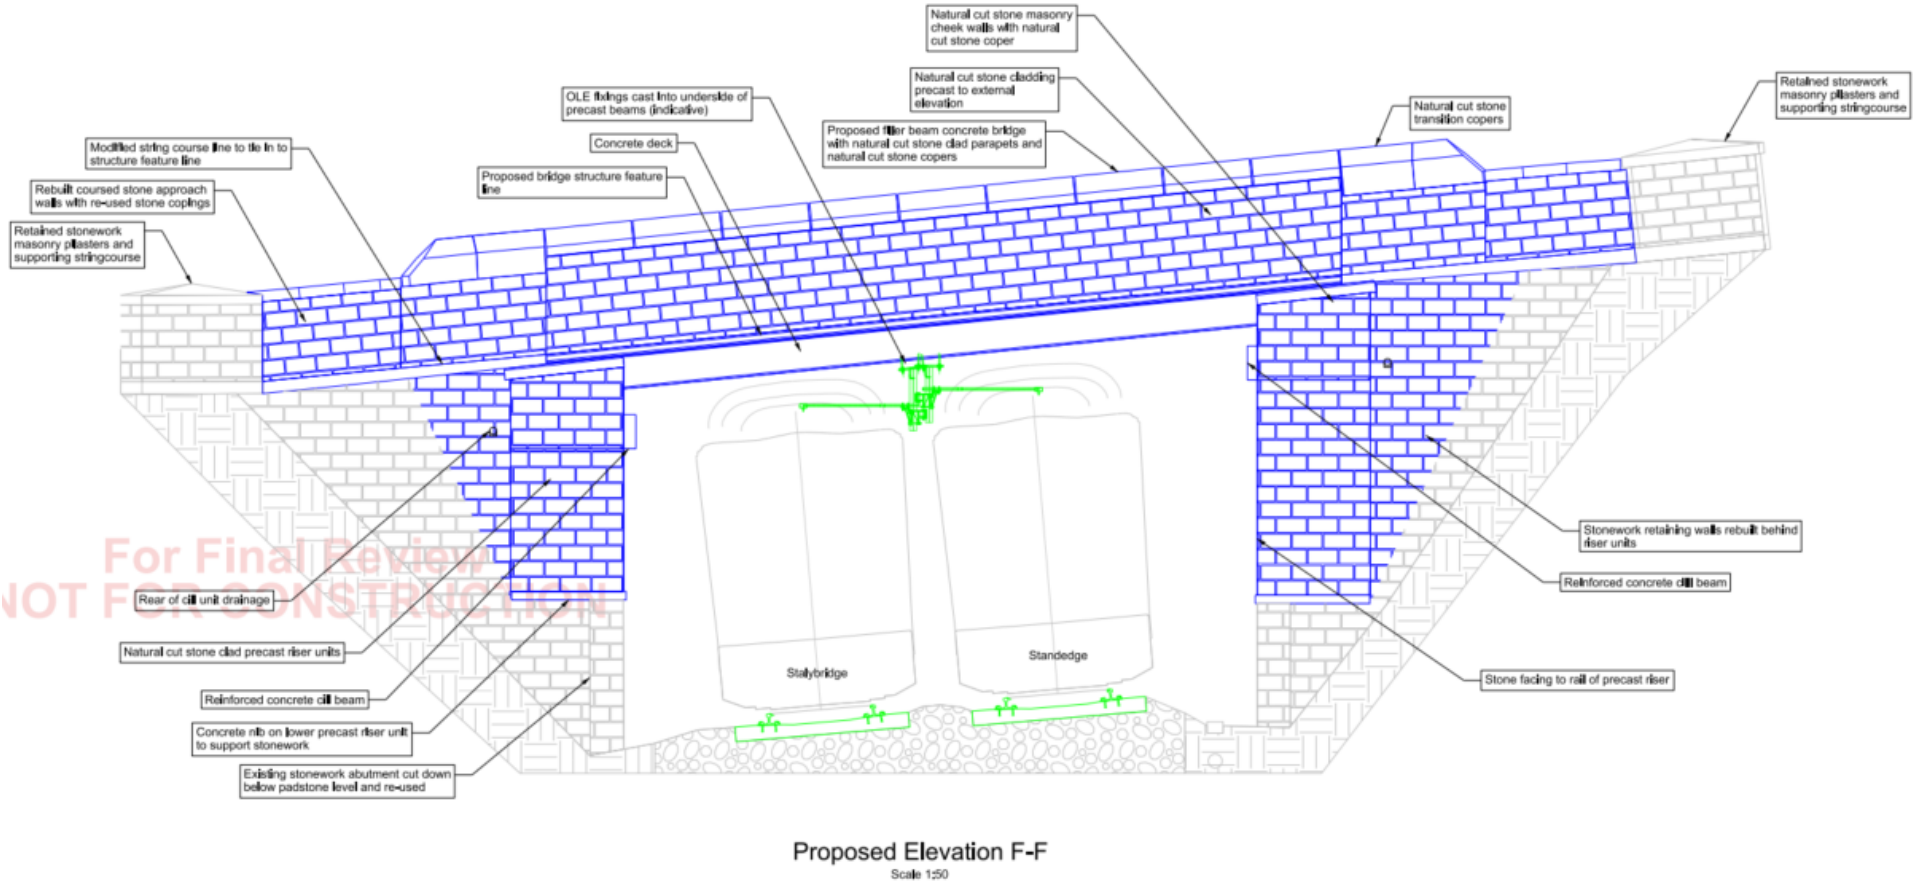
6.4.1 It is proposed to remove the existing deck, parapet and arch span of the grade II listed Wright's Mill Overbridge (MVL3/20) and reconstruct the bridge using a new filler beam span, with both the new parapets and structural elements designed in a style which responds to the architectural significance of the existing historic structure.

6.4.2 Removal of the existing masonry deck, arch and parapet would be undertaken, minimising the extent of demolition as far as possible and retaining any suitable fabric for reuse as far as possible.

6.4.3 The reconstructed bridge would consist of retained masonry abutments beneath the level of the existing impost bands, above which natural stone-clad precast concrete risers would be installed to support the stonework. A concrete filler beam deck would be installed on bearings supported by a concrete cill beam. The deck slab would be cast in-situ using permanent formwork situated between weathering steel bottom flanges of the new steel beams. The precast concrete edge beams of the replacement deck would have integral parapets clad with natural stone with natural stone copers. The external parapet elevation would be clad off site with natural stone masonry cast into its fabric. The internal elevation will be clad with masonry in-situ using stone reclaimed from the existing historic bridge as far as reasonably practicable. Two electrification hazard signs would be attached to the inside face of each parapet, along with a bridge strike sign. External and internal elevations of the parapet would match the colouring, size and coursing pattern of the existing fabric as far as possible. The edge beam design also includes a horizontal feature line which will tie in with the modified and retained existing string course. The footpath would be resurfaced using a granular material.

Insert 6-2 Visualisation of Wright's Mill Overbridge (MVL3/20) looking across the bridge deck.

Insert 6-3 Visualisation of Wrights Mil Overbridge (MVL3/20) from aerial perspective



Insert 6-4 Proposed Elevation Wright's Mill Overbridge (MVL3/20)

Construction Methodology

6.4.4 The proposed works relating to the reconstruction of the overbridge would comprise:

- Locally break down approach walls and excavate behind deck ends in advance of demolition.
- Careful demolition of the existing masonry arch span by removing the masonry arch and cutting down the abutment to underside of springing stone level.
- Reclamation of historic masonry as far as possible with transportation and secure storage at the site construction compound. Stone will be subject to preliminary rapid assessment for potential reuse and then palletised ready for transportation back to site where it will be redressed and used as appropriate.
- Installation of new bridge elements including precast riser units, cill units, bearings, with materials transported to site by rail.
- Install prefabricated beam pair sections for filler beam deck, including edge beams with integral parapets.
- Cast in-situ concrete between beam pairs and topping slab for the bridge deck.
- The stone wingwalls and approach walls will be rebuilt where taken down locally to enable removal of the deck,
- Install deck waterproofing and protective finishes.
- Build in situ stone-facing to interior of the parapets using reclaimed stone as far as possible and install coper units.
- Backfill with engineered fill behind the structure and on approaches up to underside of footpath formation.
- The approach stone walls will be rebuilt, stone copers installed. and the new footpath will be surfaced.

6.4.5 The proposed works to Wright's Mill Overbridge (MVL3/20) are shown in the following drawings which accompany this application:

- Existing and Proposed Plan (167037-TGP-25-MVL3-DRG-T-LP-162013)
- Existing and Proposed Elevation and Section (167037-TGP-25-MVL3-DRG-T-LP-162014)
- Existing and Proposed Elevation and Section (167037-TGP-25-MVL3-DRG-T-LP-162015)

- Existing and Proposed Elevation and Section (167037-TGP-25-MVL3-DRG-T-LP-162016)

7. IMPACT OF PROPOSALS

7.1 Wright's Mill Overbridge (MVL3/20)

7.1.1 The proposed works to the grade II listed Wright's Mill Overbridge (MVL3/20) are required in order to accommodate electrification of the Transpennine route as part of the wider TRU Programme. In order to construct the Scheme, the proposed works would require the removal of most of Wright's Mill Overbridge (MVL3/20) and its reconstruction. This will result in the loss of the majority of the structure, with the extent of retained fabric confined to the abutments, portions of the wingwalls, and pilasters at each end of the bridge parapets.

7.1.2 The proposed works would largely erode the historic and architectural value of Wright's Mill Overbridge (MVL3/20) through its substantial removal. The proposed works would retain the pilasters and portions of the wing wall abutments, maintaining an isolated element of the structure's overall architectural interest, however, their context as part of a little altered structure would be lost.

7.1.3 The proposed intervention will mean the substantial removal of a historic bridge that is part of the infrastructure associated with the Heroic Age (1841-50) of railway construction. It is not only a loss in its own right but also detrimental to the historic character and group value that this structure contributes to as part of the Transpennine railway line.

7.1.4 The proposed reconstruction of the structure would have an impact on the group value of the bridges designed by A.S. Jee on the Transpennine route. The loss of Wright's Mill Overbridge (MVL3/20) would remove one element of this group of 18 bridges designed by A.S. Jee and one of the five bridges which share a common design language. Given that these bridges derive a degree of significance from their group value with each other, the significance of each of the other bridges will therefore be slightly diminished by the removal of Wright's Mill Underbridge (MVL3/20). The impact of these demolitions would amount to less than substantial harm to the retained structures arising from a weakening of the extent to which group value contributes to their significance.

7.1.5 These proposals would therefore result in substantial harm to the significance of Wright's Mill Overbridge (MVL3/20). The development of the design has embedded details to mitigate against this harm wherever possible. Reclaimed masonry cladding and

natural stone copers would visually integrate the new fabric of the proposed deck and parapets with the retained pilasters and approach walls. This consistency of material and finish will reduce the degree to which the proposed change is experienced when moving across the bridge and would realise an opportunity for the sustainable reuse of historic fabric on the reconstructed bridge. Similarly, the inclusion of a stringcourse detail in the proposed concrete edge beam would visually integrate the new structural element with the altered masonry stringcourse. The level of harm arising from the works would remain as substantial, but the careful consideration given to the visual relationship between the proposed and existing elements of the structure would to a small degree offset the potential harm to Wright's Mill Overbridge (MVL3/20).

7.2 Other heritage assets

7.2.1 The proposals would have no direct physical impact on the designated and non-designated assets within the 250m study area around Wright's Mill Overbridge (MVL3/20). Though the reconstruction of the bridge would result in a, albeit minor, change in the setting of 7, 9, 11 and 11A Midge Hill (grade II, NHLE 1162827), such change would not have an appreciable impact given intervisibility is minimal and the bridge would continue to provide bridleway/pedestrian access.

7.2.2 The reconstruction of Wright's Mill Overbridge (MVL3/20) would impact the settings of the non-designated assets of Midge Hall Underbridge (MVL3/19) and the Water Trough (MVL3/21), detracting to a limited extent the legibility of the historic railway in relation to these assets.

7.3 Mitigation

7.3.1 Design proposals were developed through an iterative process which has robustly sought to avoid or reduce the impact on the significance of Wright's Mill Overbridge (MVL3/20). Additional information with respect to these elements of design development is included above in Section 6.2.

7.3.2 Regular consultation with historic environment stakeholders and the design team were held throughout the new bridge's design development process (see Section 4). Historic environment stakeholders, including Historic England, OMBC and TMBC, have been involved in the development of the design mitigation described below.

7.3.3 The design development process has resulted in mitigation being embedded within the design of reconstruction of Wright's Mill Overbridge (MVL3/20). The following design considerations have

been taken into account in response to the magnitude of proposed alteration:

- The use of natural stone cladding to minimise the areas of visible concrete, reflecting the materiality of both the original bridge and many of the other retained structures along the Transpennine route. This approach would ensure natural stone remains the dominant material of the exterior faces of the bridge.
- Salvaged stone from the demolished span will also be considered for reuse on the bridleway-facing elevations of the parapet where feasible.
- The proposed feature line in the precast edge beam would help integrate the newly inserted concrete beam with the portions of string course on the retained pilasters.
- A common approach has been taken to the design of both bridge reconstructions of Heyrod Hall Overbridge (MVL3/7), Wright's Mill Overbridge (MVL3/20) and Oldham Road Overbridge (MVL3/28). It is considered that progressing comparable designs in tandem would enable a coherent approach and would provide a visible reference to the new phase of design upgrades taking place in the 21st century. This is another chapter in the story of the railway's development and improvement.

7.3.4 During construction of the works, toolbox talks to disseminate best practice for reducing potential impacts in relation to construction activity associated with Wright's Mill Overbridge (MVL3/20) would also be delivered, for example to help avoid accidental damage.

Recommended Compensation

7.3.5 In addition to these embedded measures, additional mitigation secured through the use of listed building consent conditions is recommended comprising:

- A scheme of historic building recording to Level 3 standards in accordance with Historic England guidance (Historic England 2016). This would provide a permanent record of Wright's Mill Overbridge (MVL3/20) in its current form and be lodged with the Greater Manchester Historic Environment Record. This building recording would help to compensate for the harm to significance resulting from the demolition by providing the opportunity to document the structure which will be largely lost as a result of the proposed works. The historic building recording would include:
    - Drawings.

  - Photography.
  - Written account.

- A scheme of permanent heritage interpretation would be developed and installed adjacent to Greenfield Station. This would provide the opportunity to engage members of the public with the heritage of the Huddersfield & Manchester Railway including the historic structures designed by A. S. Jee, such as Wright's Mill Overbridge (MVL3/20). Further engagement with stakeholders with respect to the content of the interpretation would be undertaken during the detailed design phase.

7.4 Public benefit

7.4.1 The reconstruction of Wright's Mill Overbridge (MVL3/20) and resulting substantial harm is considered justified to ensure the realisation of the substantial public benefits of the Order Scheme, in accordance with paragraph 214 of the NPPF.

7.4.2 As part of the wider TRU Programme, the Order Scheme would directly and indirectly play a role in improving regional connectivity and enhancing of some of Britain's busiest rail network, in turn realising economic, social and environmental objectives of the programme. The Transpennine route is identified as a key transport corridor, providing connections between cities in the North of England. The improvements in connectivity delivered by the TRU programme will support aspirations for economic growth and "levelling up" opportunities across the North of England.

7.4.3 The key objectives of the TRU programme are to achieve the part electrification of the Transpennine Route, improve journey times and capacity between key destinations, improve overall reliability and resilience of the route, and provide environmental benefits from modal shift from road to rail freight reducing the number of heavy vehicles on the highway network and associated air pollution. The reconstruction of Wright's Mill Overbridge (MVL3/20) would directly facilitate the achievement of these aims by creating sufficient clearance beneath the bridge to accommodate electrification and the use of larger gauge trains, delivering increases in line speed, capacity and resilience.

7.4.4 Electrification would deliver faster journey times and improved performance by allowing trains to accelerate faster, and brake more efficiently. The Order Scheme will deliver faster line speeds (80 mph throughout), improving journey times along the Transpennine Route, aiming to provide an improved journey time from Leeds – Manchester Victoria of 42-44 minutes and York to Manchester Victoria of 65-67 minutes. Works to the track and structures along

the Route, including reconstruction of Wright's Mill Overbridge (MVL3/20), are required to accommodate this increase, and without these changes the Scheme would be unable to go ahead.

7.4.5 As a vital constituent part of the Order Scheme, the proposed reconstruction would also facilitate indirect benefits associated with the wider programme of works, including station upgrades, track renewal and signalling improvements.

7.4.6 The reliability and resilience of the route and services operating on it will be improved by replacement of existing infrastructure with electrification equipment, new track drainage and signalling. Modern signalling equipment will reduce the headway between trains, allowing them to run closer together which will in turn provide increased capacity. The Scheme will provide the capability to operate four 'express', two 'semi-express' services and up to two local services an hour on the Route and will provide increased flexibility to timetable more train paths.

7.4.7 Electrification of the Scheme would provide substantial environmental and sustainability benefits and is an investment in 'greener' energy technology. This supports Network Rail's Decarbonisation Strategy and is bolstering national targets for reducing harmful emissions that cause climate change, which are set out in Government legislation for achieving net zero carbon by 2050.

7.4.8 The Order Scheme will also deliver improved safety through measures including replacement of two level crossings, installation of additional safety measures on existing bridges; enhancements to the local highway networks and new pedestrian crossing points at locations including Greenfield and Mossley Stations. Accessibility of the railway network will also be improved with the provision of fully accessible stations at Greenfield Station and the relocated Mossley Station. These measures are being brought forward as part of the wider TRU Scheme to electrify and modernise the Route, as facilitated, in part, by the reconstruction of Wright's Mill Overbridge (MVL3/20).

7.4.9 Significant residual beneficial effects arising from the operation of the wider TRU Scheme have been previously identified in the Huddersfield-Westtown TWA Order Inquiry from December 2021. These included recognition of improved journey times, reliability, and capacity at the Local Authority area and in turn the sub-regional and regional level. These improvements will bring direct significant benefits to local businesses and the labour market through improved access to the local regions along the section of the route from Stalybridge to Diggle.

7.4.10 To this effect, the proposals at Wright's Mill Overbridge (MVL3/20) are therefore essential in achieving the overall substantial public benefits of Route Section W2B and wider objectives of the Order Scheme, and without these interventions, the Order Scheme would not be able to be safely and successfully implemented. Alongside these substantial public benefits, the delivery of heritage interpretation adjacent to Greenfield Station would enable public engagement with the heritage of the Huddersfield & Manchester Railway, its architecture and significance.

8. CONCLUSION

8.1.1 The significance of Wright's Mill Overbridge (MVL3/20) lies primarily in its historical and architectural interest. The bridge is a largely unaltered example of a masonry underbridge dating to the Heroic Age (1841-1850) of railway building. The high quality of the bridge's architecture together with the quality workmanship of the construction is characteristic of A.S. Jee's work for the Huddersfield & Manchester Railway. The bridge also derives significance from this direct historical relationship with notable railway engineer A.S. Jee and the historic railway companies namely the Huddersfield & Manchester Railway and LNWR. The setting of Wright's Mill Overbridge (MVL3/20) makes a minor contribution to the significance of the structure. It also possesses group value as one of a number of A.S. Jee structures on the Transpennine route which share a common design language.

8.1.2 A number of design options were pursued to achieve the clearance required for the OLE. The OLE is a fundamental part of the Scheme to deliver a faster service (reduced journey time) and to make provision for electrification and the operation of a 'greener' transport solution. The development of a Scheme-specific pantograph which enables the use of reduced overhead line wire height under structures, subject to a site-specific risk assessment, has not resolved the clash between proposed OLE and the listed structure.

8.1.3 The first range of options were focused on the retention of the bridge and employing engineering solutions to facilitate the Scheme within the current physical confines of the structure. These options included:

- Adjusting the vertical rail alignment through track lowering to provide adequate clearance for the required OLE through the arch of the structure;
- Bridge jacking to increase the height of the arches over the lines to provide sufficient clearances; and

- Footbridge reconstruction with a basic footbridge to meet Network Rail standards, maintaining pedestrian access over the railway in this location.

8.1.4 However, as outlined in Section 6.2, these options did not meet with safety regulations, operational drivers and buildability. Local geology, topography, requirements of the bridleway and access constraints limit the feasibility of delivering the other options considered within the context of the operational railway corridor.

8.1.5 Options were then pursued which accepted the loss of the historic bridge and made attempts to achieve an optimum reconstructed bridge design solution that retained the relationship with the railway and to an extent compensated for the removal of the existing structure. This was done through material choices (use of natural stone cladding referencing the character of the existing bridge); ambition to salvage masonry from the demolished span for use to clad elements of the reconstructed bridge, formation of a horizontal feature line in the concrete edge beams to tie in with the retained section of stringcourse.

8.1.6 The design process has been undertaken in a strongly collaborative manner and has sought historic environment professional support from the outset. The desire to maximise heritage benefits and limit harm was the primary position. Every effort was made to retain this historic structure as part of TRU. However, this was unachievable within the operational parameters set. Regular consultation with historic environment stakeholders and the design team were held throughout the design development process and several mitigation measures have been considered to attempt to avoid or reduce the impact on the significance of Wright's Mill Overbridge (MVL3/20). Historic England, TMBC and OMBC have accepted that the approach of reconstructing the structure is necessary to deliver the proposed Scheme, and that alternative approaches are not viable. The design development process, including engagement with historic environment stakeholders, resulted in mitigation being embedded within the design of the reconstruction as well as compensation measures being agreed, to be secured as conditions of the LBC (see Section 7.3).

8.1.7 With the reconstruction of Wright's Mill Overbridge (MVL3/20), the Scheme can achieve key improvement objectives as outlined in Section 7.4. It would also support the achievement of substantial public benefits related to:

- Improved efficiency and reliability of the railway (in journey time saving and increased capacity);
- Reduction of delays to trains and other highway users (improved efficiency of the railways means fewer heavy

vehicles on the highway network causing traffic issues and contributing to air pollution);

- Supporting sustainable transport development in line with Network Rail's Decarbonisation Strategy; and
- Improving public health and safety in providing safe routes across the railway.

8.1.8 In addition to this, the delivery of a programme of heritage interpretation at Greenfield Station would provide the opportunity for engagement of the public with the heritage of the Huddersfield & Manchester Railway.

8.1.9 The substantial loss of Wright's Mill Overbridge (MVL3/20), which is a grade II listed building, would result in substantial harm to the significance of the listed building and should be considered exceptional. This will mean the loss of an irreplaceable piece of railway infrastructure, dating to the Heroic Age (1841-50) of railway building. It is also a loss to the collection of A.S. Jee bridges that are located along this section of the Transpennine route.

8.1.10 Whilst the reconstruction of Wright's Mill Overbridge (MVL3/20) is regrettable its loss would be outweighed by the substantial public benefits that accrue from enabling the Transpennine programme to be achieved. The proposals therefore meet the requirements of the NPPF (paragraph 214) in relation to the justification for substantial harm, complies with policy C5 of the Tameside Unitary Development Plan and policy 24 of the Oldham Joint Core Strategy and Development Management Policies. It would also satisfy Policy JP-P2 contained within Greater Manchester Combined Authority's Places for Everyone (2024). The proposals therefore satisfy both national and local policy requirements in relation to the justification for harm to the significance of Wright's Mill Overbridge (MVL3/20).

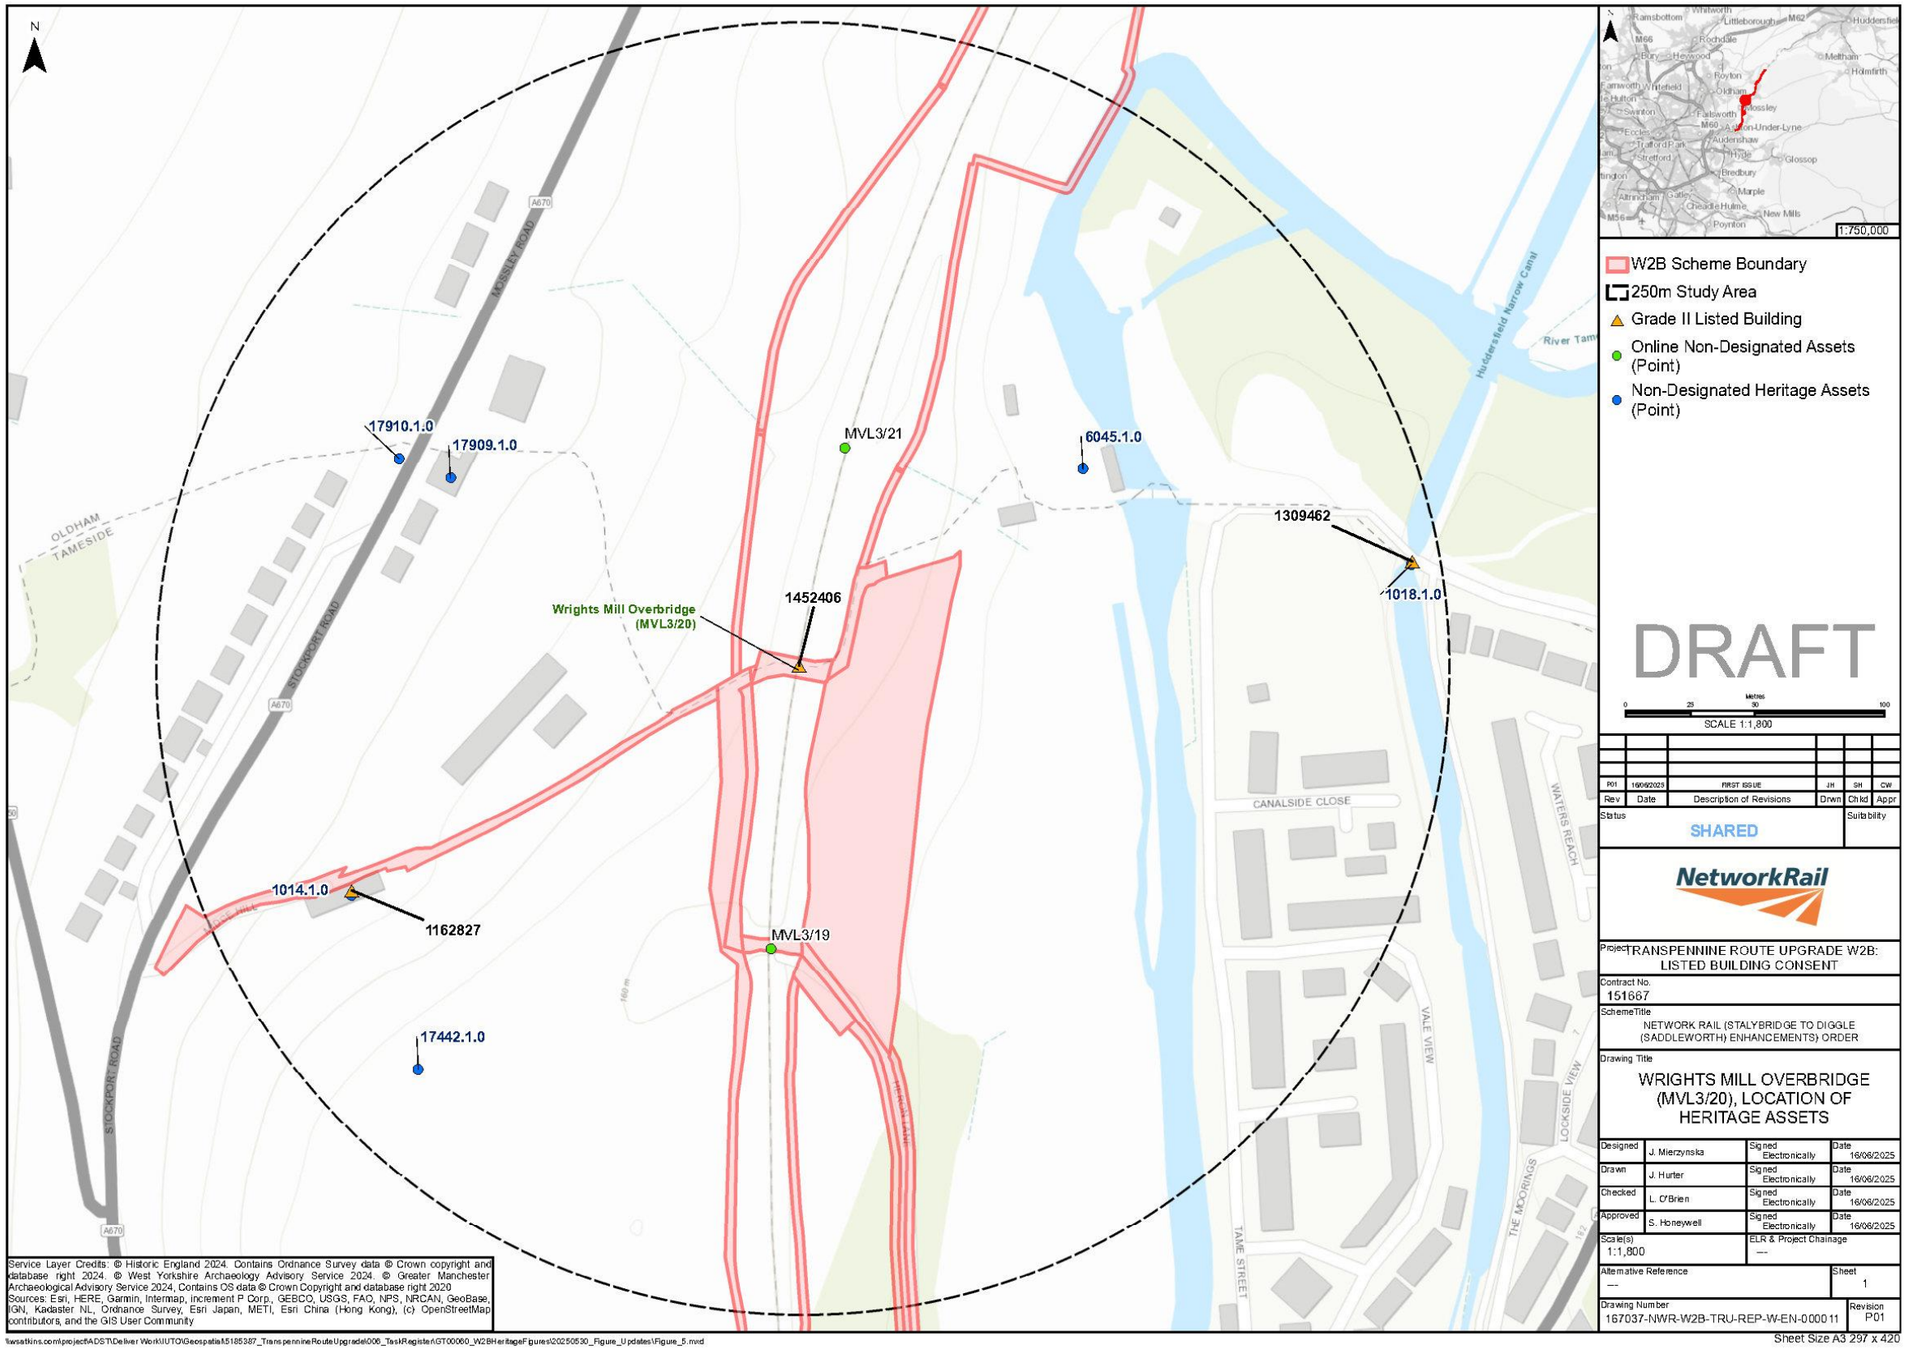
APPENDIX A – LOCATION PLAN



APPENDIX B – NATIONAL HERITAGE LIST DESCRIPTION

Official list entry

Heritage Category:	Listed Building
Grade:	II
List Entry Number:	1452406
Date first listed:	23-Mar-2018
List Entry Name:	Railway overbridge MVL3/20, Wright's Mill
Location Description:	Footpath from Midge Hill Farm to Calf Lane, Mossley.

Location

The building or site itself may lie within the boundary of more than one authority.

District:	Oldham (Metropolitan Authority)
Parish:	Saddleworth
District:	Tameside (Metropolitan Authority)
Parish:	Mossley
National Grid Reference:	SD9786003652

Summary

Railway overbridge, 1845-1849, by AS Jee for the Huddersfield & Manchester Railway.

Reasons for Designation

Wright's Mill Bridge (MVL3/20), constructed in the mid-late 1840s by AS Jee for the Huddersfield & Manchester Railway, is listed at Grade II for the following principal reasons:

Historic interest:

* constructed during the heroic age of railway building and a little-altered example of an 1840s overbridge on what is now one of the main railway lines in northern England;

* designed by the notable railway engineer Alfred Stanistreet Jee.

Architectural interest:

* the bridge is well-detailed with ashlar impost bands and string course, and piers and voussoirs with tooled margins, that lift its design above the purely functional.

Group value:

* with the other listed structures designed by Jee on the Huddersfield & Manchester Railway line.

History

In contrast to the main trunk lines of the late 1830s that were constructed by single railway companies the route from Stalybridge to Leeds had fragmented origins and was the work of three different railway companies: the Huddersfield & Manchester Railway, Leeds, Dewsbury & Manchester Railway, and the Manchester & Leeds Railway.

The Huddersfield & Manchester Railway was authorised in 1845 and followed the route of the Huddersfield Narrow Canal for much of its length, including a railway tunnel through the Pennine hills set alongside the earlier Standedge Canal Company tunnel of 1811; in 1846 the railway company also acquired the canal. Joseph Locke and Alfred Stanistreet Jee were appointed to survey and design the new line, the two engineers having already worked together on a major project linking Manchester and Sheffield. Jee became the lead engineer for the Huddersfield line, which passed through challenging terrain, assisted by resident engineers that included his brother Moreland Jee (until 1848) and Herbert F Mackworth. Construction of the line was divided into various contracts, with many contractors being only responsible for a single cutting, viaduct or tunnel portal. The largest contract for the Standedge Tunnel between Diggle and Marsden was let to a single contractor, Thomas Nicholson in 1847. The tunnel's completion in 1849 marked the opening of the line.

The Leeds end of the route, which was also authorised in 1845, was constructed by the Leeds, Dewsbury & Manchester Railway. The engineer was Thomas Grainger who had previously largely worked in Scotland, and the line was completed in 1849.

A short three-mile section of the route between Heaton Lodge Junction and Thornhill Junction near Mirfield was developed by the Manchester & Leeds Railway and was constructed between 1837 and 1840, with George Stephenson as the chief engineer. The structures on this line were designed by Thomas Gooch under the oversight of Stephenson. In 1847 the railway company changed its name to the Lancashire & Yorkshire Railway.

In 1847 the Huddersfield & Manchester Railway and the Leeds, Dewsbury & Manchester Railway were acquired by the London & North Western Railway (LNWR) so that the company could access the city of Leeds and the textile towns of West Yorkshire. This pitted them as rivals to the Lancashire & Yorkshire Railway, although at points on the route the two companies had to work together. By 1851 the London & North Western Railway had an overall mileage of railway track of 800 miles and it became the most prominent railway company in the country and the largest joint-stock concern in the world in the late C19. Although the LNWR had a general manager, Captain Mark Huish, the lines of the Stalybridge to Leeds route still managed their own affairs. LNWR later carried out expansion works, including the widening of tracks and bridges, the construction of additional tunnels, and station alterations. In 1923 the line became part of the London Midland & Scottish Railway, and subsequently part of the nationalised British Railways in 1948. The line, its

structures and track are currently (2018) owned by Network Rail, and the passenger services operated by TransPennine Express and Northern Rail.

This overbridge was built to carry the footpath from Midge Hill Farm to Wright's Mill over the railway. It was designed by AS Jee (1816-1858) and dates from the line's construction between 1845 and 1849. It remains as built.

Details

Railway overbridge, 1845-1849, by AS Jee for the Huddersfield & Manchester Railway.

MATERIALS: buff sandstone.

DESCRIPTION: the bridge carries the footpath from east-west across the railway. Due to gradients it slopes down towards the east. The bridge comprises a single segmental-arched span recessed between battered abutments to either side of the steep cutting, with a parapet.

The stonework is regular-coursed and quarry-faced. The stone of the arch piers and the voussoirs has tooled margins, the keystone breaking the arch above and below. The impost bands, sloping string course above the arch and the chamfered-and-weathered parapet copings are dressed. The abutments curve outwards slightly at all four corners and terminate in slender piers with shallow, pyramidal caps. The arch soffit is narrow-coursed masonry with tooled detailing. The road surface was much overgrown at the date of survey (2017).

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the pre-application meetings over the last five months. These have been extremely useful in explaining the significance of the heritage assets, the design team's approach, and in exploring issues and constraints associated with electrifying the track.

This letter covers our advice regarding proposals for change to eight listed railway structures between Stalybridge and Standedge Tunnel, within the Metropolitan boroughs of Tameside and Oldham in Greater Manchester. This section of the railway is referenced as W2B.

Significance

The section of railway between Stalybridge and Standedge Tunnel was constructed in stages between 1844 and 1849. This was at the height of "railway mania"; an intense period of activity when many competing companies formed and were racing to complete sections of railway. The Stalybridge and Standedge Tunnel railway eventually became part of a wider network of sections of track that extends from Selby and York to Manchester Victoria via Leeds.

The W2B route has considerable heritage value. It traverses areas of dramatic landscape and varied geology, and has remained well preserved and largely unaltered since its opening in the 1840s. The wider railway network from the Yorkshire cities to Manchester contributed hugely to the economic and urban development of the North and was a major factor in the industrial revolution and in the development of towns.

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

The tricky geology and terrain of the W2B route presented challenges to the engineers of the 1840s, and many of the most notable surviving features of the railway are the impressively engineered bridge and viaduct structures. These structures are predominantly built from locally sourced stone, meaning they harmonise with the landscape and contribute to local views, adding to the aesthetic value of the route. The significance of the structures also lies in the fact that they survive well and in large numbers. There have been few alterations to bridges, mainly because this section of the line has not been widened as other parts of the wider route have been.

There are eight listed railway structures that will be affected by the proposed electrification works between Stalybridge and Standedge Tunnel; these are:

- Heyrod Hall Overbridge - MVL3/7
- Heyrod Footbridge Overbridge - MVL3/8
- Spring Bank Lane Overbridge - MVL3/9
- Roughtown Road Overbridge - MVL3/17
- Wright's Mill Overbridge - MVL3/20
- Wright's Overbridge - MVL3/23
- Oldham Road Overbridge - MVL3/28
- Saddleworth Viaduct - MVL3/31

All eight of the listed structures were designed by notable railway engineer Alfred Stanistreet Jee, lead engineer for the railway between Huddersfield and Manchester. They were built in the mid-late 1840s and share many architectural characteristics, adding to their group value and enhancing their significance.

Bridges MVL3/7, MVL3/9, MVL3/17, MVL3/20, MVL3/23, and MVL3/28 are all very similar in design. All are made from coursed local sandstone and have segmental arches formed from tooled voussoirs, with larger keystones. Each has dressed ashlar impost bands, sloping string courses above the arch, and parapet copings, with shallow pyramidal caps to the slender piers. They have considerable group value and are easily identifiable in the landscape as bridges associated with the original construction of the railway. The bridges are all well designed and adapted to their individual locations, some being skewed or sloped. High quality workmanship and

Historic England

details such as picked and tooled ashlar voussoirs elevate their design above what is purely function, enhancing their significance further.

Heyrod Footbridge (MVL3/8) and Saddleworth Viaduct (MVL3/31) are clearly recognisable as part of the same scheme of work but differ in their form. Heyrod Footbridge features a flat span, and retains its cast-iron edge beams and brick parapets, while Saddleworth Viaduct comprises 23 sandstone arches spanning the River Tame and Huddersfield Narrow Canal.

The structures are all Grade II listed in recognition of their special architectural and historic interest at national level. Saddleworth Viaduct was listed in 1986, while all seven overbridges were listed in 2017 or 2018 after a comprehensive review of the line.

Impacts

The proposals involve demolition and reconstruction of three structures, total removal of one structure, and modifications to four structures. These works are deemed necessary to achieve the clearance required for the OLE (overhead line equipment) and to ensure safety for bridge users. The impacts of proposed works at each structure are discussed below.

Bridges requiring demolition works:

Heyrod Hall Overbridge MVL3/7 carries a short section of private road over the railway to Heyrod Hall. This bridge is in a rock cutting with very hard rock beneath the track, prohibiting track lowering.

Wright's Mill Overbridge MVL3/20 carries the public footpath and bridleway over the railway where it passes through a steep-sided rock cutting. Options to lower the track at this bridge have been investigated but discounted due to the location on the bridge in a rock cutting with very hard rock beneath. Track lowering would also have a knock-on effect to a nearby underbridge.

Oldham Road Overbridge MVL3/28 is a skew overbridge located on the north-east side of Greenfield Station and carries Oldham Road over the track below. There will be

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

the addition of a new footbridge alongside the reconstructed road bridge. Options to lower the track at this bridge have been investigated but would be difficult to achieve due to the proximity to the station.

Proposals at these three bridges involves the complete dismantling of each bridge and reconstruction to create a raised, flat deck with sufficient clearance for OLE. Stone would be reclaimed and used to clad the inside faces of parapet walls; however matching stone is likely to be needed to clad the external sides of the parapets. New copers would also be needed to ensure parapets were the correct height.

The demolition and reconstruction of these bridges will cause substantial harm to their significance through the total loss of historic form and loss of much of their original fabric. The proposals will also diminish the group value of the historic bridges on the railway.

Wright's Overbridge MVL3/23 is a footbridge that carries a public footpath from north-west to south-east across the railway. The railway here is in a steep cutting and due to gradients, the bridge slopes down towards the south-east. Proposals involve the total removal of this bridge and diversion of the public right of way across the railway at another point.

The removal of Wright's Overbridge will cause substantial harm to its significance through the total loss of its historic form and all original fabric. Its removal will necessitate the re-routing of a historic public footpath, which is part of a network of paths in the area connecting mills and farms with workers' housing, and contributes to the landscape character of the area and to the setting of the bridge. The proposals will also further diminish the group value of the historic bridges on the railway.

Bridges requiring modifications:

Heyrod Footbridge Overbridge MVL3/8 carries a footpath running east-west over the railway, with steps on the eastern side down to a path running south-east towards Spring Bank Lane which are also listed.

Spring Bank Lane Overbridge MVL3/9 (also known as Heyrod Bridge) carries Spring Bank Lane over the railway. Due to the lie of the land the bridge slopes down towards the east. The splayed projecting wing walls are also covered by the listing.

SUITES 3.3 AND 3.4 CANADA HOUSE 3 CHEPSTOW STREET MANCHESTER M1 5FW

We respect your privacy and the use of your information. Please read our full privacy policy for more information
https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

Roughtown Road Overbridge MVL3/17 carries Roughtown Road north-south across the railway, to the east of Mossley Station. Due to gradients the deck slopes down towards the south. The projecting wing walls are also covered by the listing.

Minimal interventions are proposed at these three bridges, the most significant changes being the introduction of new triangular copers to ensure the correct and safe parapet heights.

The introduction of triangular copers to raise the parapet heights to 1.5m will result in a low level of less than substantial harm to the significance of the bridges through the changes to their appearance and the loss of original copers. This harm could be further lowed by using stone copers instead of concrete, and by undertaking any other restoration works required such as replacing the recently rendered section of parapet copings in the south-west corner of Roughtown Road Bridge.

Saddleworth Viaduct MVL3/31 (also known as Uppermill Arches and Uppermill Viaduct) carries the railway over a series of roads and lanes, and the River Tame and Huddersfield Narrow Canal. Due to the lack of space available on the viaduct deck, proposals here involve attaching brackets to the exterior of the viaduct for the OLE supports.

The proposed works at Saddleworth Viaduct will result in a low level of less than substantial harm to the significance of the structure through the change to its appearance and in the physical impact on the elevations of the viaduct from the brackets. This harm could be further lowed by ensuring the spacing of the masts responds to the structural and architectural rhythm of the viaduct to lessen their visual impact.

Policy

National policy relating to the conservation and enhancement of the historic environment is articulated in section 16 of the National Planning Policy Framework (NPPF, 2023). These policies state that heritage assets are an irreplaceable resource and should be conserved in a manner appropriate to their significance, so they can be enjoyed for their contribution to the quality of life of existing and future generations (NPPF para 195). Also, when considering the impact of a proposed development, great weight should be given to an asset's conservation (NPPF para 205).

SUITES 3.3 AND 3.4 CANADA HOUSE 3 CHEPSTOW STREET MANCHESTER M1 5FW

We respect your privacy and the use of your information. Please read our full privacy policy for more information
https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification (NPPF 206).

Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss. In practice this means that less harmful alternative solutions should be explored through the pre-application and application processes.

In addition to section 16 of the NPPF, we refer you to Section 12 'Achieving well-designed and beautiful places' when considering the design for replacement bridge structures. Para 132 states that being sympathetic to local character and history is important, along with a consistent and high-quality standard of design (para 133).

Position

The proposed works to upgrade the W2B section of the Transpennine route network will be the first major programme of work since its construction in the 1840s. The wider public benefits of the upgrade work to this key transport network will be vast and will have positive knock-on effects across the region. The challenging geology and hydrology across the route still present issues to engineers today, and we welcome the work that has gone into investigating alternative options to demolition and reconstruction for the bridges affected.

The proposals will result in substantial harm to the significance of bridges MVL3/7, MVL3/20, MVL3/23, and MVL3/28, with the highest level of harm to bridge MVL3/23 which will be dismantled and not reconstructed. The proposals will cause harm through the loss of the form of the arched bridges and though the loss of historic fabric. There will be the additional harm to the group value of the bridges.

We agree that the bridges are predominantly experienced from the bridge deck, and that re-use of original fabric should be focussed on the inside faces of the parapet walls to ensure the look of the bridge when crossing it is not unacceptably altered, however this re-use of materials does not lower the harm to less than substantial levels. It will be for decision takers to weigh the balance of this substantial harm against the public benefits of the scheme.

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

Works to bridges MVL3/8, MVL3/9 and MVL3/17 is largely limited to raising the parapets to ensure they are the safe and correct height. We acknowledge that Network Rail has a legal obligation to take reasonable steps to prevent people from coming into contact with the OLE by ensuring parapets cannot be climbed or walked on. We appreciate the work undertaken to investigate various options for different types of pantographs to limit the height at which the parapets need to be raised to. The use of triangular copers will introduce a change in the appearance of the bridges and cause a low level of less than substantial harm to their significance, but the impact can be lessened by use of stone rather than concrete copers which will be less visually obtrusive. Parapet design should be tailored to the individual circumstances of each bridge to ensure the least harmful solution is used.

There will also be a low level of less than substantial harm at Saddleworth Viaduct from the introduction of brackets to the structure to support the OLE. This can be further lowered by thoughtful spacing of the brackets.

We welcome the detailed options appraisals undertaken during the design of the proposed works to listed structures on the W2B route. We recommend that details are finalised using bespoke designs that respond to the particular character of each structure and its setting.

Next Steps

Thank you for involving us at the pre-application stage of this project. The above advice is the response that we would give if the same proposals were put forward unamended for statutory approval.

Yours sincerely

17 September 2024

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the meeting on 27 August to review the proposals for bridges MVL3/7, 8, 17 and 20. It was useful to see the drawings in advance and then talk through the proposals with the team.

The significance of the affected structures has been set out in our letter of 25 June 2024 and won't be repeated here. The impacts of the proposed changes and our comments are detailed below:

MVL3/7 - Heyrod Hall Overbridge
The changes to this bridge involve demolition and reconstruction of the bridge deck and sections of the abutments, resulting in substantial harm to the significance of the bridge. The bridge is built from coursed local sandstone, and the voussoirs have been lightly tooled around the edges to give them definition and add interest to the arch. The proposed changes will result in the total loss of the historic form of this bridge and much of the original fabric.

In order to reduce harm, every care should be taken when demolishing the bridge so as much original undamaged stonework as possible can be retained for re-use. Where new stonework is needed, this should be as close a match as possible to the original stone, and courses should match up to minimise the visual impact of the works. We welcome the use of natural cut stone copers.

MVL3/8 - Heyrod/Springbank Lane Footbridge
The appearance of this bridge will change slightly through the introduction of new copers which will increase parapet height. The use of natural stone will help to minimise the appearance of the new copers and mean they were be less obvious. Overall, there will be a very low level of less than substantial harm to this bridge.

MVL3/17 - Roughtown Road Overbridge
This is another bridge where the proposals involve the introduction of new copers

SUITES 3.3 AND 3.4 CANADA HOUSE 3 CHEPSTOW STREET MANCHESTER M1 5FW
Telephone 0161 242 1416
historicEngland.org.uk

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

which will increase parapet height. The changes here will be more noticeable than at MVL3/8 but still constitute a low level of less than substantial harm.

In order to minimise harm, it will be necessary to carefully design the ends of the new sections of coping stones to manage how they interact with the piers of the bridge. The piers are topped by shallow pyramidal caps, which currently form a prominent feature of the bridge's architecture. There is a danger that the definition of these caps will become lost if the new copers butt up to them. This mitigation could be achieved by either terminating the new copers short of the piers, or by raising the height of the pier caps so they remain prominent.

Additional mitigation should involve repairs to the fabric of the parapet walls, including removal of the cement kerb section and bollards, which will no longer be needed once the road is one-way.

MVL3/20 - Wright's Mill Overbridge
The proposals for demolition and reconstruction of this bridge will result in a substantially altered structure and substantial harm to the significance of the listed asset.

The historic form and materials of this bridge are very similar to MVL3/7, and the proposed construction works are also comparable, however the proposed parapet at MVL3/20 will be noticeably taller due to the bridge's use as a bridleway. The proposal drawings show the ends of the new copers sharply sloping down towards the piers of the bridge.

As advised with MVL3/17 above, care should be taken in the design and integration of these copers so they complement the existing structure and do not appear overly obvious. As with MVL3/7, we advise that every care should be taken when demolishing the bridge so as much original undamaged stonework as possible can be retained for re-use. Where new stonework is needed, this should be as close a match as possible to the original stone, and courses should match up to minimise the visual impact of the works.

Next Steps

I look forward to reviewing the next series of proposals for other parts of the scheme.

Yours sincerely

Louise Davies

Our ref: PA01200823
18 July 2025

Dear Sarah

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the recent meetings to review the draft Heritage Statements that will be submitted for Listed Building Consent applications for changes to bridges on the proposed Transpennine Route Upgrade line.

The Heritage Statements are well considered and it is clear that alternative options to reconstruction have been investigated in each case, which are helpfully set out in tables in the reports. The proposals will result in substantial harm to listed bridges along the route, however clear justification for this has been set out in the Heritage Statements.

We very much welcome the inclusion of heritage interpretation at Greenfield Station. This is a significant early rail route and there is notable educational potential in the material that has been generated from the research into the railway structures as part of this project.

Regarding Oaklands Road underbridge MVL3/25, we are comfortable with the design of the proposals for the reconstruction of the parapet and stone turrets. These have been carefully considered to minimise the visual impact.

Next Steps

We appreciate having been involved at pre-application stage in this important project, and value being able to feed into design plans. If you require further pre-application advice please get in touch.

Yours sincerely

1. INTRODUCTION

1.1 Transpennine Route Upgrade

1.1.1 The Transpennine Route Upgrade (TRU) is a major, multi-billion pound program of improvements to increase capacity, improve journey time and reliability performance of rail services on the Transpennine Route.

1.1.2 The TRU will aim to deliver:

- An improved journey time for Leeds – Manchester Victoria of 42-44mins;
- An improved journey time for York to Manchester Victoria of 65-67mins;
- Capability to operate four 'express' and two 'semi-express' services an hour;
- Capability to operate up to two 'local services' an hour on the route;(subject to future operating timetables);
- Performance of the Transpennine Route to be 92.5% or higher each period;
- Larger freight containerisation capability (W12 gauge);
- Freight paths/rights to be retained as existing; and
- A contribution to Network Rail's Decarbonisation Strategy and climate policy.

1.1.3 The Network Rail (Stalybridge to Diggle (Saddleworth) Enhancements) Order extends from Stalybridge Tunnel, in the west, through to the western portal of Standedge Tunnel (the "Order Scheme"). This section of the Transpennine route follows the Tame Valley from Stalybridge to Diggle, and is referred to hereafter as Route Section W2B.

1.1.4 The TRU programme in Route Section W2B involves a variety of works including the electrification of the railway (installation of overhead line equipment (OLE) and associated infrastructure); reconstruction and modification of existing bridges to facilitate electrification of the railway, construction of a new station at Mossley, closure of Stockport Road Level Crossing and Moorgate Halt Level Crossing, railway works at Greenfield Station to support the upgrade and electrification of the railway track reconfiguration works and track lowering works through Stalybridge and Scout Tunnels.

1.1.5 Under the Planning (Listed Buildings and Conservation Areas) Act 1990, consent is required from the local planning authority for any

proposed works that would affect the character of a listed building. The Transport and Works Act 1992 introduced section 12(3A) into the Planning (Listed Buildings and Conservation Areas) Act 1990, the effect of which is to "call-in" for determination by the Secretary of State applications to the local planning authority for listed building consent where such consent is required in consequence of proposals included in an application for a Transport and Works Act Order (TWAO). The procedures in the Transport and Works Applications (Listed Buildings, Conservation Areas and Ancient Monuments Procedure) Regulations 1992 then apply to the call in of such listed building consent applications.

1.1.6 This Heritage Statement has been compiled in support of an application for listed building consent by Network Rail in respect of the proposed works on the grade II listed Wright's Overbridge (MVL3/23) (NHLE 1452409). This bridge is located in Saddleworth (NGR SD9810704133) Oldham. A location plan is provided in Appendix A.

1.1.7 Wright's Overbridge (MVL3/23) lies c. 130 m north of the Wright's Mills Conservation Area. The Historic England list description (included in full in Appendix B) names the listed building as "Railway Overbridge MVL3/23, Wright's". Throughout this Heritage Statement the structure is referred to as "Wright's Overbridge (MVL3/23)" in accordance with Network Rail's naming of the structure.

1.1.8 The preparation of this assessment has been informed by the Statement of History and Significance: West of Leeds (Alan Baxter Associates, 2024) and the Route-wide Statement of Significance (Alan Baxter Associates, 2019).

1.2 Scope

1.2.1 The requirement for assessment and its scope is guided by policy contained within the National Planning Policy Framework (NPPF, revised 2025) specifically paragraph 207, which seeks an assessment proportionate to the assets' importance and sufficient to understand the potential impacts of development. The specific scope of this assessment is determined by Network Rail's requirement to provide an objective assessment of the heritage value of assets that may be affected by the Order Scheme, and to appraise the nature and extent of any impact upon setting and significance.

1.2.2 This Heritage Statement will:

- Identify and discuss the heritage significance of the listed structure, including the contribution of setting;

- Present the design requirements of the Order Scheme at the structure;
- Present the process of development and optioneering which has led to the design proposal for the Order Scheme in relation to the structure;
- Identify the impacts of the design proposal on the significance of the structure, in the context of current national and local planning policy and guidance;
- Discuss any mitigation recommended in relation to the structure; and
- Consider the public benefits to be gained from the Order Scheme weighed against the impact on the significance of the structure, in line with the National Planning Policy Framework, 2024 and the Oldham Local Development Framework, 2011.

1.3 Current Conditions

1.3.1 Wright's Overbridge (MVL3/23) (Insert 1-1) is a mid to late 1840s masonry overbridge, designed by Alfred Stanistreet (A. S.) Jee for the Huddersfield and Manchester Railway. The overbridge is situated on the western edge of the village of Friezland, c. 6 km east of Oldham and comprises a single segmental-arched bridge, currently carrying a footpath over the Transpennine route.

1.3.2 The structure was subject to a detailed examination as part of Network Rail's maintenance regime in April 2017, which identified it to be in fair condition; a more recent visual inspection undertaken in April 2023 identified no change in the overall condition of the structure since the detail inspection was carried out. A number of small defects were identified, including:

- The low mileage parapet to be out of plumb to 25 mm (Insert 1-1) and
- Vegetation present along the inside face of the parapets.

Insert 1-1 View north across the west elevation of Wright's Overbridge (MVL3/23) showing parapet out of plumb

1.4 Summary of proposal

1.4.1 In order to achieve the TRU Programme objectives, electrification of the Route is required. This would require the alteration of a number of existing bridges, including Wright's Bridge Overbridge (MVL3/23) to accommodate OLE, higher line speed and increased freight trains. Following optioneering, it has been determined necessary to remove Wright's Bridge Overbridge (MVL3/23) to enable implementation of the Order Scheme.

2. LEGISLATION AND POLICY CONTEXT

2.1 Legislation

2.1.1 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) (the "Act") governs the designation and works to listed buildings in England.

2.1.2 The Act states in s.1 (5):

'In this Act "listed building" means a building which is for the time being included in a list compiled or approved by the Secretary of State under this section; and for the purposes of this Act—

a. any object or structure fixed to the building;

b. any object or structure within the curtilage of the building which, although not fixed to the building, forms part of the land and has done so since before 1st July 1948, shall be treated as part of the building.'

2.1.3 Under the Act, no one is permitted to undertake or cause to be undertaken any works that would affect the character of a listed building unless the works are authorised. Section 16 of the Act identifies that whether such works can be carried out is determined by the LPA or the Secretary of State:

1) 'Subject to the previous provisions of this Part, the local planning authority or, as the case may be, the Secretary of State may grant or refuse an application for listed building consent and, if they grant consent, may grant it subject to conditions.

2) In considering whether to grant listed building consent for any works the local planning authority or the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses.

3) Any listed building consent shall (except in so far as it otherwise provides) ensure for the benefit of the building and of all persons for the time being interested in it.'

2.1.4 In relation to the granting of listed building consent, Section 17 of the Act stipulates that conditions attached to listed building consent may include those with respect to:

a) the preservation of particular features of the building, either as part of it or after severance from it;

b) the making good, after the works are completed, of any damage caused to the building by the works; [and]

c) the reconstruction of the building or any part of it following the execution of any works, with the use of original materials so far as practicable and with such alterations of the interior of the building as may be specified in the conditions'.

2.1.5 It is also defined in s.17 (2) that a condition '*may also be imposed requiring specified details of the works (whether or not set out in the application) to be approved subsequently by the local planning authority or, in the case of consent granted by the Secretary of State, specifying whether such details are to be approved by the local planning authority or by him*'.

2.1.6 The Act also states in s.66 (1):

'In considering whether to grant planning permission or permission in principle for development which affects a listed building or its setting, the local planning authority or, as the case may be, the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses'.

2.1.7 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) also governs duties of the local planning authority relating to conservation areas, particularly Sections 69, 72 and 74.

- Section 69 requires local planning authorities to define as conservation areas any '*areas of special architectural or historic interest the character or appearance of which it is desirable to preserve or enhance'*.
- Section 72 confers a general duty '*with respect to any buildings or other land in a conservation area… special attention shall be paid to the desirability or preserving or enhancing the character or appearance of that area'*.
- Section 74 defines that demolition of a building in a conservation area is not permitted '*without the consent of the appropriate authority'*.

2.2 National Policy

2.2.1 The National Planning Policy Framework (NPPF, 2025) sets out the Government's planning policies for England and how these should be applied to contribute to the achievement of sustainable development, supported by the Planning Practice Guidance (updated July 2019) (MHCLG, 2019).

2.2.2 Section 2 of the NPPF outlines the principles of achieving sustainable development including, in Paragraph 8, an environmental objective 'to protect and enhance our natural, built and historic environment'. Paragraph 9 sets out that these objectives should be delivered through the preparation and implementation of plans and the application of the policies within the NPPF. Section 16 of the NPPF deals specifically with the historic environment. Where changes are proposed, the NPPF sets out a clear framework to ensure that heritage assets are conserved, and where appropriate enhanced, in a manner that is consistent with their significance.

2.2.3 This Heritage Statement aims to address relevant policy within the NPPF in relation to Section 16 'Conserving and enhancing the historic environment' which includes guidance on assessment of

significance of the heritage assets and their setting that may be affected by the proposed works and how to consider potential impacts on significance.

2.2.4 The following paragraphs as set out in the NPPF include key provisions considered of particular importance to this application:

- Paragraph 207 – *'In determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand the potential impact of the proposal on their significance.*'
- Paragraph 212 – *'When considering the impact of a proposed development on the significance of a designated heritage asset, great weight should be given to the asset's conservation (and the more important the asset, the greater the weight should be). This is irrespective of whether any potential harm amounts to substantial harm, total loss, or less than substantial harm to its significance.'*
- Paragraph 213 – '*Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification. Substantial harm to or loss of:*

  a) grade II listed buildings, or grade II registered parks or gardens, should be exceptional;

  b) assets of the highest significance, notably scheduled monuments, protected wreck sites, registered battlefields, grade I and II listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional.'*

- Paragraph 214 – *'Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss, or all of the following apply:*

  a) the nature of the heritage asset prevents all reasonable uses of the site; and

b) no viable use of the heritage asset itself can be found in the medium term through appropriate marketing that will enable its conservation; and

c) conservation by grant-funding or some form of not for profit, charitable or public ownership is demonstrably not possible; and

d) the harm or loss is outweighed by the benefit of bringing the site back into use.'

- Paragraph 215 – '*Where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate, securing its optimum viable use.'*
- Paragraph 216 – '*The effect of an application on the significance of a non-designated heritage asset should be taken into account in determining the application. In weighing applications that directly or indirectly affect non-designated heritage assets, a balanced judgment will be required having regard to the scale of any harm or loss and the significance of the heritage asset.'*
- Paragraph 219 - '*Local planning authorities should look for opportunities for new development within Conservation Areas and World Heritage Sites, and within the setting of heritage assets, to enhance or better reveal their significance. Proposals that preserve those elements of the setting that make a positive contribution to the asset (or which better reveal its significance) should be treated favourably.'*

Planning Practice Guidance

2.2.5 The Planning Practice Guidance (PPG) (MHCLG, 2019) provides further advice and guidance that expands the policy outlined in the NPPF. It expands on terms such as 'significance' and its importance in decision making. The PPG clarifies that being able to properly assess the nature, extent and the importance of the significance of the heritage asset and the contribution of its setting, is very important to understanding the potential impact and acceptability of development proposals (paragraph 008 Reference ID: 18a-008-20190723).

2.2.6 The PPG states that in relation to setting, a thorough assessment of the impact on setting needs to take into account, and be proportionate to, the significance of the heritage asset under consideration and the degree to which proposed changes enhance

or detract from that significance and the ability to appreciate it (paragraph 009 Reference ID: 18a-009-20190723).

2.2.7 The extent and importance of setting is often expressed by reference to visual considerations. Although views of or from an asset will play an important part, the way in which an asset is experienced in its setting is also influenced by other environmental factors such as noise, dust and vibration from other land uses in the vicinity, and by our understanding of the historic relationship between places.

2.2.8 Paragraph 013 of the PPG recognises that the contribution that setting makes to the significance of the heritage asset does not depend on there being public right or the ability to experience that setting. When assessing any application for development which may affect the setting of a heritage asset, local planning authorities may also need to consider the implications of cumulative change (Paragraph: 013 Reference ID: 18a-013-20190723 Revision date: 23 07 2019).

2.2.9 In relation to substantial harm, the PPG states that 'it is the degree of harm to the asset's significance rather than the scale of the development that is to be assessed' (paragraph 017). Harm to heritage assets can be avoided or minimised if proposals are based on a clear understanding of the heritage asset and its setting (paragraph 008 Reference ID: 18a-008-20190723). The NPPF indicates that the degree of harm should be considered alongside any public benefits that can be delivered by development.

2.3 Local planning policy

Oldham Joint Core Strategy and Local Development Framework

2.3.1 Local planning policy for Oldham is provided by the Joint Core Strategy and Development Management Policies of the Oldham Local Development Framework, adopted in November 2011, and a small number of retained policies from the Unitary Development Plan (2009).

2.3.2 Policy 24 of the Local Development Framework relates to the Historic Environment and is reproduced in full below:

Policy 24 Historic Environment

'Oldham has a rich historic environment with many significant and valuable features, structures and characteristics. The council will protect, conserve and enhance these heritage assets and their settings which adds to the borough's sense of place and identity.

Development proposals must have regard to:

- National and local guidance and policies on the historic environment.
- Oldham Rochdale Housing Market Renewal Pathfinder Heritage Assessments.
- Greater Manchester and Oldham Urban Historic Landscape Characterisation Study.
- Conservation Area Appraisals and Management Plans, where appropriate.

When allocating sites and determining applications for planning and advertisement consents, the council will seek to protect, conserve and enhance the architectural features, structures, settings, historic character and significance of the borough's heritage assets and designations including:

a. *Listed buildings.*

b. *Conservation areas.*

c. *Registered parks and gardens (their historic character and setting).*

d. *Scheduled ancient monuments (their archaeological value and interest).*

e. *Significant archaeological remains.*

f. *Locally significant buildings, structures, areas or landscapes of architectural or historic interest (including non-designated locally significant assets identified in the local lists compiled by the council).*

The council will support heritage-led regeneration, including the reuse of historic buildings such as mills, to achieve economic, community and regeneration objectives, where appropriate.

Listed Buildings

Development to, or within the curtilage or vicinity of, a listed building or structure must serve to preserve or enhance its special interest and its setting. There will be a strong presumption against proposals involving the demolition of listed buildings or structures. Proposals which would lead to the loss or cause harm to grade I and II listed buildings should be wholly exceptional. Development proposals for a building incorporating a historic shop front should make provision for its retention, restoration and repair.*

Conservation Areas

Development within or affecting the setting of a conservation area, including views in or out, must serve to preserve or enhance the character or appearance of the area. Proposals for all new development, including alterations and extensions to buildings and their re-use, must have a sensitive and appropriate response to context and good attention to detail. Proposals must not adversely affect important architectural or historic features or distinctive local features or structures unless it can be demonstrated that the development brings substantial benefits to the community. Proposals for the demolition of a building in a conservation area must demonstrate that it is unrealistic for the building to continue in its existing use and a suitable alternative use cannot be found, or the building is in poor structural condition and the cost of repairing and maintaining it would be disproportionate to its importance and value and the demolition would preserve or enhance the character or appearance of the conservation area. In exceptional circumstances, the fact that a demolition would bring substantial benefits to the local community may outweigh the balance in favour of the preservation of the building.

Registered Parks and Gardens

Development which would lead to the loss of, or cause harm to, the historic character or setting of any part of registered park and garden will not be permitted.

Scheduled Monuments

Development which would lead to the loss of, or cause harm to, scheduled ancient monuments should be wholly exceptional.

Local Designations

Development which would affect the following designations will only be permitted in cases where it can be demonstrated that the benefits of the development brings substantial benefits to the community which outweigh the preservation of the heritage asset:

- Significant archaeological remains.
- Locally significant buildings, structures, areas or landscapes of architectural or historic interest'.

Places for Everyone

2.3.3 Places for Everyone (Greater Manchester Combined Authority 2024) is a joint development plan covering nine Greater Manchester districts including Oldham, setting out a framework for sustainable development. Policy JP-P2 concerns Heritage and is of relevance to this assessment:

Policy JP-P2: Heritage

We will proactively manage and work with partners to positively conserve, sustain and enhance our historic environment and heritage assets and their settings. Opportunities will be pursued to aid the promotion, enjoyment, understanding and interpretation of heritage assets, as a means of maximising wider public benefits and reinforcing Greater Manchester's distinct character, identity and sense of place.

Local Plans will set out the key elements which contribute to the district's identity, character and distinctiveness and which should be the priority for conserving and enhancing in the future and demonstrate a clear understanding of the historic environment and the heritage values of sites, buildings or areas and their relationship with their surroundings. This knowledge should be used to inform the positive management and integration of our heritage by:

1. *Setting out a clear vision that recognises and embeds the role of heritage in place-making;*

2. *Ensuring that the heritage significance of a site or area is considered in accordance with national planning policy in the planning and design process and opportunities for interpretation and local engagement are optimised;*

3. *Integrating the conservation and enhancement of heritage assets and their settings, with creative contextual architectural responses that contribute to their significance and sense of place;*

4. *Delivering positive benefits that sustain and enhance the historic environment, as well as contributing to the economic viability, accessibility and environmental quality of a place, and to social wellbeing; and*

5. *Exploring opportunities to reduce greenhouse gas emissions that restoration of historic buildings offer.*

Particular consideration will be given to ensure that the significance of key elements of the historic environment which contribute to Greater Manchester's distinctive identity and sense of place are protected from harm. These include historic town centres, places of worship, historic transport routes including the canal network, industrial buildings and structures including textile mills, farmsteads and other sites, buildings, and areas of identified archaeological, architectural, artistic and/or historic value. Development proposals affecting designated and non-designated heritage assets and/or their settings will be considered having regard to national planning

policy. Where heritage assets have been identified as being at risk, Local Plans should identify specific opportunities for them to contribute to regeneration and place-making, and they should set out strategies for their repair and re-use. Development proposals which will help safeguard the significance of and secure a sustainable future for Greater Manchester's heritage at risk will be supported in principle, provided they are not contrary to national policy or other policies in the development plan. Proposals should be informed, as necessary, by the findings and recommendations of the appropriate heritage assessment(s) in the development plan evidence base and/or any updated heritage assessment submitted as part of the planning application process.

Historic England Guidance

2.3.4 Historic England has published a series of Good Practice Advice (GPA) notes and Advice Notes (AN) of which those of most relevance to this appraisal are GPA2 – Managing Significance in Decision-taking (Historic England, 2015), GPA3 – The Setting of Heritage Assets (Historic England, 2017), and AN12, Statements of Heritage Significance (Historic England, 2019).

2.3.5 GPA2 – Managing Significance in Decision-taking emphasises the importance of having a knowledge and understanding of the significance of heritage assets likely to be affected by the development and that the *'first step for all applicants is to understand the significance of any affected heritage asset and, if relevant the contribution of its setting to its significance'* (paragraph 4). Early knowledge of this information is also useful to a local planning authority in pre-application engagement with an applicant and ultimately in decision making (paragraph 7).

2.3.6 GPA3 – The Setting of Heritage Assets provides advice on the setting of heritage assets. Setting is as defined in the NPPF and comprises the surroundings in which a heritage asset is experienced. Elements of a setting can make positive or negative contributions to the significance of an asset and affect the ways in which it is experienced. Historic England state that setting does not have a boundary and what comprises an asset's setting may change as the asset and its surrounding evolve. Setting can be extensive and particularly in urban areas or extensive landscapes can overlap with other assets. The contribution of setting to the significance of an asset is often expressed by reference to views and the GPA in paragraph 11 identifies those views, such as those that were designed or those that were intended, that contribute to understanding the significance of assets.

2.3.7 AN12, Statements of Heritage Significance outlines a recommended approach to assessing the significance of heritage assets in line with the requirements of NPPF. It includes a suggested reporting structure for a 'Statement of Heritage Significance', as well as guidance on creating a statement that is proportionate to the asset's significance and the potential degree of impact of a proposed development. The AN also offers an interpretation of the various forms of heritage interest that an asset can possess, based on the terms provided in the NPPF Glossary (Annex 2); namely archaeological, architectural, artistic, and historic.

3. ASSESSMENT METHODOLOGY

3.1 Research

3.1.1 In accordance with Historic England guidance and as determined by policy requirements, this assessment identifies the baseline heritage interest of Wright's Overbridge (MVL3/23). The historical narrative informing the baseline has been derived from a review of various resources including maps and other cartographic and photographic sources. Statutory information in relation to the designated assets has been obtained from the National Heritage List for England maintained by Historic England and the Historic Environment Record maintained by Greater Manchester Archaeology Advisory Service.

3.1.2 Additional information concerning the assets, their condition, use and setting has been obtained from a survey undertaken by suitably qualified and experienced heritage specialists on 27 August 2024, including observation from surrounding vantage points and informed by appraisal and observation derived from close working with other disciplines within the project team.

3.2 Significance and setting

3.2.1 Assessment of the significance of heritage assets and their setting has been undertaken in consideration of guidance issued by Historic England. Significance is often established by statutory designations such as listed buildings, scheduled monuments and conservation areas. More particular advice as to what makes up significance is set out in AN12, which establishes a method for thinking consistently about the heritage values that can be ascribed to a place. When making an assessment of significance, numerous aspects are considered including architectural interest, historic interest, group value, social value, former uses and local distinctiveness. These aspects are grouped into four values defined in the NPPF as historical interest, archaeological interest, artistic interest, and architectural interest.

3.2.2 In assessing whether the setting of an asset contributes to its significance, and in assessing the effect of development, Historic England GPA3 provides a checklist of attributes that may affect setting and significance under five broad categories comprising:

- The location and siting of the development;
- The form and appearance of the development;
- Additional effects (change to skyline etc.);
- Permanence; and
- Consequential effects.

4. CONSULTATION

4.1.1 Historic England and Oldham Metropolitan Borough Council (OMBC) have been involved in ongoing stakeholder consultation with Network Rail through the development of Route Section W2B of TRU.

4.1.2 Regular meetings with Historic England and OMBC have been held to discuss design development of the proposal in relation to Wright's Overbridge (MVL3/23). Initial meetings were held periodically throughout 2021 and resumed in 2024 to discuss the overall route and design development for all structures along Route Section W2B.

4.1.3 The design development of the Order Scheme in relation to Wright's Overbridge (MVL3/23) was discussed during meetings with the statutory stakeholders on the dates outlined in Table 4-1 below:

Table 4-1 Consultation for Wright's Overbridge (MVL3/23)

Date	Stakeholder in attendance	Key agreements/items discussed
15 February 2021	• OMBC	• The challenge of electrifying the route introduced alongside an overview of the structures within OMBC area was presented. • MVL3/23 was introduced as a structure requiring intervention and arrangements made for a meeting to discuss in detail the optioneering for this structure.
02 March 2021	• OMBC	• An introduction to the heritage significance of the structure was given, alongside various details of the

Date	Stakeholder in attendance	Key agreements/items discussed

	• Historic England	bridge and its surroundings (confirmation that there are no utilities on the bridge deck, details of existing parapet height, overview of required drainage works).
		• Presentation of options to stakeholders comprising:
		  ○ Track Lower and retention of bridge with raised parapets;
		  ○ Bridge reconstruction; and
		  ○ Removal of bridge and re-routing footpath.
		• Track lower identified as the preferred option for both Historic England and OMBC, due to the limited impact required to the listed structure.
		• Historic England suggested considering standardising detail of works to structures where there would be comparable scope in order to better retain group value (e.g. similar approach to parapet raise)
		• Historic England raised the potential for establishment of a historical trail including interpretation in order to maintain or enhance understanding of the group value of the structures in the area.

26 May 2021	• Historic England • OMBC • Kirklees Council	• Overview of the structures along Route Section W2B which are of historic interest, including the grade II overbridges and underbridges which are noted for their inherent significance, particularly as essential railway structures. The group value of the bridges was identified as a key contributor to significance.

Date	Stakeholder in attendance	Key agreements/items discussed
		• Presentation of the purpose of Heritage Statements and their assessment of impact with the emerging GRIP 3 designs.[1] • Early-stage recommendations to minimise harm to significance against the requirements for justification of proposals and opportunities to pursue sensitive design and compensation. • Reassurance was provided to the councils that they will be involved in the GRIP 3 design process which will be used within the detailed design development of GRIP 4 (Single Option Development). Clarification was also provided on the sustainable heritage initiatives. • Historic England stated that they expect to get an understanding of significance at this stage and that they anticipate options to be shared for comment. Also stressed the importance of minimising harm.
6 February 2024	• Historic England	• Details of the challenges of the electrification of the route in relation to listed overbridges were presented. Design measures under consideration for addressing these challenges noted to include: • Reduced voltage clearances o Development of scheme-specific pantograph, reducing electrical clearances to a minimum. o Site specific risk assessments of bridges due to reduced overhead wire heights • Electrical protection works

[1] At the time of consultation in 2021, the delivery of railway investment programmes was managed by Network Rail as a staged process through use of the GRIP (Governance for Railway Investment Projects) process. GRIP 3 comprised option selection and GRIP 4 (Single Option Development). This has since been replaced by PACE (Project Acceleration in a Controlled Environment).

Date	Stakeholder in attendance	Key agreements/items discussed
		○ Risk-based approach to raising parapets. Where safe to do so, 1.5m height parapets may be employed, rather than standard 1.8m height. ○ This approach has been embedded in designs for Route Section W2B. • Example images of recently installed steeple copers were shared, and the potential for colouring of the concrete copers was noted. • The design approach for electrification across / under existing railway bridges was noted as having already been agreed in principle by Network Rail following consultation with the Local Authorities & Historic England at the preceding design stage.
5 March 2024	• Historic England	• Presentation of the optioneering undertaken for Wright's Overbridge (MVL3/23) and the rationale for the change in preferred option to Bridge Removal. • Historic England were asked what supporting information would be expected to accompany an application to remove the bridge, this was summarised as: ○ Overview of considered options and rationale for proposed works; and ○ Details regarding change in historic use as an access and of its current level of use. • Network Rail confirmed the re-routing of the Public Right of Way would need to be explored further with OMBC and local ramblers' groups.
22 April 2024	• OMBC	• Presentation of proposed works to the structures within Oldham, in which the proposal for Wright's Overbridge (MVL3/23) is to be confirmed.

Date	Stakeholder in attendance	Key agreements/items discussed
7 May 2024	• Historic England	• Agreement in principle with Historic England on the requirement for the removal of Wright's Overbridge (MVL3/23). • Proposals for the removal of Wright's Overbridge (MVL3/23) is the preferred option due to the limited use of the structure, construction constraints in its location and the carbon investment required. • The local authority are in support of the proposals presented and further consultation with the stakeholders is ongoing.
25 June 2024	• Historic England	• Pre-application advice letter from Historic England identifies the substantial harm to the significance of Wright's Overbridge (MVL3/23) arising from the total loss of historic form and all original fabric (Appendix C.1). • Historic England also identified that the proposal would diminish the group value of the historic bridges on the railway. • The removal of Wright's Overbridge (MVL3/23) was identified as the element of the Order Scheme resulting in the highest level of harm to a heritage asset.
27 August 2024	• Historic England	• Clarification was provided to Historic England that the proposed removal of Wright's Overbridge (MVL3/23) would involve the removal of the entirety of the structure, including the abutments. The retention of isolated sections of abutment would preserve little of the bridge's significance, while requiring ongoing maintenance of freestanding masonry structures next to the railway.

Date	Stakeholder in attendance	Key agreements/items discussed
		• The ambition of reclaiming masonry from the demolished structure for use on other works on Route Section W2B was also outlined by Network Rail.
06 November 2024	• Historic England	• The draft listed building consent drawings were shared prior to the meeting, with feedback requested from Historic England on the works shown in the drawings. Discussion also took place regarding the justification for proposed works. • The change from the initially preferred track lower to a proposed bridge removal was presented, alongside the constraints and justification for this change in position. • Historic England recognised the drivers behind the change in preferred option and requested that justification be clearly set out in the heritage statement.
29 November 2024	• Historic England	• Formal pre-application advice letter received from Historic England following the circulation of draft listed building consent drawings and the follow-up discussion (Appendix C.2). • The letter re-iterated the substantial harm that would arise from the proposed demolition of Wright's Overbridge (MVL3/23). The requirement for thorough justification to be presented in the documentation supporting the application for listed building consent was outlined.
2 April 2025	• OMBC (including heritage professionals from Growth Lancashire)	• Presentation of overview of the aims and objectives of TRU, with emphasis on the historic context of Route Section W2B and the 12 listed building consents applications which are being prepared for the various

Date	Stakeholder in attendance	Key agreements/items discussed
		works to the grade II listed bridges and viaduct along the route section. • Network Rail requested for the draft Heritage Statement to be reviewed by the Council for comment and feedback. • Presentation of overview of electrification challenges caused by the existing arch profile of a number of existing bridges and have developed bespoke solutions for these to achieve the required clearance. • Overview of the current status of each structure within OMBC's jurisdiction, including the reconstruction of Wright's Overbridge (MVL3/23). Network Rail explained that the current structure is not clear for electrification or freight, and track lower is not viable at its location, as such the removal and reconstruction of the structure is the preferred option.
4 April 2025	• Historic England	• Meeting to go over the draft Heritage Statements with Historic England. • Historic England were content with the assessment of significance for all structures, and noted that the optioneering tables were helpful. Historic England requestion for further details on the heritage interpretation as part of the heritage benefits.
12 May 2025	• OMBC (including heritage professionals from Growth Lancashire)	• Proposals and justification for demolition of Wright's Overbridge (MVL3/23) were presented to OMBC Heritage officers and the loss of the structure was identified to be clearly justified. Historic England were satisfied with the approach to the assessment of significance,

Date	Stakeholder in attendance	Key agreements/items discussed
2 June 2025	• Historic England	• Following receipt of the draft heritage statement for Wright's Overbridge (MVL3/23) Historic England confirmed that sufficient justification was provided for demolition of the structure.
24 June 2025	• OMBC (including heritage professionals from Growth Lancashire)	• Pre-application advice letter received from OMBC outlining local planning authority advice following review of the draft listed building consent application material. • OMBC found that the removal of Wright's Overbridge (MVL3/23) would result in the total loss of significance of the bridge, through the removal of its historic and architectural significance. • OMBC highlight that clear and convincing justification will be required for any harm arising to designated heritage assets, with substantial benefits required to outweigh substantial harm. • A high level of harm was also found to the group value of the bridges designed by A.S Jee on the TransPennine Route, due to the proposed demolition of Wright's Overbridge (MVL3/23) and reconstruction of four other bridges and a limited level of harm to group value arising from the alteration of three other structures.
18 July 2025	• Historic England	• Pre-application advice letter received from Historic England providing overarching feedback on proposals affecting listed bridges between Stalybridge and Standedge Tunnel (see Appendix C). • Acknowledgment given to the collaborative approach taken at pre-application stage, to fully explore

Date	Stakeholder in attendance	Key agreements/items discussed
		alternative options to reconstruction and for the opportunity for Historic England to feed into design plans. • The heritage statements adjudged to be well considered with clear justification having been provided for the substantial harm identified to those structures proposed for removal or reconstruction. • The inclusion of interpretation at Greenfield Station is welcomed by Historic England.

5. HERITAGE ASSETS AND THEIR SIGNIFICANCE

5.1 History of the W2B Transpennine Route

5.1.1 The railway connecting Stalybridge to Huddersfield, which runs under Wright's Bridge Overbridge (MVL3/23) was constructed by the Huddersfield & Manchester Railway Company between 1846 and 1849. The mid-1840s was a period of commercial confidence and massive expansion in the railway network across England, known as 'Railway Mania' which has been described by Historic England as the Heroic Age of railway building (Historic England 2017). Between 1845 and 1852 the railway network expanded from 2,345 miles to 7,272 miles (3774km to 11,703km) (Alan Baxter Associates 2019). Constructed at the height of this boom, the Stalybridge to Leeds line was a product of this trend. Traversing a challenging landscape through the Pennines, the line was planned to follow the route of the Huddersfield Narrow Canal for much of its length, with the canal acquired by the Railway Company the year after the railway's authorisation (Alan Baxter Associates 2019). These difficult landscape conditions resulted in the need to build several major viaducts and tunnels. These included Standedge Tunnel through the Pennines, which was constructed alongside the 1811 canal tunnel and is *'indisputably significant as a major engineering achievement'* (Alan Baxter Associates 2024).

5.1.2 The development and expansion of the railways during the 19th century transformed the landscape and settlements through which they passed, fuelling industrial growth and settlement expansion. The impact of improved communications, first with the arrival of the

canal in 1811, and then the railway in 1849, provided valuable links with Huddersfield, Manchester and Leeds, enabling import of raw materials and export of manufactured goods. This fuelled the gradual industrialisation and settlement expansion along the Tame Valley. This can be seen on historic Ordnance Survey maps dating from the 19th and early 20th century where industrial development including mills, dyeworks, printworks and quarries, is shown to have been present along the route of the railway and extending into the more upland areas around Saddleworth and Harrop Dale, whilst settlements such as Mossley and Dobcross gradually expanded.

5.1.3 Wright's Overbridge (MVL3/23) was constructed for the Huddersfield & Manchester Railway Company in the mid to late 1840s. The principal engineer for the Huddersfield & Manchester Railway was Alfred Stanistreet (A. S.) Jee (1816–1858), who was assisted by the more renowned engineer Joseph Locke (1805–1860). Jee's work on the Huddersfield & Manchester Railway represents, arguably, his greatest achievement. This can be seen particularly in the construction of the Standedge Tunnel, which at three miles long was one of the longest and most difficult in England, but also through the various large-scale viaducts along the route. In the 1850s, he worked internationally on the Spanish line from Alar-del-Rey to Reynosa where his skill in design, his accuracy and his completeness of the details earned him high praise (Institution of Civil Engineers: Obituaries, 1859). He died in a fatal accident upon the opening of the second portion of that line.

5.1.4 In 1847, prior to the opening of the line, the Huddersfield & Manchester Railway Company was taken over by the London and North Western Railway (LNWR). As part of the LNWR network, the Huddersfield & Manchester Railway formed part of a direct route from Manchester to the West Riding, enabling the LNWR to access the textile and coal industries of West Yorkshire. By 1851, the LNWR was the most prominent railway company of the period, with over 800 miles of track and was the largest joint-stock concern of its time, capitalised at £29 million. The line was acquired by the London Midland and Scottish Railway in 1923, before being nationalised in 1948.

5.1.5 Whilst other parts of the Transpennine route were subject to significant alterations, the Huddersfield & Manchester Railway between Standedge Tunnel and Stalybridge was subject to relatively limited alteration. The Micklehurst Loop was constructed from 1881-85 to provide additional capacity, and diverged from the existing railway to the east of the Tame Vally, avoiding physical interaction with the majority of its alignment. A new junction to the south of Greenfield Station is shown on historic maps from the early 20th century as additional tracks toward Oldham were established from

this station. However similarly to the Micklehurst loop, the additional lines diverged from the main Huddersfield line, running westwards at its intersection with Shaw Hall Bank Road Footway (MVL3/26). The railway was also widened to the east of Diggle to accommodate additional tracks serving new bores for the Standedge Tunnel which were added in 1868-71 and 1894, necessitating widening of bridges to the east of the route.

5.1.6 Piecemeal change has occurred on the Huddersfield & Manchester Railway, most notably with the closure of a small number of stations along the route, such as Diggle and Saddleworth Stations. The route today forms part of the wider Transpennine route between York, Selby and Manchester, which comprises sections of rail line developed by different railway companies.

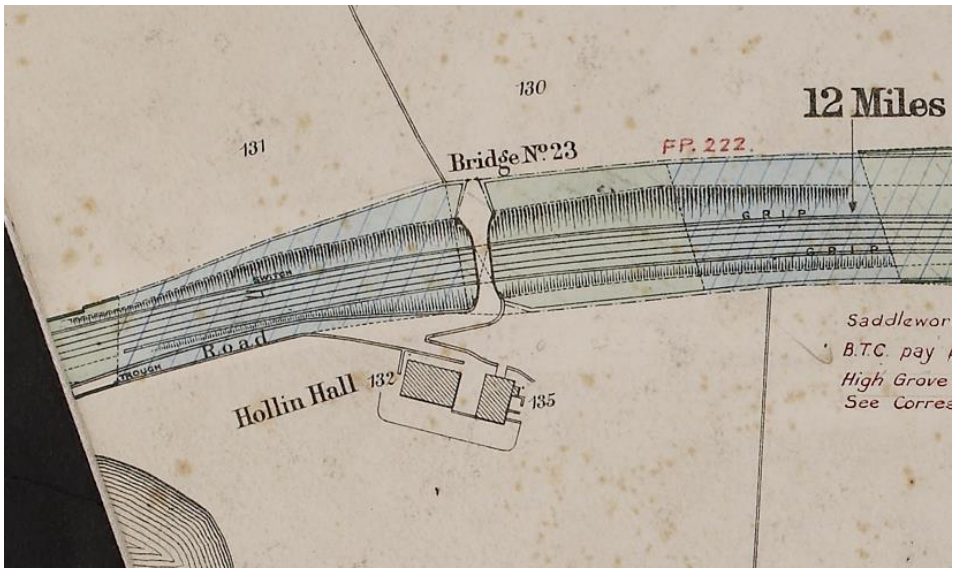
5.1.7 The history and significance of the Transpennine route is discussed at more length in the Route-Wide Statement of Significance (Alan Baxter, 2019). This was produced to characterise the overall heritage significance of the Transpennine route as a whole.

5.2 Wright's Overbridge (MVL3/23)

History

5.2.1 Wright's Overbridge (MVL3/23) was constructed between 1845 and 1849 during the Heroic age of railway building. The single-span bridge was designed by A.S. Jee for the Huddersfield & Manchester Railway. Labelled as Hollin Hall Bridge on the 1st edition 1:10,560 Ordnance Survey map of 1854, the bridge provided access across the railway line to and from Hollin Hall. Hollin Hall is depicted on the 1st edition Ordnance Survey map as a square-plan building located directly to the south-west of the railway bridge. The bridge may have been constructed as an accommodation bridge for Hollin Hall, providing access to land on the opposite side of the railway line. Now known as Wright's Overbridge, the name may indicate a historic connection with the nearby Wright's Mill, located c.450 m to the south-west, however no firm evidence for this association has been identified in the course of this study.

5.2.2 The line plans held by Network Rail (Insert 5-1) show the historic relationship between Wright's Overbridge (MVL3/23) and Hollin Hall. This access between the hall and route over the railway bridge no longer exists.



Insert 5-1 Wright's Overbridge (MVL3/23) from the historic line plans held by Network Rail (1905).

Description

5.2.3 Wright's Overbridge (MVL3/23) comprises a single segmental-arched bridge with battered abutments and slightly curved wing walls (Insert 5-2 and Insert 5-3). The railway crossing is aligned north-west to south-east, sloping downwards towards the south-east due to the gradient of the local topography, and spans the two-track railway line which is set within a cutting with sloping sides.

5.2.4 The footbridge is constructed in regular-coursed, quarry-faced buff sandstone and features large sections of unadorned stone walling within the north-eastern and south-western façades. Of architectural interest, the arch piers and voussoirs have tooled margins, with the keystone breaking the line of the arch both above and below, a common design feature with A. S. Jee's bridges on this route. An impost band, sloping string course and parapet with chamfered coping rise above the arch of the bridge and are also faced with coursed ashlar stonework, the parapets terminating in slender piers with pyramidal caps. The bridge deck has vegetation growing to either side of a central path, surfaced with roughly compacted stone (Insert 5-4).

5.2.5 The setting of Wright's Overbridge (MVL3/23) has evolved since the bridge was first constructed. Originally known as Hollin Hall Bridge, the bridge provided access from Hollin Hall across the railway to the land to the north. Fencing now prevents access between the hall and the bridge. Residential development took place on the land associated with Hollin Hall in the late 20th century, with rear garden fencing bounding the footpath on the south-east side of the bridge. Vegetation growth along on the approaching footpaths and on the

bridge deck limit visibility of the of the bridge from the wider area and create a sense of wildness, with the historic connection with Hollin Hall not readily apparent when approaching or crossing the structure.

Insert 5-2 Wright's Overbridge (MVL3/23), south-west elevation.

Insert 5-3 Wright's Overbridge (MVL3/23), north-east elevation.

Insert 5-4 View south-west across the deck of Wright's Overbridge (MVL3/23).

Significance

5.2.6 Wright's Overbridge (MVL3/23) was designated as a grade II listed building in March 2018. The Historic England List Entry description (Appendix B) identifies the bridge to be of special interest for the following principal reasons:

- Historic interest:
  - Constructed during the heroic age of railway building and a little-altered example of an 1840s overbridge on what is now one of the main railway lines in northern England;
  - Designed by the notable railway engineer Alfred Stanistreet Jee.
- Architectural interest:
  - The bridge is well-detailed with ashlar impost bands and string course, and piers and voussoirs with tooled margins, that lift its design above the purely functional.
- Group value:
  - With the other listed structures designed by Jee on the Huddersfield & Manchester Railway line.

5.2.7 The bridge's original construction between 1845 and 1849 places it within the Heroic Age (1841-50) of railway development and links it to the period of 'railway mania' which marked a time of commercial confidence and expansion in the railways. The bridge's direct historic relationship with historic railway companies of the period, comprising the Huddersfield and Manchester Railway and LNWR, and the notable railway engineer A. S. Jee, who also designed similar structures along the route, give the structure historical value from which it derives significance. The bridge remains in use as a part of the operational railway network and, together with surviving contemporary structures, evidences the historic infrastructure of the Huddersfield & Manchester Railway.

5.2.8 The bridge derives significance from the quality of its architecture and construction, a characteristic feature of Jee's work for the Huddersfield & Manchester Railway. The considered use of features such as rusticated voussoirs, impost bands and stringcourses, as well as the quality of craftsmanship seen in its detailing elevate the bridge above a purely functional design. The bridge survives in its original form, with no evidence of significant intervention or alteration, and continues to provide access across the railway. The structure still reveals Jee's original design intent, and this is a strong contributing factor to its significance.

5.2.9 The setting of Wright's Overbridge (MVL3/23) makes a minor contribution to the significance of the structure. Its intrinsic relationship with the railway is a key component of its setting given that the bridge continues to span the railway cutting, retaining a close physical and functional relationship with the railway. Views from the bridge north-east and south-west along the railway evidence this relationship. However, there is very limited visibility of the bridge elevations, due to its position within the cutting. The historic connection between the bridge and Hollin Hall is no longer immediately evident due to intervening fencing, rerouting of the historic approach and limited visual link between the structures.

Group value

5.2.10 As identified in the list description, Wright's Overbridge (MVL3/23) is recognised to be of group value with other structures designed by A.S. Jee on the Huddersfield & Manchester Railway[2]. These comprise:

[2] Wheatley's Overbridge (MVL3/103) (grade II listed NHLE 1450537**)** was designed by A.S. Jee for the Huddersfield & Manchester Railway. The Overbridge was granted consent for extensive change as part of the Huddersfield to Westtown (Dewsbury) Order section of the Transpennine Route Upgrade, and will be demolished and replaced with a new structure (ref

- Heyrod Hall Overbridge (MVL3/7) (grade II listed, NHLE 1449242);
- Springbank Lane Footbridge (MVL3/8) (grade II listed, NHLE 1452382);
- Springbank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (grade II listed, NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405);
- Wright's Mill Overbridge (MVL3/20) (grade II listed, NHLE 1452406);
- Royal George Underbridge (MVL3/25) (grade II listed, NHLE 1451848);
- Shaw Hall Bank Road Footway (MVL3/26) (grade II listed, NHLE 1451852);
- Oldham Road Overbridge (MVL3/28) (grade II listed, NHLE 1451853);
- Wickens Underbridge (MVL3/29) (grade II listed, NHLE 1451854);
- Uppermill Viaduct (MVL3/31) (grade II listed, NHLE 1068120);
- Slaithwaite Viaduct (MVL3/61) (grade II listed, NHLE 1224049);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);
- Milne Viaduct (MVL3/76) (Longwood Viaduct) (grade II listed, NHLE 1220121);
- Church Street (MVL3/82) (grade II listed, NHLE 1452083);
- Huddersfield Viaduct (MVL3/92) (grade II listed, NHLE 1223531);
- Hillhouse Lane Underbridge (MVL3/94) (Willow Lane East) (grade II listed, NHLE 1432641); and

2021/91337). This is likely to result in de-listing. As such its contribution to group value has therefore been excluded from this assessment.

- B6118 Colne Bridge Road Overbridge (MVL3/107) (grade II, NHLE 1450265)[3].

5.2.11 Of these bridges, four are of particularly similar form, comprising segmental arched bridges of stone construction, which are similarly detailed architecturally. These overbridges comprise:

- Heyrod Hall Overbridge (MVL3/7) (grade II listed, NHLE 1449242);
- Springbank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405); and
- Wright's Mill Overbridge (MVL3/20) (grade II listed, NHLE 1452406).

5.2.12 The group value which Wright's Overbridge (MVL3/23) derives from these relationships provides an understanding of the wider trends and engineering achievement which characterise both the Huddersfield & Manchester Railway and the Heroic Age (1841-1850) of railway building more generally. This group value is enhanced by the structures continuing to form part of the operational railway; as a collective group of assets, they are experienced by those following the rail line (traveling on it, or near it) as coherent features of a single historic route.

5.2.13 Masonry railway bridges across the historic Huddersfield & Manchester Railway route have been characterised as being of local or regional interest, depending on their architectural quality, contribution to wider historical interest of the route, and their group value. It has been noted however that, as a group, they are not of substantial national interest due to their dating from a period of railway development when thousands of similar structures were erected (Alan Baxter Associates 2019).

5.3 Surrounding heritage assets

5.3.1 The location of the designated and non-designated heritage assets discussed below are shown in Appendix A.

[3] B6118 Colne Bridge Road Overbridge (MVL3/107)) (grade II, NHLE 1450265) will be partially demolished and rebuilt with a supplementary structure replacing its spans over the railway. listed building consent has been granted for this considerable intervention (ref: 2021/91330), and as a result may limit the contribution that this bridge makes towards the group value with the Jee bridges.

Designated heritage assets

5.3.2 There is one listed building within a 250m study area surrounding Wright's Overbridge (MVL3/23). This comprises the grade II listed Royal George Canal Bridge (NHLE 1390053), a canal bridge constructed in 1798 as part of the Huddersfield Narrow Canal, which is located *c*. 200 m south-east of Wright's Overbridge (MVL3/23). The intervening distance, undulating topography, vegetation and development prohibits any spatial relationship between the canal bridge and Wright's Overbridge (MVL3/23). Moreover, the lack of direct historical association further diminishes any interrelationship between the two bridges.

5.3.3 The Royal George Mills Conservation Area is focussed to the south of the Huddersfield Narrow Canal centred on Royal George Mill to the west of Well-I-Hole Road (B6175). The conservation area is characterised by the historic industrial development of the Royal George Mills within a rural landscape between the canal and the River Tame, being located within the low-lying ground of the valley, with largely uninterrupted views towards the Pennines. Despite the location of the conservation area within 150m of the overbridge, intervening modern development, undulating topography and vegetation prevents any visual relationship between the two assets. The assets do not enjoy any historic or visual relationship and therefore do not contribute to each other's significance.

Non-Designated Heritage Assets

5.3.4 The local Historic Environment Record (HER) records four non-designated heritage assets within the 250m study area, comprising:

- The location of the former Royal George Mills site (6046.1.0);
- Canal Lock 18W (19033.1.0);
- Canal Lock 19W (19034.1.0); and
- Friezland School (19058.1.0).

5.3.5 With the exception of Friezland School (19058.1.0), these assets are located between *c.* 150 m and 250 m east of Wright's Overbridge (MVL3/23). As with the related conservation area (see above), the locks, mill site and railway bridge do not enjoy a historic or visual relationship and do not contribute each other's significance. The remaining non-designated heritage asset, Friezland School (19058.1.0), is sited *c.* 230 m north-east of the overbridge and similarly does not share any historic or visual relationship with Wright's Overbridge (MVL3/23), with no shared contribution to the significance of either heritage asset.

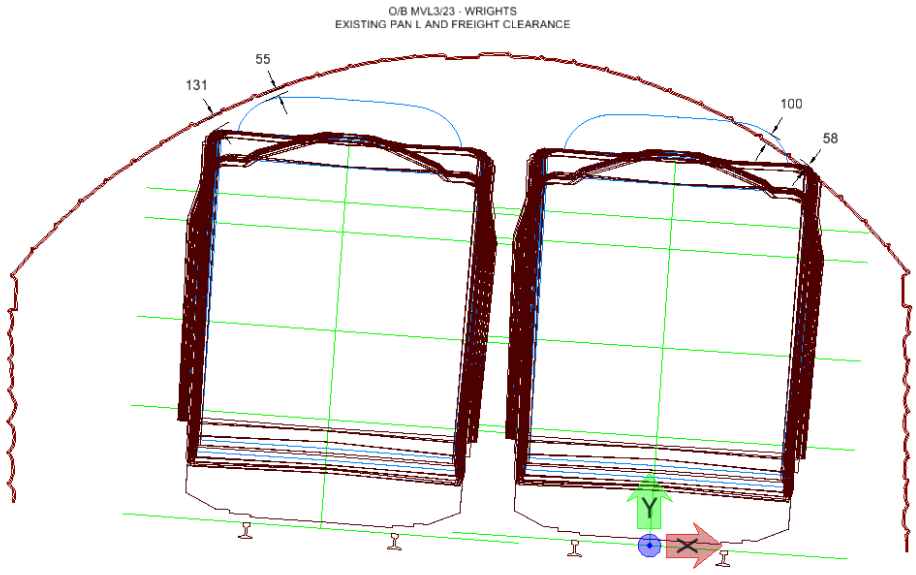
6. PROPOSALS

6.1 Background to proposals

6.1.1 In order to achieve the TRU Programme objectives of improving journey times, capacity, overall reliability and resilience, and delivering environmental benefits, the electrification of the railway line and achievement of increased line speed is required. Works to the underbridges along the route are required to accommodate the resulting additional loadings on the structures resulting from increased line speeds and increased train loading.

6.1.2 Inadequate clearances to safely install OLE has been recognised as a challenge across much of TRU, preventing the installation of overhead lines below some existing overbridges. To reduce the requirement for intervention into structures along the route as far as possible, a scheme-specific pantograph has been developed which enables the use of reduced overhead line wire height under structures, subject to a site-specific risk assessment. A number of structures along the route also do not provide adequate gauge clearance for the required freight trains on the route, the requirement for which has been considered as part of the design development process.

6.1.3 Insert 6-1 shows that even with use of the scheme-specific pantograph, there would still be a clash between OLE and Wright's Overbridge (MVL3/23). Similarly, the bridge does not have the required freight gauge clearance. A process of design optioneering to identify the optimal solution has been undertaken.



Insert 6-1 Drawing showing the clash between existing structure and proposed pantograph level

6.2 Design development and justification

6.2.1 Design development for Wright's Overbridge (MVL3/23) has taken into consideration a number of factors including the significance of the listed structure, operational requirements and constructability. The design development process has also involved engagement with Historic England and OMBC (as detailed above in Section 4). This iterative and robust process ensures the rigorous exploration of available options, incorporating multi-disciplinary review and ongoing engagement with the heritage consultees.

ES3 optioneering

6.2.2 Based on Network Rail's extensive experience delivering comparable schemes, five options were identified for further consideration at the ES3 design stage in 2021[4]. As introduced in Section 6.1, the option of retaining the structure without undertaking any works would prevent the delivery of the Order Scheme. This option was therefore discounted at an early stage. The remaining four options considered at ES3 comprised:

1. Track lower - Lowering the height of the track to achieve the required headroom while retaining existing bridge;
2. Bridge jacking - Increasing the height of the bridge through structurally lifting the arch barrel up from the abutments. This would require diagonal cuts to be made to separate the arch barrel from the abutments, lifting of the arch, infilling of the resulting gaps and refacing;
3. Bridge reconstruction – Removal of the bridge arch and replacement with a deck providing sufficient clearance; and
4. Bridge removal – demolition of the existing bridge, making good the embankments and re-routing of the existing footpath.

6.2.3 A summary of the ES3 optioneering process is summarised in Table 6-1 below.

[4] The delivery of railway investment programmes is managed by Network Rail through the use of PACE (Project Acceleration in a Controlled Environment). This provides a flexible control framework for the delivery of rail projects. Under PACE, ES3 comprises optioneering and identification of a single design option, whilst ES4 is approval of design in principle.

Table 6-1 Optioneering for Wright's Overbridge (MVL3/23)

Option	Key Considerations	Advantages	Disadvantages	Preferred
1) Track Lower	• Sufficient clearance needs to be achieved to enable electrification of the line and allow freight gauge clearance. • Time required working within the railway corridor is required to be minimised as far as possible to reduce risk to construction staff and the length of line possession (closure of the railway) and resulting disruption to railway service. • The bridge spans a railway cutting, is not readily accessible from the highway network and is in a relatively isolated location. This restricts the accessibility of construction vehicles and the delivery of materials / components getting to the site. • Ground Investigation has revealed rock to be present at shallow depth within the railway cutting. There is currently no functional track drainage at this location. • The foundation depths of the bridge and cutting retaining walls are a consideration in the development of proposals for Wright's Overbridge (MVL3/23). Lowering of ground level within the cutting has the potential to undermine these foundations or necessitate significant engineering works to ensure their stability. • The designation of the bridge as a grade II listed structure places a requirement on Network Rail to have special regard for its preservation under the Planning (Listed Buildings & Conservation Areas) Act 1990.	• Lowering of the track would enable retention of the bridge with raising of the parapets undertaken prevent access to OLE.	• To achieve the required clearance, the track would have to be lowered by 115mm for 210m on the east-bound line and 135mm for a distance of 320m on the west-bound line. Due to the shallow depth of rock at this location, this is a substantial engineering operation. • The feasibility of the track lower relies on a reduced electrical clearance, which would be subject to a site-specific risk assessment • The required drainage works at this location would have to be undertaken through bedrock should the track be lowered.	Y
2) Bridge Jacking		• This option would enable the retention of the listed bridge. The abutments, deck and parapet would be retained, although in altered form.	• Bridge jacking for masonry arch bridges is a relatively untested methodology, having been delivered on very few historic structures to date. The feasibility of jacking masonry arch structures relies on optimal site conditions, where a high level of control can be achieved and long timescales allowed for implementation. The long-term viability of this option is currently unknown. • Bridge jacking would incur extensive disruption to railway users, requiring all works to be delivered on site and little scope for off-site construction. • The location of the bridge over a cutting with severely limited access has significant limitations for execution of a bridge jacking operation. • Jacking of the bridge would raise the level of the footpath across the bridge and require a greater intervention to parapet height across the structure. • Raising of the bridge arch would impact the form and appearance of the structure, interrupting architectural features such as the stringcourse and the stone coursing across the parapets, detracting from its architectural value and integrity.	N
3) Bridge Reconstruction		• Reconstruction of the bridge would enable the preservation of some elements of the historic structure, through the retention and reuse of the bridge abutments in conjunction with the new bridge deck. • Historic masonry could potentially be reclaimed from removal of the bridge arch and parapets for reuse on the reconstructed structure, aiding integration of historic and modern fabric and reduce the visual impact of the reconstruction works. • Reconstruction of the bridge could be delivered substantially from track level. This would minimise the need for construction access by road at this constrained site. • The installation of a preconstructed deck would minimise railway possession time and disruption to the railway network.	• Reconstruction of the bridge would result in the loss of the bridge arch and a portion of the parapets and abutments. This would result in the removal of a significant proportion of the historic bridge, substantially altering its form and appearance, and negatively impacting the integrity of the structure. • Due to site topography and no access by road, construction activities would be very restricted resulting in additional cost, programme and disruption to the locals to create a suitable route to the structure to enable a reconstruction. It is expected that temporary land take and disruption to the nearby residents rear gardens would be required.	N
4) Bridge Removal		• Removal of the bridge would minimise disruption to the railway network and provide a cost effective solution. • Removal of the bridge and re-routing of the footpath represents a constructable solution at a severely constrained site. • Historic masonry can be reclaimed from removal of the bridge arch and parapets and reused at other sites on Route Section W2B.	• This option would result in the complete removal of the bridge and the loss of a grade II listed structure. • Demolishing the bridge would require the re-routing of an established public right of way.	N

6.2.4 Option 1 Track Lower, was progressed as the preferred option primarily because it would allow the retention of the listed structure in an altered form. Option 2 Bridge Jacking was discounted due to the difficulty of delivering a novel engineering intervention at this constrained site and the as yet unproven long-term viability of this structural intervention. Option 3 Bridge Reconstruction and Option 4 Bridge Removal were discounted because the less impactful option of track lowering was considered to be feasible.

6.2.5 After the ES3 design process, Option 1 Track Lower was progressed as the preferred option. Further detailed analysis of the proposals would be undertaken as part of the ES4 design process, informed by additional survey, ongoing design input from each of the relevant engineering disciplines and incorporating feedback from a partnered construction contractor.

6.2.6 During the ES3 development for MVL3/23 the requirement for freight clearances was not part of the Order Scheme remit. Freight clearances were introduced at a later stage in ES3 which resulted in an increase to the magnitude of track lower to 170mm. The conclusion of the ES3 option development was not changed but site investigation was procured to investigate the level of rock and drainage provision at the site.

ES4 review

6.2.7 At the commencement of the ES4 design stage in 2023, a comprehensive review was undertaken of the preferred options identified across the whole Route Section W2B as part of a validation exercise. This review identified a number of issues around constructability, access and disruption to the railway network in the area.

6.2.8 As part of this process, additional survey of the track bed at Wright's Bridge (MVL3/23) was undertaken to inform the progression of detailed design. The result concluded the rock level was higher than anticipated. Survey of the existing track drainage revealed routes provided by channels dug into the rock in both cesses, comprising inflows from springs and the former High Grove Mill reservoir and an outflow to the former Lower Grove Mill reservoir.

6.2.9 An ES4 site inspection and point cloud survey of the bridge identified that both bridge parapets were leaning significantly, this is likely due to the dense vegetation on the structure. The parapets would need to be broken down and rebuilt vertical to allow them to be raised to provide electrical protection.

6.2.10 The conclusion of this reappraisal was that the previously designed track lower would not achieve the minimum required track formation without significant excavation of rock along the length of the track lower. In order to provide adequate drainage, the channels in the cess would need to be dug deeper. These findings necessitated more detailed examination of the optioneering and preferred option for Wright's Overbridge (MVL3/23).

6.2.11 This assessment found that track lowering would significantly increase the cost of construction and extend the duration of the line closure, resulting in unacceptable disruption to railway users.

6.2.12 To inform this process and to ensure the deliverability of the preferred option, input from a construction contractor was sought. This highlighted the difficulties of reconstructing the bridge in this location due to limited access via road and limited access adjacent to the structure to enable off track construction works. Temporary land take was highlighted as a requirement with a proposed access route through a housing estate and properties driveways/gardens. This would have resulted in significant disruption to locals, and increased construction costs and programme duration. Reconstruction was also found to significantly increase the duration of line possession (closure of the railway line) required for construction, resulting in unacceptable delay and disruption to railway users.

6.2.13 A survey of pedestrian usage of the existing footpath was undertaken to provide an understanding of the public benefit currently afforded by the bridge and the degree of impact likely to arise from a temporary or permanent re-routing of the public right of way. This survey found the bridge to be very lightly used on a daily basis with only 11 individuals crossing the bridge on the day of the survey.

6.2.14 A whole life costing exercise was undertaken to understand the relative cost to public funds of Option 3- Reconstruction and Option 4 – Bridge Removal. Comparison of these options revealed between the approaches shows a significant difference in the whole life cost of construction, inspection and maintenance over the anticipated design life of a reconstructed overbridge. This assessment identified that Option 3 - Reconstruction would cost c. £3.1m to reconstruct and maintain an overbridge at this location. This was compared with the estimated cost for Option 4 – Bridge Removal, which was assessed to cost c. £400,000. This cost allowed for site setup and track possession, removal of the bridge, diversion of the public right of way (including drainage requirements), making good the embankments and ongoing inspections and maintenance over 125 years. Overall, it is estimated that the whole life cost of removing the

structure would be approximately £2.7m less than if it were to be reconstructed. This assessment demonstrated that Option 4 Bridge Removal would bring considerable benefits in terms of future public spending compared to the cost required to maintain and eventually replace a reconstructed bridge.

6.2.15 Based on consideration of this more detailed information, Option 1 Track Lower was found to be unfeasible from an engineering and cost perspective. Option 3 – Reconstruction was found to result in high levels of disruption to railway users and a high level of cost for a structure which is lightly used by pedestrians with suitable alternative routes nearby. Option 4 - Bridge Removal was found to bring considerable benefits in terms of future public spending compared to the cost required to maintain and eventually replace a reconstructed bridge. Option 4 - Bridge Removal was therefore identified to be the preferred option. The increased impact on the significance of the listed building was, however, recognised.

6.2.16 Comparison of Option 3 Bridge Reconstruction and Option 4 Bridge Removal on the significance of Wright's Overbridge (MVL3/23) found both options to result in substantial harm to the structure.[5] Option 3 Bridge Reconstruction would result in the reconstruction of the majority of the structure, retaining a small amount of historic fabric as part of a reconstructed bridge and the continued legibility of a historic access route across the railway in this location, whilst Option 4 Bridge Removal would result in the complete removal of the structure.

6.2.17 Considered on balance, the substantial harm to Wright's Bridge (MVL3/23) arising from Option 4 Bridge Removal was found to be justified due to:

- The site-specific constraints limiting constructability;
- The limited use of the structure as a public right of way for which an alternative route can be provided; and
- The high level of public spending which would be required for reconstruction.

6.2.18 Option 4 Bridge Removal was therefore selected as the preferred option following the ES4 design.

[5] Planning Practice Guidance identifies that the substantial harm includes total loss of significance (paragraph 18a-018-20190723). The tests outlined in National Planning Policy Framework paragraph 214 apply for substantial harm or total loss. It is therefore considered that reconstruction and removal of the bridge would both result in substantial harm, with the level of harm being marginally greater in the case of removal.

6.3 Preferred option design development

6.3.1 Following identification of Option 4 Bridge Removal as the preferred option, design development was subsequently undertaken with the aim of mitigating the potential impact of the electrification of the line on the heritage significance of the structure as far as reasonably practicable.

6.3.2 Consideration has been given to the feasibility of retaining and consolidating the abutments *in-situ* following the removal of the arched span. This option would retain sections historic fabric *in situ*. However, the limited amount of historic fabric remaining would not retain any of the historic structure's significance and would incur an ongoing maintenance and safety liability presented by a freestanding masonry structure adjacent to an electrified railway line. This would pose an ongoing risk and would require regular structural condition assessments and maintenance, and the attendant costs of this, for structural remains with no practical function sited in proximity to the railway corridor. The delivery of surveys and maintenance of the abutments would also result in safety risks to Network Rail staff to undertake these works and require periodic line possessions to enable safe working. The retained abutments would also present a risk as a potential point from which the railway corridor could be accessed. It is likely that security fencing would need to be introduced to any retained section of the abutments, impacting the degree to which any residual architectural interest could be appreciated. For this reason, the option of removal the bridge in its entirety and reprofiling the embankments was selected as the preferred option.

6.3.3 It is anticipated there will be an opportunity to reuse masonry from the demolished structure for works on the wider route. During demolition of the bridge, retention of historic fabric will be maximised as far as possible. Any suitable masonry reclaimed from the removal of bridges along the Route Section W2B will be used for cladding.

6.4 Description of proposals

6.4.1 It is proposed to demolish grade II listed Wright's Overbridge (MVL3/23). The structure would be broken down to 500mm below ground level. Reprofiling works are then proposed on both sides of the railway to tie in with the existing embankments to either side of the existing bridge (Insert 6-2). The public right of way would be re-routed under nearby Hobbe Hole Underbridge (MVL3/22), requiring minor surfacing works and vegetation clearance which lie outside the scope of this application for listed building consent.

Construction Methodology

6.4.2 Due to the limited space at track level and lack of highway access, the proposed methodology would require all plant to arrive on track. Road rail vehicles would be used to remove arisings from demolition. Reclamation of historic masonry would be undertaken as far as possible with transportation and secure storage at the site construction compound. Stone will be subject to preliminary rapid assessment for potential reuse and then palletised ready for transportation to sites along the wider project route where it will be redressed and used as appropriate.

6.4.3 The proposed works to Wright's Overbridge (MVL3/23) are shown in the following drawings which accompany this application:

- Existing and Proposed Plan (167037-TGP-25-MVL3-DRG-T-LP-162312); and
- Existing and Proposed Elevation and Section (167037-TGP-25-MVL3-DRG-T-LP-162313).

7. IMPACT OF PROPOSALS

7.1 Wright's Overbridge (MVL3/23)

7.1.1 As identified above; in order to construct the Order Scheme, demolition of Wright's Overbridge (MVL3/23) is proposed. This would result in the total loss of the structure. The proposed works would remove the historic and architectural value of the structure.

7.1.2 The loss of this asset will mean the removal of a historic bridge that is part of the physical infrastructure associated with the Heroic Age (1841-50) of railway construction. It is not only a loss in its own right, but also detrimental to the historic character and group value that this structure contributes to as part of the Transpennine railway line.

7.1.3 The proposed demolition of the structure would have an impact on the group value of the bridges designed by A.S. Jee on the Transpennine route. The loss of Wright's Overbridge (MVL3/23) would remove one element of this group of 18 designated bridges designed by A.S. Jee (see paragraph 5.2.10) and one of the five bridges which share a common design language (see paragraph 5.2.11). The other bridges designed by Jee derive part of their value from their group relationship. The significance of each of the other bridges will therefore be slightly diminished by the removal of one of their number. The impact of this demolition would amount to less than substantial harm to the retained structures arising from a weakening of the extent to which group value contributes to their significance.

7.1.4 These proposals would therefore result in the total loss of the asset and substantial harm to the significance of Wright's Overbridge (MVL3/23). As discussed in paragraphs 6.2.7 to 6.2.15, detailed consideration has been given to the option of reconstructing the listed overbridge. However, this would still result in substantial harm to its significance. The issues of site-specific topography constraining potential construction methodology, demonstrated limited use of the structure with a viable alternative public right of way to be provided, and high whole life cost were felt to outweigh the minor benefit of retaining a small portion of historic fabric *in-situ*.

7.2 Other heritage assets

7.2.1 The proposals would have no impact on any other surrounding designated or non-designated heritage assets.

7.3 Mitigation

7.3.1 Proposals to reclaim and reuse masonry from the grade II listed Wright's Overbridge (MVL3/23) have been embedded as an integral part of the proposed Order Scheme. This fabric would be utilised for reuse as cladding of structures elsewhere on the Route Section W2B as far as possible. The reuse of this fabric would partly compensate adverse impacts arising from the work.

7.3.2 During construction of the works, toolbox talks would be implemented. These would disseminate best practice for reducing potential impacts in relation to construction activity associated with Wright's Overbridge (MVL3/23), for example to ensure the approach taken to maximising masonry for reclamation is communicated.

Recommended Compensation

7.3.3 In addition to these embedded measures, additional mitigation secured through the use of listed building consent conditions is recommended comprising:

- A scheme of historic building recording to Level 3 standards in accordance with Historic England guidance (Historic England 2016). This would provide a permanent record of Wright's Overbridge (MVL3/23) in its current form and be lodged with the Greater Manchester Historic Environment Record. This building recording would help to compensate for the harm to significance resulting from the reconstruction by providing the opportunity to document the structure which will be largely lost as a result of the proposed works. The historic building recording would include:
    - Drawings;
    - Photography; and
    - Written account.
- A scheme of permanent heritage interpretation would be developed and installed adjacent to Greenfield Station. This would provide the opportunity to engage members of the public with the heritage of the Huddersfield & Manchester Railway including the historic structures designed by A. S. Jee, such as Wright's Overbridge (MVL3/23). Further engagement with stakeholders with respect to the content of the interpretation would be undertaken during the detailed design phase.

7.4 Public benefit

7.4.1 The works proposed to be undertaken to Wright's Overbridge (MVL3/23) are required to ensure the realisation of the substantial public benefits of the Order Scheme, in accordance with paragraph 214 of the NPPF.

7.4.2 As part of the wider TRU Programme, the Order Scheme would directly and indirectly play a role in improving regional connectivity and enhancing of some of Britain's busiest rail network, in turn realising economic, social and environmental objectives of the programme. The Transpennine route is identified as a key transport corridor, providing connections between cities in the North of England. The improvements in connectivity delivered by the TRU programme will support aspirations for economic growth and "levelling up" opportunities across the North of England.

7.4.3 The key objectives of the TRU programme are to achieve the part electrification of the Transpennine Route, improve journey times and capacity between key destinations, improve overall reliability and resilience of the route, and provide environmental benefits from modal shift from road to rail freight reducing the number of heavy vehicles on the highway network and associated air pollution. The demolition of Wright's Overbridge (MVL3/23) would directly facilitate the achievement of these aims by resolving the insufficient clearance beneath the bridge to accommodate electrification and the use of larger gauge trains, thereby allowing increases in line speed to be delivered, and capacity and resilience to be enhanced.

7.4.4 Electrification would deliver faster journey times and improved performance by allowing trains to accelerate faster, and brake more efficiently. The Order Scheme will deliver faster line speeds (80 mph throughout), improving journey times along the Transpennine Route, aiming to provide an improved journey time from Leeds – Manchester Victoria of 42-44 minutes and York to Manchester Victoria of 65-67 minutes. Works to the track and structures along the Route, including the demolition of Wright's Overbridge (MVL3/23), are required to accommodate this increase, and without these changes the Scheme would be unable to go ahead.

7.4.5 As a vital constituent part of the Order Scheme, the proposed demolition would also facilitate indirect benefits associated with the wider programme of works, including station upgrades, track renewal and signalling improvements.

7.4.6 The reliability and resilience of the route and services operating on it will be improved by replacement of existing infrastructure with electrification equipment, new track drainage and signalling.

7.4.7 Modern signalling equipment will reduce the headway between trains, allowing them to run closer together which will in turn provide increased capacity. The Scheme will provide the capability to operate four 'express', two 'semi-express' services and up to two local services an hour on the Route and will provide increased flexibility to timetable more train paths.

7.4.8 Electrification of the Scheme would provide substantial environmental and sustainability benefits and is an investment in 'greener' energy technology. This supports Network Rail's Decarbonisation Strategy and is bolstering national targets for reducing harmful emissions that cause climate change, which are set out in Government legislation for achieving net zero carbon by 2050.

7.4.9 The Order Scheme will also deliver improved safety through measures including replacement of two level crossings, installation of additional safety measures on existing bridges; enhancements to the local highway networks and new pedestrian crossing points at locations including Greenfield and Mossley Stations. Accessibility of the railway network will also be improved with the provision of fully accessible stations at Greenfield Station and the relocated Mossley Station. These measures are being brought forward as part of the wider TRU Scheme to electrify and modernise the Route, as facilitated, in part, by the demolition of Wright's Overbridge (MVL3/23).

7.4.10 Significant residual beneficial effects arising from the operation of the wider TRU Scheme have been previously identified in the Huddersfield-Westtown TWA Order Inquiry from December 2021. These included recognition of improved journey times, reliability, and capacity at the Local Authority area and in turn the sub-regional and regional level. These improvements will bring direct significant benefits to local businesses and the labour market through improved access to the local regions along the section of the route from Stalybridge to Diggle.

7.4.11 To this effect, the proposals at Wright's Overbridge (MVL3/23) are therefore essential in achieving the overall substantial public benefits of the Order Scheme and wider objectives of the TRU Programme, and without these interventions, the Order Scheme would not be able to be safely and successfully implemented. Alongside these substantial public benefits, the delivery of heritage interpretation adjacent to Greenfield Station would enable public engagement with the heritage of the Huddersfield & Manchester Railway, its architecture and significance.

8. CONCLUSION

8.1.1 The significance of Wright's Overbridge (MVL3/23) lies primarily in its historical and architectural interest. The bridge is a largely unaltered example of an 1840s overbridge, dating from the Heroic Age (1841–50). The high quality of the bridge's architecture, including segmental arches with rusticated voussoirs and keystones, together with the high-quality workmanship of its construction is characteristic of A.S. Jee's work for the Huddersfield & Manchester Railway. The bridge also derives significance from this direct historical relationship with notable railway engineer A.S. Jee and the historic railway companies namely the Huddersfield & Manchester Railway and LNWR. The setting of Wright's Overbridge (MVL3/23) makes a minor contribution to the significance of the structure, it also possesses group value as one of a number of A.S. Jee structures on the Transpennine route which share a common design language.

8.1.2 A number of design options were pursued to achieve the clearance required for the OLE. The OLE is a fundamental part of the Order Scheme to deliver a faster service (reduced journey time) and to make provision for electrification and the operation of a 'greener' transport solution. The development of a scheme-specific pantograph which enables the use of reduced overhead line wire height under structures, subject to a site-specific risk assessment, has not resolved the clash between proposed OLE and the listed structure.

8.1.3 A full and robust optioneering process was undertaken in consultation with the LPA and Historic England to develop proposals for Wright's Overbridge (MVL3/23). This reviewed options comprising track lowering, bridge jacking, bridge reconstruction and bridge removal, and considered these against a range of factors comprising:

- Local geology including the shallow depth of rock within the railway cutting;
- The topography of the site;
- Accessibility for construction;
- Buildability within the constraints of working on an active railway network;
- Safety requirements;
- Use of the structure as a public right of way; and
- Comparative whole life costs of reconstruction and demolition.

8.1.4 Removal of the bridge was identified, on balance, to deliver substantial public benefit, in terms of delivering a feasible and cost-

effective design solution, reducing disruption to rail users and the railway network, and in achieving the aims of the Order Scheme. Whilst this option is recognised to result in the total loss of the structure and substantial harm to Wright's Bridge (MVL3/23), it is considered that the substantial public benefits of the Order Scheme outweigh this harm, in accordance with the requirements of paragraph 214 of the NPPF.

8.1.5 The loss of Wright's Overbridge (MVL3/23), which is a grade II listed building, should be considered exceptional. This will mean the loss of an irreplaceable piece of railway infrastructure, dating to the Heroic Age (1841-50) of railway building. It is also a loss to the collection of A.S. Jee bridges that are located along this section of the Transpennine route.

8.1.6 The design process has been undertaken in a strongly collaborative manner and has sought historic environment professional support from the outset. The desire to maximise heritage benefits and limit harm was the primary position. Every effort was made to retain this historic structure as part of TRU. However, this was unachievable with the operational parameters set. Regular consultation with historic environment stakeholders and the design team were held throughout the design development process. Historic England and OMBC have accepted that the approach of demolishing the structure is necessary to deliver the proposed Order Scheme, and that the justification for this harm is clear and convincing. The design development process, including engagement with historic environment stakeholders, resulted in compensation measures being agreed, to be secured as conditions of the LBC (see Section 7.3).

8.1.7 With the demolition of Wright's Overbridge (MVL3/23), the Order Scheme can achieve key improvement objectives as outlined in Section 7.4. It would also support the achievement of substantial public benefits related to:

- Improved efficiency and reliability of the railway (in journey time saving and increased capacity);
- Reduction of delays to trains and other highway users (improved efficiency of the railways means fewer heavy vehicles on the highway network causing traffic issues and contributing to air pollution);
- Supporting sustainable transport development in line with Network Rail's Decarbonisation Strategy; and

- Improving public health and safety in providing safe routes across the railway (with the public right of way rerouted under Hobbe Hole Underbridge (MVL3/22).

8.1.8 In addition to this, the delivery of a programme of heritage interpretation at Greenfield Station would provide the opportunity for engagement of the public with the heritage of the Huddersfield & Manchester Railway.

8.1.9 Whilst the demolition of Wright's Overbridge (MVL3/23) is regrettable, its loss would be outweighed by the substantial public benefits that accrue from enabling the Transpennine programme to be achieved. The proposals would therefore meet the requirements of paragraph 214 of the NPPF in relation to the justification for substantial harm and provide sufficient justification to outweigh the strong presumption against demolition of listed buildings outlined in policy 24 of the OMBC local development framework and Policy JP-P2 of Places for Everyone.

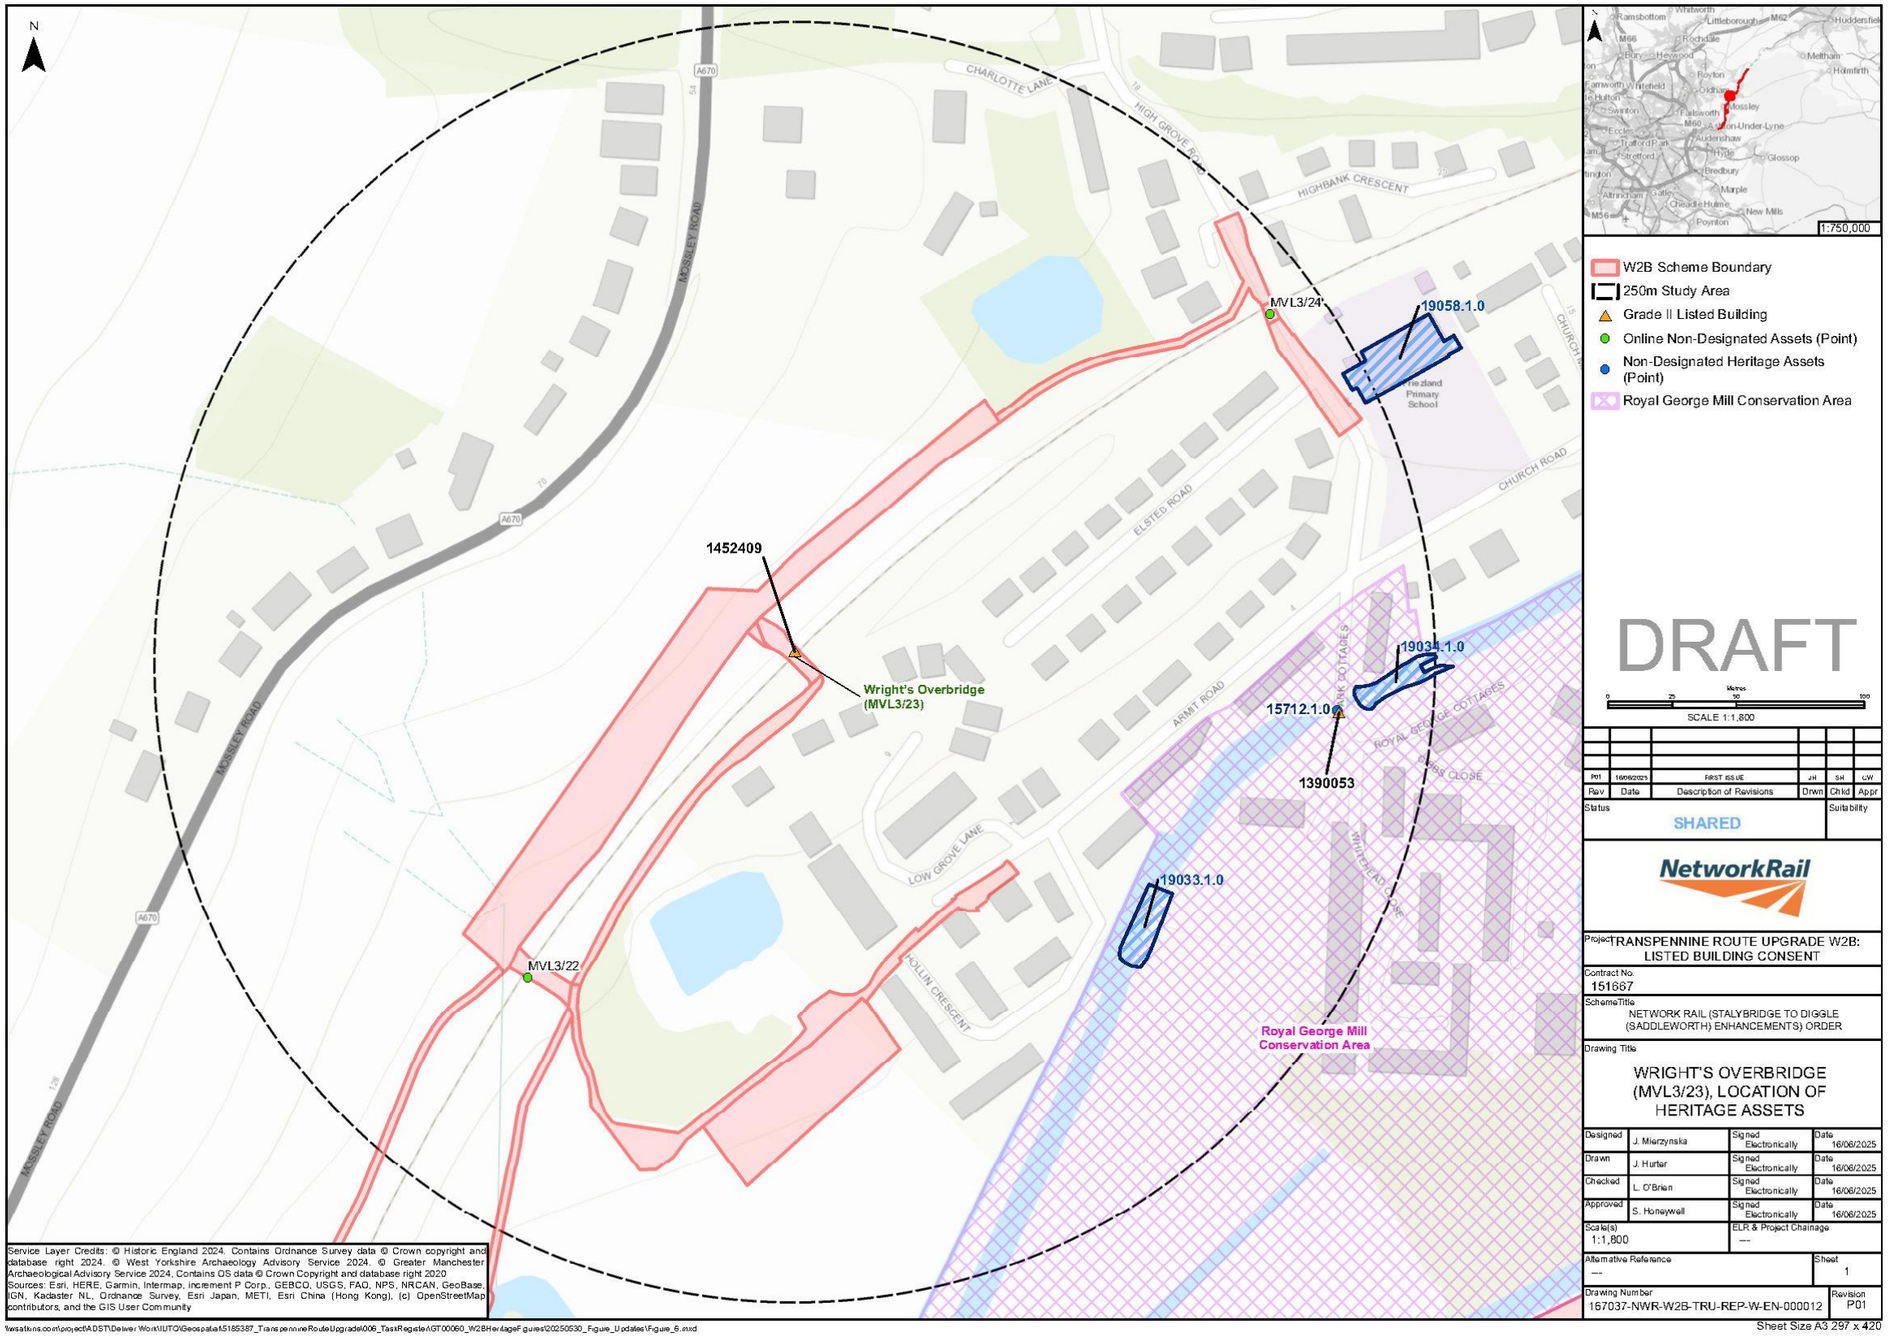
APPENDIX A – LOCATION PLAN



APPENDIX B – NATIONAL HERITAGE LIST DESCRIPTION

Official list entry

Heritage Category:	Listed Building
Grade:	II
List Entry Number:	1452409
Date first listed:	23-Mar-2018
List Entry Name:	Railway overbridge MVL3/23, Wright's
Location Description:	Footpath from Mossley Road to Hollin Hall, Greenfield.

Location

The building or site itself may lie within the boundary of more than one authority.

District:	Oldham (Metropolitan Authority)
Parish:	Saddleworth
National Grid Reference:	SD9810704133

Summary

Railway overbridge, 1845-1849, by AS Jee for the Huddersfield & Manchester Railway.

Reasons for Designation

Wright's Overbridge (MVL3/23), constructed in the mid-late 1840s by AS Jee for the Huddersfield & Manchester Railway, is listed at Grade II for the following principal reasons:

Historic interest:

* constructed during the heroic age of railway building and a little-altered example of an 1840s overbridge on what is now one of the main railway lines in northern England;

* designed by the notable railway engineer Alfred Stanistreet Jee.

Architectural interest:

* the bridge is well-detailed with ashlar impost bands and string course, and piers and voussoirs with tooled margins, that lift its design above the purely functional.

Group value:

* with the other listed structures designed by Jee on the Huddersfield & Manchester Railway line.

History

In contrast to the main trunk lines of the late 1830s that were constructed by single railway companies the route from Stalybridge to Leeds had fragmented origins and was the work of three different railway companies: the Huddersfield & Manchester Railway, Leeds, Dewsbury & Manchester Railway, and the Manchester & Leeds Railway.

The Huddersfield & Manchester Railway was authorised in 1845 and followed the route of the Huddersfield Narrow Canal for much of its length, including a railway tunnel through the Pennine hills set alongside the earlier Standedge Canal Company tunnel of 1811; in 1846 the railway company also acquired the canal. Joseph Locke and Alfred Stanistreet Jee were appointed to survey and design the new line, the two engineers having already worked together on a major project linking Manchester and Sheffield. Jee became the lead engineer for the Huddersfield line, which passed through challenging terrain, assisted by resident engineers that included his brother Moreland Jee (until 1848) and Herbert F Mackworth. Construction of the line was divided into various contracts, with many contractors being only responsible for a single cutting, viaduct or tunnel portal. The largest contract for the Standedge Tunnel between Diggle and Marsden was let to a single contractor, Thomas Nicholson in 1847. The tunnel's completion in 1849 marked the opening of the line.

The Leeds end of the route, which was also authorised in 1845, was constructed by the Leeds, Dewsbury & Manchester Railway. The engineer was Thomas Grainger who had previously largely worked in Scotland, and the line was completed in 1849.

A short three-mile section of the route between Heaton Lodge Junction and Thornhill Junction near Mirfield was developed by the Manchester & Leeds Railway and was constructed in 1837 to 1840, with George Stephenson as the chief engineer. The structures on this line were designed by Thomas Gooch under the oversight of Stephenson. In 1847 the railway company changed its name to the Lancashire & Yorkshire Railway.

In 1847 the Huddersfield & Manchester Railway and the Leeds, Dewsbury & Manchester Railway were acquired by the London & North Western Railway (LNWR) so that the company could access the city of Leeds and the textile towns of West Yorkshire. This pitted them as rivals to the Lancashire & Yorkshire Railway, although at points on the route the two companies had to work together. By 1851 the London & North Western Railway had an overall mileage of railway track of 800 miles, and it became the most prominent railway company in the country and the largest joint-stock concern in the world in the late C19. Although the LNWR had a general manager, Captain Mark Huish, the lines of the Stalybridge to Leeds route still managed their own affairs. LNWR later carried out expansion works, including the widening of tracks and bridges, the construction of additional tunnels, and station alterations. In 1923 the line became part of the London Midland & Scottish

Railway, and subsequently part of the nationalised British Railways in 1948. The line, its structures and track are currently (2018) owned by Network Rail, and the passenger services operated by TransPennine Express and Northern Rail.

This overbridge was built to carry the footpath from Mossley Road to Hollin Hall over the railway. It was designed by AS Jee (1816-1858) and dates from the line's construction from 1845-1849. It remains as built.

Details

Railway overbridge, 1845-1849, by AS Jee for the Huddersfield & Manchester Railway.

MATERIALS: buff sandstone.

DESCRIPTION: the bridge carries the footpath from north-west to south-east across the railway. Due to gradients it slopes down towards the south-east. The bridge comprises a single segmental-arched span recessed between battered abutments to either side of the steep cutting, with a parapet.

The stonework is regular-coursed and quarry-faced. The stone of the arch piers and the voussoirs has tooled margins, the keystone breaking the arch above and below. The impost bands, sloping string course above the arch and the chamfered-and-weathered parapet copings are dressed. The abutments curve outwards slightly at all four corners and terminate in slender piers with shallow, pyramidal caps. The arch soffit is narrow-coursed masonry with tooled detailing. The road surface was much overgrown at the date of survey (2017).

29 November 2024

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the meetings on 6 and 21 November 2024 to review the proposals for bridges MVL3/9, 10, 23, 25, 26, 28, 29 and 31. As before, it was helpful to see the drawings in advance and then talk through the proposals with the team.

The impacts of the proposed changes and our comments are detailed below:

Proposals at *Manchester Road underbridge MVL3/10*, *Shaw Hall Bank Road underbridge MVL3/26* and *Wickens underbridge MVL3/29* will involve minor works, consisting of renewal of railings and strengthening of parapets with reinforced concrete. Visually, there will be only a minor impact, as the replacement railings are similar to the existing and the concrete strengthening will be hidden from view by the parapets. There will be a very low level of less than substantial harm to the physical fabric of the bridges due to the new railings being grouted into cored holes in the masonry parapet blocks. We do not have concerns over the works at these three bridges and recognise the efforts to maintain the visual appearance on the bridges.

The proposals for *Spring Bank Lane overbridge MVL3/9* and *Uppermill Viaduct MVL3/31* have been discussed at previous meetings, and it was helpful to see further details of the works at these structures. There will be a low level of less than substantial harm to *Spring Bank Lane overbridge* due to the introduction of raised copers, however the use of colour-matched concrete here will help to mitigate some of the harm caused by the visual impact of the new copers. Works to *Uppermill Viaduct* will likewise lead to a low level of less than substantial harm due to the introduction of brackets to support the OLE portals which will have an impact both physically and visually. We appreciate that care has been taken in the spacing of these portals so the rhythm of the bridge arches is not unduly interrupted, and so that the pattress plates are not affected.

More considerable impacts will result from proposals at *Wright's overbridge MVL3/23*, *Oaklands Road underbridge MVL3/25* and *Oldham Road overbridge (Greenfield*

Historic England

Station) MVL3/28, all of which will result in substantial harm to the significance of the designated assets.

As mentioned in previous letters, the removal of *Wright's Overbridge* will cause substantial harm to its significance through the total loss of its historic form and all original fabric, and through the re-routing of a historic public footpath. Thorough justification will need to be presented in the supporting documentation to provide the reasoning for the total loss of this bridge.

The proposed reconstruction of *Oldham Road Overbridge* has also been discussed previously. This is a skew overbridge located on the north-east side of Greenfield Station which carries Oldham Road over the track below. The bridge currently has a masonry arch which will be dismantled, along with much of the approaching wing walls, resulting in very little historic fabric being retained. The works will also necessitate the removal of the ornate historic iron railway footbridge. There will be substantial harm to the significance of the listed asset due to the severity of changes to its physical appearance and the loss of historic fabric. We recognise that some fabric will be retained for reuse as cladding material, however this will need to be carefully managed to maintain the look of the structure. The stone coursing in the existing bridge runs through the parapets into the wing walls. We would like to see care taken to replicate this effect within the reconstructed bridge to avoid a disjointed appearance to the new structure, which could arise from using mismatched stone-cladded panels. The existing bridge features flat masonry pilasters that project slightly from the bridge to either side of the arch. These have not been articulated in the proposed design and we would like to see further investigation into whether they could be incorporated into the design. This location would be suitable for display of permanent interpretation materials which could help to mitigate some of the harm by informing the public about the history of the route and the upgrade works.

Oaklands Road underbridge MVL3/25 is a skew girder bridge carrying the two-track railway line over a bend in the road below. The angled abutments have distinctive semi-octagonal piers, and the parapets are ornate balustrades of decorative cast-iron panels of Gothic arcading. The craftsmanship of the stonemasonry and attention to architectural detail lifts the design of this bridge above the purely functional and it has considerable architectural interest. There will be substantial harm to the significance of this listed bridge resulting from the proposals to reconstruct and widen the bridge deck and to rebuild the octagonal piers. In order to minimise the harm, the design of the rebuilt piers and abutments will need to be careful managed to ensure there is meaningful articulation of the distinctive shape of the piers. This includes the contrasting shape and dimensions of the piers where they extend through and above the parapet. We are comfortable with the proposals to replicate the decorative cast-iron panels to minimise the visual impact of the loss of the original fabric here.

25 June 2024

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the pre-application meetings over the last five months. These have been extremely useful in explaining the significance of the heritage assets, the design team's approach, and in exploring issues and constraints associated with electrifying the track.

This letter covers our advice regarding proposals for change to eight listed railway structures between Stalybridge and Standedge Tunnel, within the Metropolitan boroughs of Tameside and Oldham in Greater Manchester. This section of the railway is referenced as W2B.

Significance

The section of railway between Stalybridge and Standedge Tunnel was constructed in stages between 1844 and 1849. This was at the height of "railway mania"; an intense period of activity when many competing companies formed and were racing to complete sections of railway. The Stalybridge and Standedge Tunnel railway eventually became part of a wider network of sections of track that extends from Selby and York to Manchester Victoria via Leeds.

The W2B route has considerable heritage value. It traverses areas of dramatic landscape and varied geology, and has remained well preserved and largely unaltered since its opening in the 1840s. The wider railway network from the Yorkshire cities to Manchester contributed hugely to the economic and urban development of the North and was a major factor in the industrial revolution and in the development of towns.

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

The tricky geology and terrain of the W2B route presented challenges to the engineers of the 1840s, and many of the most notable surviving features of the railway are the impressively engineered bridge and viaduct structures. These structures are predominantly built from locally sourced stone, meaning they harmonise with the landscape and contribute to local views, adding to the aesthetic value of the route. The significance of the structures also lies in the fact that they survive well and in large numbers. There have been few alterations to bridges, mainly because this section of the line has not been widened as other parts of the wider route have been.

There are eight listed railway structures that will be affected by the proposed electrification works between Stalybridge and Standedge Tunnel; these are:

- Heyrod Hall Overbridge - MVL3/7
- Heyrod Footbridge Overbridge - MVL3/8
- Spring Bank Lane Overbridge - MVL3/9
- Roughtown Road Overbridge - MVL3/17
- Wright's Mill Overbridge - MVL3/20
- Wright's Overbridge - MVL3/23
- Oldham Road Overbridge - MVL3/28
- Saddleworth Viaduct - MVL3/31

All eight of the listed structures were designed by notable railway engineer Alfred Stanistreet Jee, lead engineer for the railway between Huddersfield and Manchester. They were built in the mid-late 1840s and share many architectural characteristics, adding to their group value and enhancing their significance.

Bridges MVL3/7, MVL3/9, MVL3/17, MVL3/20, MVL3/23, and MVL3/28 are all very similar in design. All are made from coursed local sandstone and have segmental arches formed from tooled voussoirs, with larger keystones. Each has dressed ashlar impost bands, sloping string courses above the arch, and parapet copings, with shallow pyramidal caps to the slender piers. They have considerable group value and are easily identifiable in the landscape as bridges associated with the original construction of the railway. The bridges are all well designed and adapted to their individual locations, some being skewed or sloped. High quality workmanship and

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

details such as picked and tooled ashlar voussoirs elevate their design above what is purely function, enhancing their significance further.

Heyrod Footbridge (MVL3/8) and Saddleworth Viaduct (MVL3/31) are clearly recognisable as part of the same scheme of work but differ in their form. Heyrod Footbridge features a flat span, and retains its cast-iron edge beams and brick parapets, while Saddleworth Viaduct comprises 23 sandstone arches spanning the River Tame and Huddersfield Narrow Canal.

The structures are all Grade II listed in recognition of their special architectural and historic interest at national level. Saddleworth Viaduct was listed in 1986, while all seven overbridges were listed in 2017 or 2018 after a comprehensive review of the line.

Impacts

The proposals involve demolition and reconstruction of three structures, total removal of one structure, and modifications to four structures. These works are deemed necessary to achieve the clearance required for the OLE (overhead line equipment) and to ensure safety for bridge users. The impacts of proposed works at each structure are discussed below.

Bridges requiring demolition works:

Heyrod Hall Overbridge MVL3/7 carries a short section of private road over the railway to Heyrod Hall. This bridge is in a rock cutting with very hard rock beneath the track, prohibiting track lowering.

Wright's Mill Overbridge MVL3/20 carries the public footpath and bridleway over the railway where it passes through a steep-sided rock cutting. Options to lower the track at this bridge have been investigated but discounted due to the location on the bridge in a rock cutting with very hard rock beneath. Track lowering would also have a knock-on effect to a nearby underbridge.

Oldham Road Overbridge MVL3/28 is a skew overbridge located on the north-east side of Greenfield Station and carries Oldham Road over the track below. There will be

Historic England is subject to both the Freedom of Information Act (2000) and Environmental Information Regulations (2004). Any information held by the organisation can be requested for release under this legislation.

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

the addition of a new footbridge alongside the reconstructed road bridge. Options to lower the track at this bridge have been investigated but would be difficult to achieve due to the proximity to the station.

Proposals at these three bridges involves the complete dismantling of each bridge and reconstruction to create a raised, flat deck with sufficient clearance for OLE. Stone would be reclaimed and used to clad the inside faces of parapet walls; however matching stone is likely to be needed to clad the external sides of the parapets. New copers would also be needed to ensure parapets were the correct height.

The demolition and reconstruction of these bridges will cause substantial harm to their significance through the total loss of historic form and loss of much of their original fabric. The proposals will also diminish the group value of the historic bridges on the railway.

Wright's Overbridge MVL3/23 is a footbridge that carries a public footpath from north-west to south-east across the railway. The railway here is in a steep cutting and due to gradients, the bridge slopes down towards the south-east. Proposals involve the total removal of this bridge and diversion of the public right of way across the railway at another point.

The removal of Wright's Overbridge will cause substantial harm to its significance through the total loss of its historic form and all original fabric. Its removal will necessitate the re-routing of a historic public footpath, which is part of a network of paths in the area connecting mills and farms with workers' housing, and contributes to the landscape character of the area and to the setting of the bridge. The proposals will also further diminish the group value of the historic bridges on the railway.

Bridges requiring modifications:

Heyrod Footbridge Overbridge MVL3/8 carries a footpath running east-west over the railway, with steps on the eastern side down to a path running south-east towards Spring Bank Lane which are also listed.

Spring Bank Lane Overbridge MVL3/9 (also known as Heyrod Bridge) carries Spring Bank Lane over the railway. Due to the lie of the land the bridge slopes down towards the east. The splayed projecting wing walls are also covered by the listing.

Historic England is subject to both the Freedom of Information Act (2000) and Environmental Information Regulations (2004). Any information held by the organisation can be requested for release under this legislation.
We respect your privacy and the use of your information. Please read our full privacy policy for more information
https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

Roughtown Road Overbridge MVL3/17 carries Roughtown Road north-south across the railway, to the east of Mossley Station. Due to gradients the deck slopes down towards the south. The projecting wing walls are also covered by the listing.

Minimal interventions are proposed at these three bridges, the most significant changes being the introduction of new triangular copers to ensure the correct and safe parapet heights.

The introduction of triangular copers to raise the parapet heights to 1.5m will result in a low level of less than substantial harm to the significance of the bridges through the changes to their appearance and the loss of original copers. This harm could be further lowed by using stone copers instead of concrete, and by undertaking any other restoration works required such as replacing the recently rendered section of parapet copings in the south-west corner of Roughtown Road Bridge.

Saddleworth Viaduct MVL3/31 (also known as Uppermill Arches and Uppermill Viaduct) carries the railway over a series of roads and lanes, and the River Tame and Huddersfield Narrow Canal. Due to the lack of space available on the viaduct deck, proposals here involve attaching brackets to the exterior of the viaduct for the OLE supports.

The proposed works at Saddleworth Viaduct will result in a low level of less than substantial harm to the significance of the structure through the change to its appearance and in the physical impact on the elevations of the viaduct from the brackets. This harm could be further lowed by ensuring the spacing of the masts responds to the structural and architectural rhythm of the viaduct to lessen their visual impact.

Policy

National policy relating to the conservation and enhancement of the historic environment is articulated in section 16 of the National Planning Policy Framework (NPPF, 2023). These policies state that heritage assets are an irreplaceable resource and should be conserved in a manner appropriate to their significance, so they can be enjoyed for their contribution to the quality of life of existing and future generations (NPPF para 195). Also, when considering the impact of a proposed development, great weight should be given to an asset's conservation (NPPF para 205).

SUITES 3.3 AND 3.4 CANADA HOUSE 3 CHEPSTOW STREET MANCHESTER M1 5FW
Telephone 0161 242 1416
HistoricEngland.org.uk

Historic England is subject to both the Freedom of Information Act (2000) and Environmental Information Regulations (2004). Any information held by the organisation can be requested for release under this legislation.
We respect your privacy and the use of your information. Please read our full privacy policy for more information
https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification (NPPF 206).

Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss. In practice this means that less harmful alternative solutions should be explored through the pre-application and application processes.

In addition to section 16 of the NPPF, we refer you to Section 12 'Achieving well-designed and beautiful places' when considering the design for replacement bridge structures. Para 132 states that being sympathetic to local character and history is important, along with a consistent and high-quality standard of design (para 133).

Position

The proposed works to upgrade the W2B section of the Transpennine route network will be the first major programme of work since its construction in the 1840s. The wider public benefits of the upgrade work to this key transport network will be vast and will have positive knock-on effects across the region. The challenging geology and hydrology across the route still present issues to engineers today, and we welcome the work that has gone into investigating alternative options to demolition and reconstruction for the bridges affected.

The proposals will result in substantial harm to the significance of bridges MVL3/7, MVL3/20, MVL3/23, and MVL3/28, with the highest level of harm to bridge MVL3/23 which will be dismantled and not reconstructed. The proposals will cause harm through the loss of the form of the arched bridges and though the loss of historic fabric. There will be the additional harm to the group value of the bridges.

We agree that the bridges are predominantly experienced from the bridge deck, and that re-use of original fabric should be focussed on the inside faces of the parapet walls to ensure the look of the bridge when crossing it is not unacceptably altered, however this re-use of materials does not lower the harm to less than substantial levels. It will be for decision takers to weigh the balance of this substantial harm against the public benefits of the scheme.

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

Works to bridges MVL3/8, MVL3/9 and MVL3/17 is largely limited to raising the parapets to ensure they are the safe and correct height. We acknowledge that Network Rail has a legal obligation to take reasonable steps to prevent people from coming into contact with the OLE by ensuring parapets cannot be climbed or walked on. We appreciate the work undertaken to investigate various options for different types of pantographs to limit the height at which the parapets need to be raised to. The use of triangular copers will introduce a change in the appearance of the bridges and cause a low level of less than substantial harm to their significance, but the impact can be lessened by use of stone rather than concrete copers which will be less visually obtrusive. Parapet design should be tailored to the individual circumstances of each bridge to ensure the least harmful solution is used.

There will also be a low level of less than substantial harm at Saddleworth Viaduct from the introduction of brackets to the structure to support the OLE. This can be further lowered by thoughtful spacing of the brackets.

We welcome the detailed options appraisals undertaken during the design of the proposed works to listed structures on the W2B route. We recommend that details are finalised using bespoke designs that respond to the particular character of each structure and its setting.

Next Steps

Thank you for involving us at the pre-application stage of this project. The above advice is the response that we would give if the same proposals were put forward unamended for statutory approval.

Yours sincerely

18 July 2025

Dear Sarah

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the recent meetings to review the draft Heritage Statements that will be submitted for Listed Building Consent applications for changes to bridges on the proposed Transpennine Route Upgrade line.

The Heritage Statements are well considered and it is clear that alternative options to reconstruction have been investigated in each case, which are helpfully set out in tables in the reports. The proposals will result in substantial harm to listed bridges along the route, however clear justification for this has been set out in the Heritage Statements.

We very much welcome the inclusion of heritage interpretation at Greenfield Station. This is a significant early rail route and there is notable educational potential in the material that has been generated from the research into the railway structures as part of this project.

Regarding Oaklands Road underbridge MVL3/25, we are comfortable with the design of the proposals for the reconstruction of the parapet and stone turrets. These have been carefully considered to minimise the visual impact.

Next Steps

We appreciate having been involved at pre-application stage in this important project, and value being able to feed into design plans. If you require further pre-application advice please get in touch.

Yours sincerely

1. INTRODUCTION

1.1 Transpennine Route Upgrade

1.1.1 The Transpennine Route Upgrade (TRU) is a major, multi-billion pound program of improvements to increase capacity, improve journey time and reliability performance of rail services on the Transpennine Route.

1.1.2 The TRU will aim to deliver:

- An improved journey time for Leeds – Manchester Victoria of 42-44mins;
- An improved journey time for York to Manchester Victoria of 65-67mins;
- Capability to operate four 'express' and two 'semi-express' services an hour;
- Capability to operate up to two 'local services' an hour on the route;(subject to future operating timetables);
- Performance of the Transpennine Route to be 92.5% or higher each period;
- Larger freight containerisation capability (W12 gauge);
- Freight paths/rights to be retained as existing; and
- A contribution to Network Rail's Decarbonisation Strategy and climate policy.

1.1.3 The Network Rail (Standedge to Diggle (Saddleworth) Enhancement) Order extends from Stalybridge Tunnel, in the west, through to the western portal of Standedge Tunnel (the "Order Scheme"). This section of the Transpennine route follows the Tame Valley from Stalybridge to Diggle, and is referred to hereafter as Route Section W2B.

1.1.4 The TRU programme in Route Section W2B involves a variety of works including the electrification of the railway (installation of overhead line equipment (OLE) and associated infrastructure reconstruction and modification of existing bridges to facilitate electrification of the railway, construction of a new station at Mossley, closure of Stockport Road Level Crossing and Moorgate Halt Level Crossing, railway works at Greenfield Station to support the upgrade and electrification of the railway track reconfiguration works and track lowering works through Stalybridge and Scout Tunnels..

1.1.5 Under the Planning (Listed Buildings and Conservation Areas) Act 1990, consent is required from the local planning authority for any

proposed works that would affect the character of a listed building. The Transport and Works Act 1992 introduced section 12(3A) into the Planning (Listed Buildings and Conservation Areas) Act 1990, the effect of which is to "call-in" for determination by the Secretary of State applications to the local planning authority for listed building consent where such consent is required in consequence of proposals included in an application for a Transport and Works Act Order (TWAO). The procedures in the Transport and Works Applications (Listed Buildings, Conservation Areas and Ancient Monuments Procedure) Regulations 1992 then apply to the call in of such listed building consent applications.

1.1.6 This Heritage Statement has been compiled in support of an application for listed building consent by Network Rail in respect of the proposed works on the grade ll listed Royal George Underbridge (NHLE 1451848). This bridge is located in the village of Grasscroft (NGR SD9859804392), Oldham. A location plan is provided in Appendix A.

1.1.7 The Historic England list description (included in full in Appendix B) names the listed building as “Railway Underbridge MVL3/25, Oaklands Road”. Throughout this Heritage Statement the structure is referred to as “Royal George Underbridge (MVL3/25)” in accordance with Network Rail’s naming of the structure.

1.1.8 The preparation of this assessment has been informed by the Statement of History and Significance: West of Leeds (Alan Baxter Associates, 2024) and the Route-wide Statement of Significance (Alan Baxter Associates, 2019).

1.2 Scope

1.2.1 The requirement for assessment and its scope is guided by policy contained within the National Planning Policy Framework (NPPF, revised 2025), specifically paragraph 207, which seeks an assessment proportionate to the asset’s importance and sufficient to understand the potential impacts of development. The specific scope of this assessment is determined by Network Rail’s requirement to provide an objective assessment of the heritage value of assets that may be affected by the Order Scheme, and to appraise the nature and extent of any impact upon setting and significance.

1.2.2 This Heritage Statement will:

- Identify and discuss the heritage significance of the listed structure, including the contribution of setting;
- Present the design requirements of the Order Scheme at the structure;

- Present the process of development and optioneering which has led to the design proposal for the Order Scheme in relation to the structure;
- Identify the impacts of the design proposal on the significance of the structure, in the context of current national and local planning policy and guidance;
- Discuss any mitigation recommended in relation to the structure; and
- Consider the public benefits to be gained from the Order Scheme weighed against the impact on the significance of the structure, in line with the National Planning Policy Framework, 2025 and the Oldham Joint Core Strategy and Development Management Policies.

1.3 Current Condition

1.3.1 Royal George Underbridge (MVL3/25) (Insert 1-1) is a railway underbridge built in the mid- to late-1840s, designed by A.S. Jee for the Huddersfield and Manchester Railway. In c. 1893, the original cast iron deck was reconstructed however the original substructure, pilasters, cast iron edge beams and parapets were retained. The underbridge is situated on the south-eastern periphery of the village of Grasscroft, c. 5.2 km east of Oldham.

Insert 1-1 Royal George Underbridge (MVL3/25)

1.3.2 The structure was subject to a Detailed Survey as part of Network Rail's maintenance regime in 2019, which found the structure to be in 'poor condition'. At this time, defects included section loss to bottom flanges of main girders, fractures to cast iron parapet screens, displacement of cast iron feature course covers, as well as bulging & displacement to wingwall stonework. Ultrasonic thickness testing to external elevations of the main girders, undertaken in 2021, indicated loss of section of girder webs throughout, and greater loss of section for portion of web buried within ballast.

1.3.3 An additional inspection was undertaken in 2023, with the examination report noting the following defects:

- Failure of protective paint system with localised corrosion throughout deck;
- Vertical stepped fractures and deep open joints to pilasters and abutments; and
- Deep open joints and loose to hammer brickwork to ballast walls.

1.3.4 The structure was reassessed under line closure in August 2024. This enabled inspection of hidden critical elements with 6 trial pits requiring removal of ballast to examine the two inner steel girders. Inspection of the trial pits identified the following:

- In some areas rivets were in very poor condition, with instances where the heads were completely corroded;
- Widespread corrosion to web, varying from 2mm-5mm loss of material.
- Widespread corrosion to steel angles between web and flange, causing loss of up to 5mm of steel; and
- Water pooling on top of concrete deck, circa 15mm deep.

1.3.5 Further detailed assessment was undertaken in November 2024. The assessment included 6 trial pits requiring the removal of ballast in order to undertake a visual inspection of the two outer steel girders. The inspection identified the following defects:

- Water was noted to be pooling at the base of one of the trial pits;
- Rivet heads and angle between web and flange noted to be in poor condition in numerous places;
- In three of the trial pit locations the web of the girder was found to be in poor condition with instances of corrosion and delamination. At one location a hole within the girder web was identified;

- Ultrasonic thickness testing of the girder webs was undertaken in three locations with thickness varying from 3.9 mm to 9.7 mm;
- Two of the trial pits revealed portions of the girder flange to be in very poor condition, with pieces of corrosion easily broken away;
- The girder stiffener was revealed to be in poor condition in one of the trial pits, with sections fully corroded and steel only 10mm thick where it remains; and
- In some areas the concrete covering the girder web was coming away and easy to remove, this deterioration could allow water to come into contact with portions of the web hidden from view.

1.3.6 The inspections enabled by the hand digging of trial pits have revealed substantial areas of corrosion, with portions of the girders in poor condition. The findings are limited to those areas revealed by the trial pits. However, those areas inspected have revealed the steelwork is deteriorating which needs to be taken into account when considering potential increases in line speed or loading.

1.4 Summary of proposal

1.4.1 In order to achieve the TRU Programme objectives, electrification of the Route is required. This would require the alteration of a number of existing underbridges, including Royal George Underbridge (MVL3/25) to accommodate OLE, higher line speed and increased freight trains. It has been determined to be necessary to reconstruct the underbridge. These works would therefore enable implementation of the Order Scheme.

2. LEGISLATION AND POLICY CONTEXT

2.1 Legislation

2.1.1 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) (the "Act") governs the designation and works to listed buildings in England.

2.1.2 The Act states in s.1 (5):

'In this Act "listed building" means a building which is for the time being included in a list compiled or approved by the Secretary of State under this section; and for the purposes of this Act—

(a) any object or structure fixed to the building;

(b) any object or structure within the curtilage of the building which, although not fixed to the building, forms part of the land and has done so since before 1st July 1948, shall be treated as part of the building.'

2.1.3 Under the Act, no one is permitted to undertake or cause to be undertaken any works that would affect the character of a listed building unless the works are authorised. Section 16 of the Act identifies that whether such works can be carried out is determined by the local planning authority or the Secretary of State:

'(1) Subject to the previous provisions of this Part, the local planning authority or, as the case may be, the Secretary of State may grant or refuse an application for listed building consent and, if they grant consent, may grant it subject to conditions.

(2) In considering whether to grant listed building consent for any works the local planning authority or the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses.

(3) Any listed building consent shall (except in so far as it otherwise provides) ensure for the benefit of the building and of all persons for the time being interested in it.'

2.1.4 In relation to the granting of listed building consent, Section 17 of the Act stipulates that conditions attached listed building consent may include those with respect to:

'(a) the preservation of particular features of the building, either as part of it or after severance from it;

(b) the making good, after the works are completed, of any damage caused to the building by the works; [and]

(c) the reconstruction of the building or any part of it following the execution of any works, with the use of original materials so far as practicable and with such alterations of the interior of the building as may be specified in the conditions.'

It is also defined in s.17 (2) that a condition *'may also be imposed requiring specified details of the works (whether or not set out in the application) to be approved subsequently by the local planning authority or, in the case of consent granted by the Secretary of State, specifying whether such details are to be approved by the local planning authority or by him'.*

2.1.5 The Act also states in s.66 (1):

'In considering whether to grant planning permission or permission in principle for development which affects a listed building or its setting, the local planning authority or, as the case may be, the

Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses'.

2.1.6 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) also governs duties of the local planning authority relating to conservation areas, particularly Sections 69, 72 and 74.

- Section 69 requires local planning authorities to define as conservation areas any '*areas of special architectural or historic interest the character or appearance of which it is desirable to preserve or enhance'*.
- Section 72 confers a general duty '*with respect to any buildings or other land in a conservation area… special attention shall be paid to the desirability or preserving or enhancing the character or appearance of that area'*.
- Section 74 defines that demolition of a building in a conservation area is not permitted '*without the consent of the appropriate authority'*.

2.2 National Policy

2.2.1 The National Planning Policy Framework (NPPF, 2025) sets out the Government's planning policies for England and how these should be applied to contribute to the achievement of sustainable development, supported by the Planning Practice Guidance (updated July 2019) (MHCLG, 2019).

2.2.2 Section 2 of the NPPF outlines the principles of achieving sustainable development including, in Paragraph 8, an environmental objective '*to protect and enhance our natural, built and historic environment*'. Paragraph 9 sets out that these objectives should be delivered through the preparation and implementation of plans and the application of the policies within the NPPF.

2.2.3 This Heritage Statement aims to address relevant policy within the NPPF in relation to Section 16 'Conserving and enhancing the historic environment'. This sets out a clear framework to ensure that heritage assets are conserved, and where appropriate enhanced, in a manner that is consistent with their significance. It also includes guidance on assessment of significance of heritage assets and their settings that may be affected by the proposed works and how to consider potential impacts on significance.

2.2.4 The following paragraphs as set out in the NPPF include key provisions considered of particular importance to this application:

- Paragraph 207 – '*In determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand the potential impact of the proposal on their significance*.'
- Paragraph 212 – '*When considering the impact of a proposed development on the significance of a designated heritage asset, great weight should be given to the asset's conservation (and the more important the asset, the greater the weight should be). This is irrespective of whether any potential harm amounts to substantial harm, total loss, or less than substantial harm to its significance*.'
- Paragraph 213 – '*Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification. Substantial harm to or loss of:*

  a) grade II listed buildings, or grade II registered parks or gardens, should be exceptional;

  b) assets of the highest significance, notably scheduled monuments, protected wreck sites, registered battlefields, grade I and II listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional.'*

- Paragraph 214 – *'Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is* necessary *to achieve substantial public benefits that outweigh that harm or loss, or all of the following apply:*

  a) the nature of the heritage asset prevents all reasonable uses of the site; and

  b) no viable use of the heritage asset itself can be found in the medium term through appropriate marketing that will enable its conservation; and

  c) conservation by grant-funding or some form of not for profit, charitable or public ownership is demonstrably not possible; and

  d) the harm or loss is outweighed by the benefit of bringing the site back into use.'

- Paragraph 215 – '*Where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate, securing its optimum viable use*.'
- Paragraph 219 - '*Local planning authorities should look for opportunities for new development within Conservation Areas and World Heritage Sites, and within the setting of heritage assets, to enhance or better reveal their significance. Proposals that preserve those elements of the setting that make a positive contribution to the asset (or which better reveal its significance) should be treated favourably*.'

Planning Practice Guidance

2.2.5 The Planning Practice Guidance (PPG) (MHCLG, 2019) provides further advice and guidance that expands the policy outlined in the NPPF. It expands on terms such as 'significance' and its importance in decision making. The PPG clarifies that being able to properly assess the nature, extent and the importance of the significance of the heritage asset and the contribution of its setting, is very important to understanding the potential impact and acceptability of development proposals (paragraph 008 Reference ID: 18a-008-20190723).

2.2.6 The PPG states that in relation to setting, a thorough assessment of the impact on setting needs to take in to account, and be proportionate to, the significance of the heritage asset under consideration and the degree to which proposed changes enhance or detract from that significance and the ability to appreciate it (paragraph 009 Reference ID: 18a-009-20190723).

2.2.7 The extent and importance of setting is often expressed by reference to visual considerations. Although views of or from an asset will play an important part, the way in which an asset is experienced in its setting is also influenced by other environmental factors such as noise, dust and vibration from other land uses in the vicinity, and by our understanding of the historic relationship between places.

2.2.8 Paragraph 013 of the PPG recognises that the contribution that setting makes to the significance of the heritage asset does not depend on there being public right or the ability to experience that setting. When assessing any application for development which may affect the setting of a heritage asset, local planning authorities may also need to consider the implications of cumulative change (Paragraph: 013 Reference ID: 18a-013-20190723 Revision date: 23 07 2019).

2.2.9 In relation to substantial harm, the PPG states that '*it is the degree of harm to the asset's significance rather than the scale of the development that is to be assessed*' (paragraph 017). Harm to heritage assets can be avoided or minimised if proposals are based on a clear understanding of the heritage asset and its setting (paragraph 008 Reference ID: 18a-008-20190723). The NPPF indicates that the degree of harm should be considered alongside any public benefits that can be delivered by development.

2.3 Local planning policy

Oldham Joint Core Strategy and Development Policies

2.3.1 Local planning policy for Oldham Metropolitan Borough Council (OMBC) is provided by the Joint Core Strategy and Development Management Policies of the Oldham Local Development Framework, adopted in November 2011 (Oldham Council, 2011), adopted in November 2011, and a small number of retained policies from the Unitary Development Plan (Oldham Council, 2009). Policy 24 relates to the Historic Environment and is reproduced in full below:

Policy 24 Historic Environment

'Oldham has a rich historic environment with many significant and valuable features, structures and characteristics. The council will protect, conserve and enhance these heritage assets and their settings which adds to the borough's sense of place and identity.

Development proposals must have regard to:

- *National and local guidance and policies on the historic environment.*
- *Oldham Rochdale Housing Market Renewal Pathfinder Heritage Assessments.*
- *Greater Manchester and Oldham Urban Historic Landscape Characterisation Study.*
- *Conservation Area Appraisals and Management Plans, where appropriate.*

When allocating sites and determining applications for planning and advertisement consents, the council will seek to protect, conserve and enhance the architectural features, structures, settings, historic character and significance of the borough's heritage assets and designations including:

a. *Listed buildings.*

b. Conservation areas.

c. Registered parks and gardens (their historic character and setting).

d. Scheduled ancient monuments (their archaeological value and interest).

e. Significant archaeological remains.

f. Locally significant buildings, structures, areas or landscapes of architectural or historic interest (including non-designated locally significant assets identified in the local lists compiled by the council).

The council will support heritage-led regeneration, including the reuse of historic buildings such as mills, to achieve economic, community and regeneration objectives, where appropriate.

Listed Buildings

Development to, or within the curtilage or vicinity of, a listed building or structure must serve to preserve or enhance its special interest and its setting. There will be a strong presumption against proposals involving the demolition of listed buildings or structures. Proposals which would lead to the loss or cause harm to grade I and II listed buildings should be wholly exceptional. Development proposals for a building incorporating a historic shop front should make provision for its retention, restoration and repair.*

Conservation Areas

Development within or affecting the setting of a conservation area, including views in or out, must serve to preserve or enhance the character or appearance of the area. Proposals for all new development, including alterations and extensions to buildings and their re-use, must have a sensitive and appropriate response to context and good attention to detail. Proposals must not adversely affect important architectural or historic features or distinctive local features or structures unless it can be demonstrated that the development brings substantial benefits to the community. Proposals for the demolition of a building in a conservation area must demonstrate that it is unrealistic for the building to continue in its existing use and a suitable alternative use cannot be found, or the building is in poor structural condition and the cost of repairing and maintaining it would be disproportionate to its importance and value and the demolition would preserve or enhance the character or appearance of the conservation area. In exceptional circumstances,

the fact that a demolition would bring substantial benefits to the local community may outweigh the balance in favour of the preservation of the building.

Local Designations

Development which would affect the following designations will only be permitted in cases where it can be demonstrated that the benefits of the development brings substantial benefits to the community which outweigh the preservation of the heritage asset:

- Significant archaeological remains.
- Locally significant buildings, structures, areas or landscapes of architectural or historic interest.'

Places for Everyone (Greater Manchester Combined Authority 2024)

2.3.2 Places for Everyone (Greater Manchester Combined Authority 2024) is a joint development plan covering nine Greater Manchester districts including Oldham, setting out a framework for sustainable development. Policy JP-P2 concerns Heritage and is of relevance to this assessment:

Policy JP-P2: Heritage

We will proactively manage and work with partners to positively conserve, sustain and enhance our historic environment and heritage assets and their settings. Opportunities will be pursued to aid the promotion, enjoyment, understanding and interpretation of heritage assets, as a means of maximising wider public benefits and reinforcing Greater Manchester's distinct character, identity and sense of place.

Local Plans will set out the key elements which contribute to the district's identity, character and distinctiveness and which should be the priority for conserving and enhancing in the future and demonstrate a clear understanding of the historic environment and the heritage values of sites, buildings or areas and their relationship with their surroundings. This knowledge should be used to inform the positive management and integration of our heritage by:

1. *Setting out a clear vision that recognises and embeds the role of heritage in place-making;*

2. *Ensuring that the heritage significance of a site or area is considered in accordance with national planning policy in the planning and design process and opportunities for interpretation and local engagement are optimised;*

3. *Integrating the conservation and enhancement of heritage assets and their settings, with creative contextual architectural responses that contribute to their significance and sense of place;*

4. *Delivering positive benefits that sustain and enhance the historic environment, as well as contributing to the economic viability, accessibility and environmental quality of a place, and to social wellbeing; and*

5. *Exploring opportunities to reduce greenhouse gas emissions that restoration of historic buildings offer.*

Particular consideration will be given to ensure that the significance of key elements of the historic environment which contribute to Greater Manchester's distinctive identity and sense of place are protected from harm. These include historic town centres, places of worship, historic transport routes including the canal network, industrial buildings and structures including textile mills, farmsteads and other sites, buildings, and areas of identified archaeological, architectural, artistic and/or historic value. Development proposals affecting designated and non-designated heritage assets and/or their settings will be considered having regard to national planning policy. Where heritage assets have been identified as being at risk, Local Plans should identify specific opportunities for them to contribute to regeneration and place-making, and they should set out strategies for their repair and re-use. Development proposals which will help safeguard the significance of and secure a sustainable future for Greater Manchester's heritage at risk will be supported in principle, provided they are not contrary to national policy or other policies in the development plan. Proposals should be informed, as necessary, by the findings and recommendations of the appropriate heritage assessment(s) in the development plan evidence base and/or any updated heritage assessment submitted as part of the planning application process.

2.4 Historic England Guidance

2.4.1 Historic England has published a series of Good Practice Advice (GPA) notes and Advice Notes (AN) of which those of most relevance to this appraisal are GPA2 – Managing Significance in Decision-taking (Historic England. 2015), GPA3 – The Setting of Heritage Assets (Historic England, 2017), and AN12, Statements of Heritage Significance (Historic England, 2019).

2.4.2 GPA2 – Managing Significance in Decision-taking emphasises the importance of having a knowledge and understanding of the significance of heritage assets likely to be affected by the development and that the *'first step for all applicants is to understand the significance of any affected heritage asset and, if relevant the contribution of its setting to its significance'* (paragraph 4). Early knowledge of this information is also useful to a local planning authority in pre-application engagement with an applicant and ultimately in decision making (paragraph 7).

2.4.3 GPA3 – The Setting of Heritage Assets provides advice on the setting of heritage assets. Setting is as defined in the NPPF and comprises the surroundings in which a heritage asset is experienced. Elements of a setting can make positive or negative contributions to the significance of an asset and affect the ways in which it is experienced. Historic England state that setting does not have a boundary and what comprises an asset's setting may change as the asset and its surrounding evolve. Setting can be extensive and particularly in urban areas or extensive landscapes can overlap with other assets. The contribution of setting to the significance of an asset is often expressed by reference to views and the GPA in paragraph 11 identifies those views, such as those that were designed or those that were intended, that contribute to understanding the significance of assets.

2.4.4 AN12, Statements of Heritage Significance outlines a recommended approach to assessing the significance of heritage assets in line with the requirements of NPPF. It includes a suggested reporting structure for a 'Statement of Heritage Significance', as well as guidance on creating a statement that is proportionate to the asset's significance and the potential degree of impact of a proposed development. The AN also offers an interpretation of the various forms of heritage interest that an asset can possess, based on the terms provided in the NPPF Glossary (Annex 2); namely archaeological, architectural, artistic, and historic.

3. ASSESSMENT METHODOLOGY

3.1 Research

3.1.1 In accordance with Historic England guidance and as determined by policy requirements, this assessment identifies the baseline heritage interest of Royal George Underbridge (MVL3/25). The historical narrative informing the baseline has been derived from a review of various sources including maps and other cartographic and photographic sources. Statutory information in relation to the designated asset has been obtained from the National Heritage List for England maintained by Historic England and the Historic

Environment Record maintained by Greater Manchester Archaeology Advisory Service.

3.1.2 Additional information concerning the asset, ite condition, use and setting has been obtained from a walkover survey undertaken by suitably qualified and experienced heritage specialists on 21 and 22 May 2024, including observation from surrounding vantage points and informed by appraisal and observation derived from close working with other disciplines within the project team.

3.2 Significance and setting

3.2.1 Assessment of the significance of the heritage asset and its setting has been undertaken in consideration of guidance issued by Historic England. Significance is often established by statutory designations such as listed buildings, scheduled monuments and conservation areas. More particular advice as to what makes up significance is set out in AN12, which establishes a method for thinking consistently about the heritage values that can be ascribed to a place. When making an assessment of significance, numerous aspects are considered including architectural interest, historic interest, group value, social value, former uses and local distinctiveness. These aspects are grouped into four values defined in Annex 2 of the NPPF as historical interest, archaeological interest, artistic interest, and architectural interest.

3.2.2 In assessing whether the setting of an asset contributes to its significance, and in assessing the effect of development, Historic England GPA3 provides a checklist of attributes that may affect setting and significance under five broad categories comprising:

- the location and siting of the development;
- the form and appearance of the development;
- additional effects (change to skyline etc.);
- permanence; and
- consequential effects.

4. CONSULTATION

4.1.1 Historic England and OMBC have been involved in ongoing stakeholder consultation with Network Rail through the development of Route Section W2B of the TRU.

4.1.2 Regular meetings with Historic England and OMBC have been held to discuss the design development of the proposal in relation to Royal George Underbridge (MVL3/25). Initial meetings were held periodically throughout 2021, and resumed in 2024 to discuss the

overall route and design development for all structures along the Route Section W2B.

4.1.3 The design development for Royal George Underbridge (MVL3/25) was presented and discussed with the historic environment stakeholders on the following dates:

Table 4-1 Consultation for Royal George Underbridge (MVL3/25)

Date	Stakeholder in attendance	Key agreements/items discussed
27 January 2021	• OMBC	• Meeting to present the overview and scope of Route Section W2B within Oldham Council. • Overview of the Order Scheme was presented including the inventory of structures within the council's jurisdiction of which Royal George Underbridge (MVL3/25) forms one of 12 underbridges.
15 February 2021	• OMBC	• Project briefing on the bridge structures in order to identify the location and Order Scheme output, Network Rail electrification challenge, structures overview and next steps. • Structures presentation included Royal George Underbridge (MVL3/25) and identified that works would be required to allow for an increase in line speed. Assurance that Network Rail would not want to reduce headroom and any refurbishment would be sympathetic to the historic design of the bridge, in response to council concerns regarding impact and sensitivity of the design.
26 May 2021	• OMBC • Tameside Metropolitan Borough Council (TMBC) • Historic England	• Overview of the structures along Route Section W2B which are of historic interest, such as the grade II underbridges including Royal George Underbridge (MVL3/25) which are noted for their significance, particularly as essential railway structures and their shared common themes, significance and group value. Royal Goerge Underbridge (MVL3/25) was also acknowledged as being the only underbridge within this route section with metallic parapets. Acknowledgement that

Date	Stakeholder in attendance	Key agreements/items discussed
		these are monumental examples of 19th century engineering and prominent elements of local townscape and landscape. • Presentation of the purpose of Heritage Statements and their assessment of impact with the emerging GRIP 3 designs[1]. • Early-stage recommendations to minimise harm to significance against the requirements for justification of proposals and opportunities to pursue sensitive design and compensation. • Reassurance was provided to the council that they will be involved in the GRIP 3 design process which will be used within the detailed design development of GRIP 4. Clarification was also provided on the sustainable heritage initiatives. • Historic England stated that they expect to get an understanding of significance at this stage and that they anticipate options to be shared for comment. Also stressed the importance of minimising harm.
6 February 2024	• Historic England	• Overview of listed structure, and details of the challenges of the electrification of the route in relation to listed overbridges were presented. • The design approach for electrification across / under existing railway bridges was noted to have been agreed in principle by Network Rail and following consultation with the Local Authorities & Historic England at the preceding design stage.

[1] At the time of consultation in 2021, the delivery of railway investment programmes was managed by Network Rail as a staged process through use of the GRIP (Governance for Railway Investment Projects) process. GRIP 3 comprised option selection. This has since been replaced by PACE (Project Acceleration in a Controlled Environment).

Date	Stakeholder in attendance	Key agreements/items discussed
22 April 2024	• Oldham Council	• Overview of preferred options for structures along the route within Oldham. This included the preferred option for Royal George Underbridge (MVL3/25) which consists of steelwork strengthening and bonding, ballast beams required.
7 May 2024	• Historic England	• Progress with next steps of the design for works proposed to Underbridges involving track alignment which includes Royal George Underbridge (MVL3/25), which is the only non-masonry arch bridge of the underbridges within this part of the Order Scheme. • Awaiting track design before progressing.
24 April 2024	• OMBC	• Network Rail presented an overview of structures within Oldham to the council, which included Royal George Underbridge (MVL3/25) and discussed: steelwork strengthening and bonding, ballast retention and GRP handrail on wingwall.
21 November 2024	• Historic England	• Presentation of revised proposals for Royal George Underbridge (MVL3/25) which is now being proposed as a reconstruction due to poor structural condition. • Historic England accepted the need for reconstruction, and acknowledged harm to the listed structure resulting from this. • Key design features were identified to include the octagonal turrets and gothic parapets. • The need to widen bridge and alter the turrets was discussed and the need for a sensitive design solution which maintained the definition of the turrets was identified. Replication of the existing parapet and spacing of OLE masts to avoid the bridge were welcomed by Historic England. • The visibility of the bridge to the public was highlighted by Historic England increasing the sensitivity of the reconstruction proposals. • Potential for permanent interpretation at this location noted and welcomed by Historic England.

Date	Stakeholder in attendance	Key agreements/items discussed
4 December 2024	• Historic England	• Network Rail presented four high level options for the reconstruction of Royal George Underbridge (MVL3/25): 1. Reconstruction with pilasters to match existing geometry, resulting in a loss of section from the turrets to accommodate the widened deck. 2. Projection of pilaster at base of new cill units with a string course which steps out relative to the pilaster. This option would retain full extent of pilaster to interface with parapet. 3. 200mm step out of pilaster at existing string course, level with pilaster flush to string course. Pilaster shape adjusted to provide five faces of octagonal shape similar to existing. 4. 250mm step out of pilaster at existing string course level. The pilaster step in from string course as existing and the pilaster shape would be adjusted to provide five faces of octagonal shape. • Historic England identified Option 1 as preferred. • Materials for reconstruction discussed. Use of natural stone and concrete for feature lines, similar to other reconstructed structures noted. Potential for use of stone for capping of turrets also noted.
19 December 2024	• OMBC	• Meeting held with officers from the Highways department at OMBC, in which an overview of the proposed works to MVL3/25 were presented. • It was highlighted by Network Rail that the heritage significance of the bridge has been fully considered, with ongoing pre-application engagement with Historic England taking place. • Specific queries relating to highway safety (including risk of bridge strikes, nature of headroom signage) were discussed.

Date	Stakeholder in attendance	Key agreements/items discussed
		• The proposed construction methodology was discussed, along with the consideration needed to be given to sequencing the proposed works at MVL3/25 and MVL3/28 at different times to minimise disruption to diversionary highways routes, and engagement with nearby stakeholders. • OMBC Highways officers noted an understanding about why the proposed works are required and that engagement with Historic England is beneficial.
19 February 2025	• Historic England	• Presentation of developing proposals for MVL3/25 to Historic England. • Requirement for protection of bridge deck from vehicle strike and difference in headroom between the bridge elevations due to slope on road acknowledged. • Proposal to increase the depth of the southern edge beam to match that to the northern edge beam agreed. Articulation of the south beam agreed, and noted to enable understanding of the deeper beam as a safety feature.
27 February 2025	• Historic England	• Presentation of the deeper downhill beam to Historic England who expressed content with this design as well as with the continuation of the string course from the turrets across the deck. • Confirmation that Option 1 for the design for the new turrets is still the agreed approach.
02 April 2025	• OMBC	• Presentation of overview of the aims and objectives of TRU to OMBC heritage officers, with emphasis on the historic context of Route Section W2B and the 12 listed building consents applications which are being prepared for the various works to the grade II listed bridges and viaduct along the route section. • Presentation of overview of electrification challenges caused by the existing arch profile of a number of existing bridges

Date	Stakeholder in attendance	Key agreements/items discussed
		and have developed bespoke solutions for these to achieve the required clearance. • Overview of the current status of each structure within OMBC's jurisdiction, including the reconstruction of Royal George Underbridge (MVL3/25). Network Rail identified that the current structure would not be capable of accommodating the OLE, higher line speed and increased freight trains associated with the Transpennine Route Upgrade due to its poor condition and that proposals to reconstruct the structure have been progressed. The reconstruction would seek to rebuild the piers, abutments and replicate the cast iron parapets.
2 June 2025	• Historic England	• Feedback from Historic England following receipt of the draft listed building consent package for Royal George Underbridge (MVL3/25). • Raising of bridge deck noted, providing additional headroom. Appearance and proportions of proposed structure noted by Historic England to be successful, with the alignment of the parapet with the turrets being an important aspect of this.
24 June 2025	• OMBC	• Pre-application advice letter received from OMBC outlining local planning authority advice following review of the draft listed building consent application material. • OMBC found that the reconstruction of Royal George Underbridge (MVL3/25) would result in substantial harm through the loss of its historic form and much of the original fabric. • OMBC highlight that clear and convincing justification will be required for any harm arising to designated heritage assets, with substantial benefits required to outweigh substantial harm.

Date	Stakeholder in attendance	Key agreements/items discussed
		• A high level of harm was also found to the group value of the bridges designed by A.S Jee on the TransPennine Route, due to the proposed demolition of Wright's Overbridge (MVL3/23) and reconstruction of four other bridges (including Royal George Underbridge (MVL3/25), and a limited level of harm to group value arising from the alteration of three other structures
18 July 2025	• Historic England	• Pre-application advice letter received from Historic England providing overarching feedback on proposals affecting listed bridges between Stalybridge and Standedge Tunnel (see Appendix C). • Historic England state they are comfortable with the design of the proposals for reconstruction of the parapet and stone turrets at Royal George Underbridge (MVL3/25), which have been carefully considered to minimise visual impact. • Acknowledgment given to the collaborative approach taken at pre-application stage, to fully explore alternative options to reconstruction and for the opportunity for Historic England to feed into design plans. • The heritage statements adjudged to be well considered with clear justification having been provided for the substantial harm identified to those structures proposed for removal or reconstruction. • The inclusion of interpretation at Greenfield Station is welcomed by Historic England.

5. HERITAGE ASSSETS AND THEIR SIGNIFICANCE

5.1 History of the W2B Transpennine Route

5.1.1 The railway connecting Stalybridge to Huddersfield, which runs over Royal George Underbridge (MVL3/25) was constructed by the Huddersfield & Manchester Railway Company between 1846 and 1849. The mid-1840s was a period of commercial confidence and massive expansion in the railway network across England, known as 'Railway Mania' which has been described by Historic England as the Heroic Age of railway building (Historic England, 2017). Between 1845 and 1852 the railway network expanded from 2,345 miles to 7,272 miles (3774km to 11,703km) (Alan Baxter Associates, 2019). Constructed at the height of this boom, the Stalybridge to Leeds line was a product of this trend. Traversing a challenging landscape through the Pennines, the line was planned to follow the route of the Huddersfield Narrow Canal for much of its length, with the canal acquired by the Railway Company the year after its authorisation (Alan Baxter Associates, 2019). These difficult landscape conditions resulted in the need to build several major viaducts and tunnels. These included Standedge Tunnel through the Pennines, which was constructed alongside the 1811 canal tunnel and is *'indisputably significant as a major engineering achievement'* (Alan Baxter Associates, 2024*).*

5.1.2 The development and expansion of the railways during the 19th century transformed the landscape and settlements through which they passed, fuelling industrial growth and settlement expansion. The impact of improved communications, first with the arrival of the canal in 1811, and then the railway in 1849, provided valuable links with Huddersfield, Manchester and Leeds, enabling import of raw materials and export of manufactured goods. This fuelled the gradual industrialisation and settlement expansion along the Tame Valley. This can be seen on historic Ordnance Survey maps dating from the 19th and early 20th century where industrial development including mills, dyeworks, printworks and quarries, is shown to have been present along the route of the railway and extending into the more upland areas around Saddleworth and Harropdale, whilst settlements such as Mossley and Dobcross gradually expanded.

5.1.3 Royal George Underbridge (MVL3/25) was constructed for the Huddersfield & Manchester Railway Company in the mid to late 1840s. The principal engineer for the Huddersfield & Manchester Railway was Alfred Stanistreet (A.S.) Jee (1816–1858), who was assisted by the more renowned engineer Joseph Locke (1805–1860). Jee's work on the Huddersfield & Manchester Railway represents, arguably, his greatest achievement. This can be seen particularly in the construction of the Standedge Tunnel, which at

over three miles long was one of the longest and most difficult in England, but also through the various large-scale viaducts along the route. In the 1850s, he worked internationally on the Spanish line from Alar-del-Rey to Reynosa where his skill in design, his accuracy and his completeness of the details earned him high praise. He died in a fatal accident upon the opening of the second portion of that line.

5.1.4 In 1847, prior to the opening of the line, the Huddersfield & Manchester Railway Company was taken over by the London and North Western Railway (LNWR). As part of the LNWR network, the Huddersfield & Manchester Railway formed part of a direct route from Manchester to the West Riding, enabling the LNWR to access the textile and coal industries of West Yorkshire. By 1851, the LNWR was the most prominent railway company of the period, with over 800 miles of track and was the largest joint-stock concern of its time, capitalised at £29 million. The line was acquired by the London Midland and Scottish Railway in 1923, before being nationalised in 1948.

5.1.5 Whilst other parts of the Transpennine route were subject to significant alterations, the Huddersfield & Manchester Railway between Standedge Tunnel and Stalybridge was subject to relatively limited alteration. The Micklehurst Loop was constructed from 1881-85 to provide additional capacity, and diverged from the existing railway to the east of the Tame Vally, avoiding physical interaction with the majority of its alignment. A new junction to the south of Greenfield Station is shown on historic maps from the early 20th century as additional tracks toward Oldham were established from this station. However, similarly to the Micklehurst loop, the additional lines diverged from the main Huddersfield line, running westwards at its intersection with Shaw Hall Bank Road Footway (MVL3/26). The railway was also widened to the east of Diggle to accommodate additional tracks serving new bores for the Standedge Tunnel which were added in 1868-71 and 1894, necessitating widening of bridges to the east of the route.

5.1.6 Piecemeal change has occurred, most notably with the closure of a small number of stations along the route, such as Diggle and Saddleworth Stations. The route today forms part of the wider Trans-Pennine Route between York, Selby and Manchester, which comprises sections of rail line developed by different railway companies.

5.1.7 The history and significance of the Trans-Pennine Route is discussed at more length in the Route-Wide Statement of Significance (Alan Baxter Associate, 2019). This was produced to characterise the overall heritage significance of the Transpennine route as a whole.

5.2 Royal George Underbridge (MVL3/25)

History

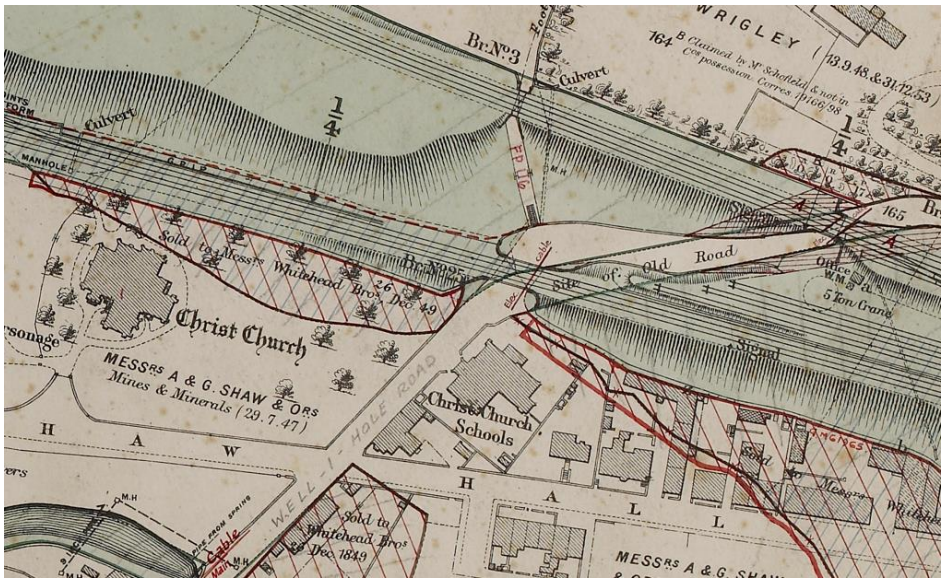
5.2.1 Royal George Underbridge (MVL3/25) was constructed between 1845 and 1849 during the Heroic Age of railway building (1841-1850). The single-span bridge was designed by A.S. Jee for the Huddersfield & Manchester Railway, carrying the railway over Oaklands Road. The underbridge maintained access between the north and south of the valley, and was named after the Royal George Mill, located c. 380m south of the railway line.

5.2.2 Royal George Underbridge (MVL3/25) was originally constructed as a cast iron beam bridge which was a common building material for railway bridges until the 1840s. However, failures in the materials and concerns over structural capacity resulted in the decline of its use, and widespread replacement of cast iron in existing structures. In c. 1893, the cast iron deck at Royal George Underbridge (MVL3/25) was replaced with a steel girder deck, however the original cast iron fascia beams and parapets were retained. Whilst it is the only bridge with cast iron elements along this section of the former Huddersfield & Manchester Railway, other bridges along the wider Transpennine route also feature cast iron elements and survive as a record of this period of construction.

5.2.3 Royal George Underbridge (MVL3/25) was first depicted on the 1848 six-inch Ordnance Survey map, as shown carrying the railway over a road linking Grasscroft with Royal George woollen mills to the southwest. Royal George Mill began operation in 1786 originally under the name Gibbs Mill before changing its name to Royal George Mill in 1800. The mill gained international recognition and remained in operational use until its gradually declined in the 1990s and closure in 1999 (National Archives).

5.2.4 The environs of the underbridge are characterised by former workers' cottages which line the streets across the valley, with the mid 19th century Christ Church (grade II, NHLE 1356701) shown to the immediate southwest of the underbridge. The church was built by George Shaw on land purchased by LNWR in 1849 (Barrow *et al.* 2023, p.88). Piecemeal residential and industrial activity established in a rural and undulating landscape, particularly along Church Road and Shaw Bank Hall Road.

5.2.5 Subsequent historic mapping shows no further alterations to the underbridge.

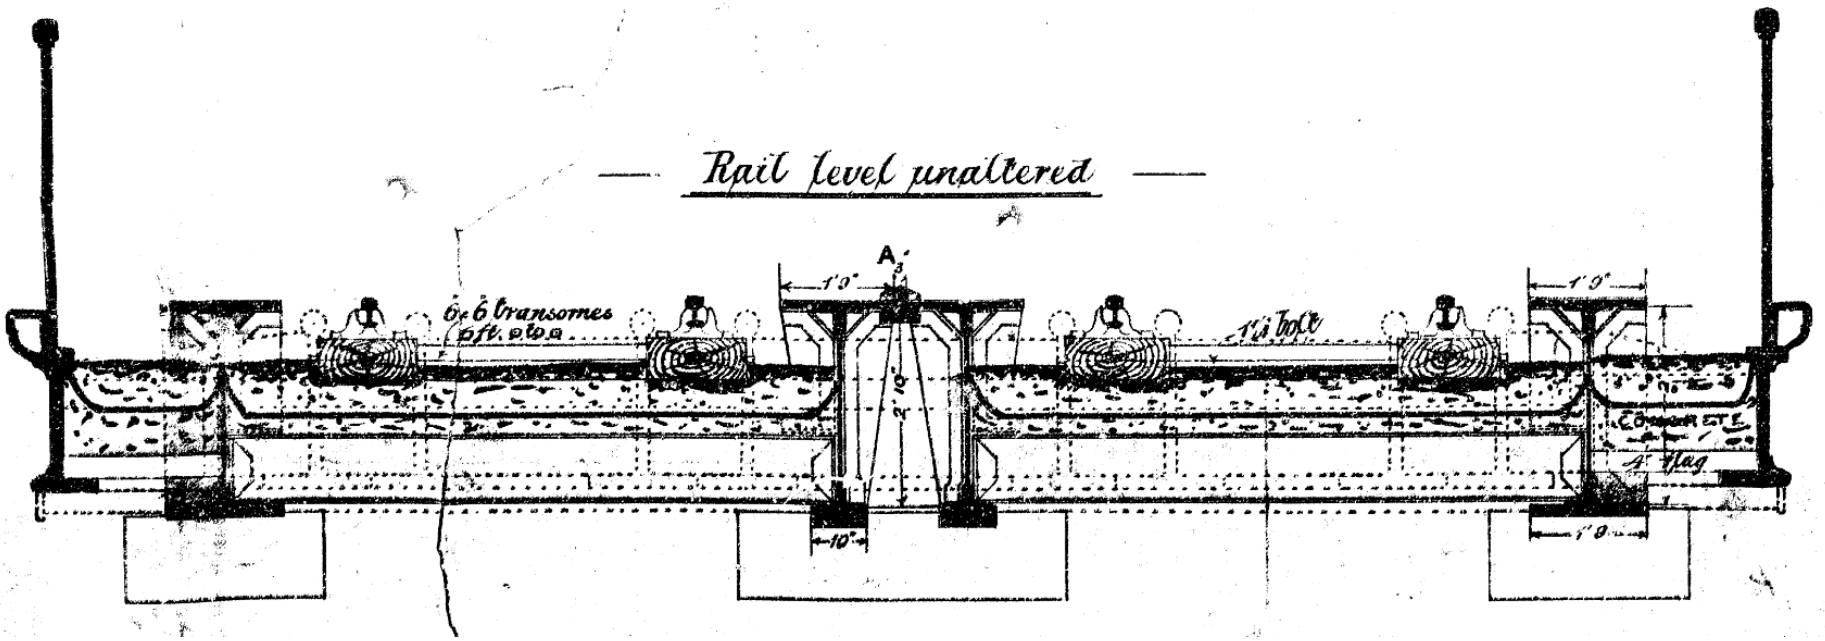


Insert 5-1 Historic line plan of Huddersfield and Manchester Railway and Canal by LNWR in 1905 in which Royal George Underbridge (MVL3/25) is illustrated.

Description

5.2.6 Royal George Underbridge (MVL3/25) comprises a single span girder bridge carrying the two-track railway line over Oaklands Road. The bridge has skew abutments with semi-octagonal piers of squared and rusticated stone blocks with chamfered edges. The piers narrow above a projecting string course at track level, above which they are constructed of picked ashlar stone with tooled margins and deep horizontal joints. The wing walls gently curve towards the skewed abutments and are topped with square-moulded ashlar coping.

5.2.7 The underbridge has cast-iron parapet balustrades which feature a gothic arcading relief pattern. The balustrades are supported on cast-iron fascia beams with Gothic flower rivets. These cast iron elements are thought to be retained original components of the former cast iron beam bridge which was removed during the renewal of the bridge deck in c. 1893 (Insert 5-2). The 1890s deck consists of a steel girder deck consisting of two separate spans for each railway line, riveted wrought iron or steel beams, traverse joists and steel plates. The cast iron parapets and edge beams are thought to be original components of the bridge (Insert 5-2).



Insert 5-2 Royal George Underbridge deck renewal drawings, c. 1895

Insert 5-3 Royal George Underbridge (MVL3/25) south elevation.

Insert 5-4 Royal George Underbridge (MVL3/25) north elevation.

5.2.8 Royal George Underbridge (MVL3/25) maintains a visual and historic relationship with its surrounding environment, particularly to the south, which contributes to its overall setting. Despite some development and change within its wider setting, its relationship with

the Transpennine railway remains wholly legible from its wider setting. Views of the southern and northern elevations remain visible from Oaklands Road and Church Road. The physical and historical relationship of the bridge with Christ Church (grade II listed, NHLE1356701) is reflected in the gothic style of both structures. Given the nature of its visibility, Royal George Underbridge (MVL3/25) forms a notable structure in its setting and its relationship the railway and the Pennine landscape, albeit at a distance to the south, are appreciated.

Significance

5.2.9 Royal George Underbridge (MVL3/25) was designated as a grade II listed building in 2018, listed as Railway underbridge (MVL3/25), Oaklands Road (NHLE 1451848). Historic England's List Entry description identifies the bridge to be of special interest for the following reasons:

- Historic interest:
    - Constructed during the heroic age of railway building and a little-altered example of an 1840s underbridge on what is now one of the main railway lines in northern England;
    - Designed by the notable railway engineer Alfred Stanistreet Jee.
- Architectural interest:
    - As a well-designed bridge, whose craftsmanship of the stone-masonry and attention to architectural detail in its use of octagonal ashlar parapet piers with balustrades of decorative cast-iron panels of Gothic arcading and semi-octagonal piers to the angled stone abutments lifts it above the purely functional.
- Group value:
    - Architecturally inter-related with the other listed structures designed by A. S. Jee on the Huddersfield & Manchester line.

5.2.10 Royal George Underbridge (MVL3/25) is of significance as an example of a railway underbridge built during the Heroic Age of railway building (1841–50) and the period of 'railway mania' which marked a time of commercial confidence and expansion in the railways. The bridge's direct historic relationship with historic railway companies of the period, comprising the Huddersfield and Manchester Railway and LNWR, and the notable railway engineer A.S. Jee, who also designed similar structures along the route, give

the structure historical value from which it derives significance. The bridge remains in use as a part of the operational railway network and, together with surviving contemporary structures, evidences the historic infrastructure of the Huddersfield & Manchester Railway.

5.2.11 Royal George Underbridge (MVL3/25) forms part of a group of cast iron beam bridges identified along the wider Transpennine route built during the Heroic Age (1841-50) of railway building. Whilst the underbridge does not survive in its original form as a result of late 19th century deck replacement prompted by other cast iron bridge failures in the country, Royal George Underbridge (MVL3/25) was the only cast iron construction bridge along this section of the railway route and retains original cast iron elements in the parapet and fascia boards.

5.2.12 The structural elements of the original cast iron beam bridge were removed in c. 1893 and replaced with a steel girder bridge as a result of the widespread concerns over structural stability and failures identified in cast iron bridges at this time. Whilst the bridge retains elements and features which contribute towards the legibility of the historic structure, the substantial late 19th century alterations have resulted in a loss of original fabric and has diminished its historic integrity. Despite these changes, the retained cast iron parapets and fascias continue to contribute towards the aesthetic, historic and evidential value of the underbridge, and enables Jee's original design intent and the historic function of the structure to be understood, contributing to its significance.

5.2.13 Royal George Underbridge (MVL3/25) derives significance from the quality of its architecture and construction, a characteristic feature of Jee's work for the Huddersfield & Manchester Railway. This architectural quality is evident within the Gothic arcading on the cast-iron parapets and fascia beams, with the squared and rusticated stonework of the piers, abutments and wing walls complementing the decorative cast iron parapets and deck. The use of architectural elements of such high-quality craftsmanship, particularly within the prominent balustrades, elevate the overall visual expression of the underbridge to become a structure that is more than solely functional.

5.2.14 The setting of Royal George Underbridge (MVL3/25) contributes to its overall significance. The bridge's relationship with the railway remains a key component of its setting given that it continues to carry the railway through the Pennine landscape which evidences its integral relationship with the TransPennine railway. Views of the bridge from Church Road and Oakland Road, and its relationship to Christ Church (NHLE1356701) enable a greater understanding of its historic and aesthetic values. Though some developmental changes

have been affected to its setting, this does not detract from the ability to appreciate its relationship with the Transpennine route and its overall significance.

Group value

5.2.15 As identified in the list description, Royal George Underbridge (MVL3/25) is recognised to be of group value with other listed structures by A.S. Jee on the Huddersfield & Manchester Railway.[2] These comprise:

- Heyrod Hall Overbridge (MVL3/7) (grade II listed, NHLE 1449242);
- Footbridge Overbridge (MVL3/8) (grade II listed, NHLE 1452382);
- Springbank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (grade II listed, NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405);
- Wright's Mill Overbridge (MVL3/20) (grade II listed, NHLE 1452406);
- Wright's Overbridge (MVL3/23) (grade II listed, NHLE 1452409);
- Shaw Hall Bank Road Footway (MVL3/26) (grade II listed, NHLE 1451852);
- Oldham Road Overbridge (MVL3/28) (grade II listed, NHLE 1451853);
- Wickens Underbridge (MVL3/29) (grade II listed, NHLE 1451854);
- Uppermill Viaduct (MVL3/31) (grade II listed, NHLE 1068120);
- Slaithwaite Viaduct (MVL3/61) (grade II listed, NHLE 1224049);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);

[2] Wheatley's Overbridge (MVL3/103) (grade II listed NHLE 1450537) was designed by A.S. Jee for the Huddersfield & Manchester Railway. The Overbridge was granted consent for extensive change as part of the Huddersfield to Westtown (Dewsbury) Order section of the Transpennine Route Upgrade, and will be demolished and replaced with a new structure (ref 2021/91337). This is likely to result in de-listing. As such its contribution to group value has therefore been excluded from this assessment.

- Milne Viaduct (MVL3/76) (Longwood Viaduct) (grade II listed, NHLE 1220121);
- Church Street (MVL3/82) (grade II listed, NHLE 1452083);
- Huddersfield Viaduct (MVL3/92) (grade II listed, NHLE 1223531);
- Hillhouse Lane Underbridge (MVL3/94) (Willow Lane East) (grade II listed, NHLE 1432641); and
- B6118 Colne Bridge Road Overbridge (MVL3/107) (grade II, NHLE 1450265)[3].

5.2.16 Amongst the structures identified above, Royal George Underbridge (MVL3/25) is the only cast iron bridge, albeit altered. It does however, share a similar construction to a small number of surviving cast iron structures within the wider route network as part of the Leeds, Dewsbury & Manchester Railway built by Thomas Grainger between 1845 and 1847. These include the Calder and Hebble Canal Bridge (MDL1/6) (grade II listed, 1183783), River Calder Bridge (MDL1/8) (grade II listed, 1313646), Toad Holes (MDL1/12) (grade II, NHLE 1450704), Ming Hill (MDL1/14) (grade II, NHLE 1451887) and George Street (MDL1/16) (grade II, NHLE 1451888) which are more similar in design. These bridges comprise rare survivals of cast iron railway bridge construction and are recognised to be of national significance.

5.2.17 The group value which Royal George Underbridge (MVL3/25) derives from these relationships provides an understanding of the wider trends and engineering achievement which characterise the wider railway network and the Heroic Age of railway building (1825–41) more generally. This group value is enhanced by the structures ongoing use in the operational railway; as a collective group of assets, they are experienced by those following the rail line (travelling on it, or near it) as coherent features of a single historic route.

5.3 Surrounding heritage assets

5.3.1 The location of the designated and non-designated heritage assets discussed below are shown in Appendix A.

[3] B6118 Colne Bridge Road Overbridge (MVL3/107)) (grade II, NHLE 1450265) will be partially demolished and rebuilt with a supplementary structure replacing its spans over the railway. Listed building consent has been granted for this considerable intervention (ref: 2021/91330), and as a result may limit the contribution that this bridge makes towards the group value with the Jee bridges.

Designated Heritage Assets

5.3.2 There are four designated assets within a 250m buffer of Royal George Underbridge (MVL3/25). These comprise:

- Christ Church (grade II listed, NHLE1356701), located c. 90m southwest of Royal George Underbridge (MVL3/25);
- Christ Church Vicarage (grade II listed, NHLE 1309579), located c. 173m southwest of Royal George Underbridge (MVL3/25); and
- Huddersfield Narrow Canal (grade II listed, NHLE 1253529) located c. 137m south of Royal George Underbridge (MVL3/25).
- Royal George Mills Conservation Area

5.3.3 Christ Church is a mid-19th century Gothic Revival building constructed in snecked stone with a slate roof (Insert 5-5 View of Christ Church from south of Church Road). The churchyard immediately borders the listed bridge, formed by an irregularly shaped parcel of land bordered by the railway line to the north, and defined by a low stone retaining wall to the south and east. As such, the open nature of the intervening graveyard offers largely uninterrupted views of the church from the path under the bridge. Although access to the site can be gained from Oaklands Road, the primary access to the church is via Church Road, away from the bridge. Given that the church and the underbridge were established around the same times, their visible relationship and proximity maintains the historic environment which contributes to the setting of both these listed buildings.

Insert 5-5 View of Christ Church from south of Church Road

5.3.4 None of the remaining listed buildings within the study area are considered to contribute to the significance or setting of the Royal

George Underbridge (MVL3/25) as there is no direct historical relationship, shared intervisibility and/or they are located at a greater distance.

5.3.5 The Royal George Underbridge (MVL3/25) is located c. 125m north of the Royal George Mills Conservation Area. The character and appearance of the conservation area is primarily focused on the Royal George Mills and associated buildings including Royal George Cottages, and reservoir. The character of the area is industrial estate with water mills set with a rural valley landscape with views towards the Pennines. The mill was converted to residential development at the turn of the century, however much of the external fabric and historical arrangement of the mill remains legible. Most notable from the road, the area is dominated by artificial bodies of water, including the mill's reservoir, which highlight the alteration and management of natural resources to power industry. The close physical relationship of the canal, river, railway, and mills contribute to the understanding of the development of this area in the post medieval period. Royal George Underbridge (MVL3/25) is located in the wider setting of the conservation area and shares a historic relationship given that the underbridge would have provided continued access from Grasscroft to the mills following the arrival of the railway. Though visibility of the underbridge is minimal from the conservation area, it is a contributing factor to its setting and wider character and appearance and helps to provide a wider contextual understanding of the area.

Non-Designated Heritage Assets

5.3.6 The Greater Manchester Historic Environment Record (HER) notes four non-designated heritage asset within the 250m study area of Royal George Underbridge (MVL3/25). Of these, three are duplicate listed entries for Christ Church, Friezland (NHLE 212061, HER 1091.1.0), Christ Church Vicarage, Friezland (NHLE 212062, HER 1091.2.0) and Huddersfield Narrow Canal: miles SD 987 043 (NHLE 1253529, HER 12198.1.0)

5.3.7 The remaining asset is the medieval Shaw Hall Settlement (6255.1.0). Although this HER record is centred c. 144 meters north of Royal George Underbridge, the nature of the historic settlement means that its former extents are unknown. Regardless, the intervening distance, built form, vegetation and steep topography excludes the possibility for any spatial relationship between this heritage asset and the underbridge. Furthermore, it is not considered that they share any historical ties

6. PROPOSALS

6.1 Background of proposals

6.1.1 In order to achieve the TRU Programme objectives of improving journey times, capacity, overall reliability and resilience, and delivering environmental benefits, the electrification of the railway line and achievement of increased line speed is required. Works to underbridges are required to accommodate the resulting additional loading on the structures resulting from increased line speeds and increased train loading.

6.1.2 Royal George Underbridge (MVL3/25) has been assessed to be in poor condition and would not be currently capable of withstanding the increase in line speed and train loading which would impose additional strain. Without mitigation, the implementation of the Order Scheme over Royal George Underbridge (MVL3/25) risks further damage to the grade II listed underbridge.

6.1.3 As such, it has been deemed necessary, in consultation with Historic England and OMBC (see Section 4) to reconstruct the structure. The design for its reconstruction has therefore been progressed to safeguard as far as practically possible the significance of the structure.

6.2 Design development and justification

6.2.1 Design development for Royal George Underbridge (MVL3/25) has taken into consideration a number of factors including the significance of the listed structure, operational requirements and constructability. The design development process has also involved engagement with Historic England and OMBC (as detailed above in Section 4). This iterative and robust process ensured the rigorous exploration of available options, incorporating multi-disciplinary review and ongoing engagement with the heritage consultee

ES3 optioneering

6.2.2 Based on Network Rail's extensive experience delivering comparable schemes, the early phases of development of the Order Scheme had taken key constraints into consideration during the development of proposals for Royal George Underbridge (MVL3/25) at the ES3 design stage in 2021[4]. The consideration raised at this stage comprised:

[4] The delivery of railway investment programme is managed by Network Rail through the use of PACE (Project Acceleration in a Controlled Environment). This provides a flexible control framework for the delivery of rail projects. Under PACE, ES3 comprises optioneering and identification of a single design option, whilst ES4 is approval of design in principle.

- Time required working within the railway corridor is required to be minimised as much as possible to reduce risk to construction staff and the length of line possession (closure of the railway) and resulting disruption to railway service.
- The bridge crosses Oaklands Road, with the highway bending and following a relatively steep gradient. Road closure below the bridge is required to be minimised to reduce disruption to road users.
- The designation of the bridge as a grade II listed structure places a requirement on Network Rail to have special regard for its preservation under the Planning (Listed Building & Conservation Areas) Act 1990.

6.2.3 Taking these constraints into consideration, the optioneering undertaken in 2021 identified minor repairs and steelwork strengthening to Royal George Underbridge (MVL3/25) would be required. These comprised strengthening of the existing structure with the addition of steel elements to the top of the main girders, as well as upgrading the existing handrail. The proposals for these works were developed to minimise intervention into the historic structure and alteration of its appearance as far as possible, whilst mitigating the impact of increased line speeds and heavier trains.

6.2.4 The requirement for replacement of the existing metal handrails across the structure with GRP was also identified as part of the Order Scheme in order to comply with Network Rail safety standards for electrified lines. Proposals for the new handrails were developed to match the height and finish of the existing fittings, minimising the visual impact on the structure.

ES4 optioneering

6.2.5 At the commencement of the ES4 design stage in 2023, a comprehensive review was undertaken of the preferred options identified across the Route Section W2B as part of a validation exercise. This review identified a number of issues around constructability, access and disruption to the railway network in the area arising from the initial ES3 design.

6.2.6 Additional surveys of the structure of Royal George Underbridge (MVL3/25) that exposed structural elements normally hidden by ballast, were undertaken in 2024 (see paragraphs 1.3.2 and 1.3.5). These surveys identified the bridge to be in a poorer structural condition than previously understood, with degradation of critical elements such as the girder webbing and flanges. Due to this deterioration, the former preferred option of strengthening the existing structure with additional steel elements to the tops of the

main girders only would not provide the required structural capacity, would not address the newly identified issues of corroding steelwork and would therefore pose a long-term risk of future structural failure. An options review process was therefore undertaken to identify an appropriate design solution.

6.2.7 The option of retaining the structure without undertaking any works would prevent the delivery of the Order Scheme and leave the deteriorating condition of the steelwork unaddressed. This option was therefore discounted at an early stage. Taking into account the more detailed understanding of the bridge condition, three options were considered. These options comprised:

- Option 1: Steelwork Strengthening
- Option 2: Direct Fix Track
- Option 3: Deck Reconstruction

6.2.8 A summary assessment of these options is presented below in Table 6-1.

Table 6-1 – Optioneering for Royal George Underbridge (MVL3/25)

Option	Key Considerations	Advantages	Disadvantages	Indicative Image	Preferred
1) Steelwork Strengthening	• The designation of the bridge as a grade II listed structure places a requirement on Network Rail to have special regard for its preservation under the Planning (Listed Buildings & Conservation Areas) Act 1990. • Time required working within the railway corridor is required to be minimised as far as possible to reduce risk to construction staff and the length of line possession (closure of the railway) and resulting disruption to railway service. • Duration of road closures to be minimised as far as possible to reduce the level of disruption to members of the public. • Requirement to ensure sufficient structural capacity to enable increase in line speed and loading for delivery of the Order Scheme.	• This option would enable the retention of the existing deck, parapets and abutments. • The strengthening would be designed to increase the shear capacity of the existing steel girders, facilitating increases in line speed and track loading.	• There is limited clearance to fit 'top hat' steel strengthening within gauging (see overlap between gauge and strengthening proposals in indicative image). • There is limited clearance between the track sleepers and existing steel girders which would limit the feasibility of strengthening the girders. This would provide non-compliant track design due to the need for shorter sleepers • Strengthening proposals would be designed based on known condition of steel girders from surveys undertaken. It is not feasible to survey whole length of girders without causing major disruption to the railway. There is a risk that condition could be worse in areas not inspected, requiring redesign with major implications to deliverability of works. • Re-bolting would be required through existing rivet holes. The poor condition of these rivets raises buildability concerns. Heavily corroded rivets would be difficult to remove, and may result in further deterioration of the steel plate surrounding the rivets (potentially necessitating further remedial work), all of which would need to be implemented under tight time constraints in order to limit disruption to the railway and highway to agreed levels. • The design life of this option would remain uncertain, due to risk of ongoing deterioration of steel girders with particular risks where the ends of existing girders are built into abutments, restricting access to inspect and undertake remedial works if required. There would remain a potential requirement for deck reconstruction in the future due to potential for significant risks to safety.		N
2) Direct Fix Track and Steelwork Strengthening	• Requirement to address poor condition of steel girders. • Sufficient clearance needs to be maintained to enable electrification of the line and allow freight gauge clearance.	• This option would enable the retention of the existing deck, parapets and abutments. • The strengthening would be designed to increase the shear capacity of the existing steel girders, facilitating increases in line speed and track loading. • Changing the form of the trackbed would allow the ballast to be removed from around the girders, reducing the ongoing risk of corrosion. • Changing the form of the track would resolve the issue of limited clearance between sleepers and girders. • Installation could be undertaken with adjacent railway line remaining open.	• There is limited clearance to fit 'top hat' steel strengthening within gauging (see overlap between gauge and strengthening proposals in indicative image). • Strengthening proposals would be designed based on known condition of steel girders from surveys undertaken. It is not feasible to survey whole length of girders without causing major disruption to the railway. There is a risk that condition could be worse in areas not inspected, requiring redesign with major implications to deliverability of works. • Re-bolting would be required through existing rivet holes. The poor condition of these rivets raises buildability concerns. Heavily corroded rivets would be difficult to remove, and may result in further deterioration of the steel plate surrounding the rivets (potentially necessitating further remedial work), all of which would need to be implemented under tight time constraints in		N

Option	Key Considerations	Advantages	Disadvantages	Indicative Image	Preferred
			order to limit disruption to the railway and highway to agreed levels. • The design life of this option would remain uncertain, due to risk of ongoing deterioration of steel girders with particular risks where the ends of existing girders are built into abutments, restricting access to inspect and undertake remedial works if required. There would remain a potential requirement for deck reconstruction in the future due to potential for significant risks to safety. • This option would represent a major change in change in scope from the ES3 design and result in increased costs to the project. • This option would also require a major change to the track design as it would require significant run on/off slabs on the approaches to accommodate the change in track stiffness from ballasted tracks to direct fix on concrete.		
3) Reconstruction		• This option would remove the risk identified with the ongoing deteriorating condition of the existing steelwork. • By removing the corroding steel girders from the structure, certainty of the design life of the intervention can be achieved. • Reconstruction provides certainty that the investment and disruption resulting from the works would ensure a long-term solution, avoiding the risk of undertaking a short-term partial fix which may then require rebuilding in the near future. • This option provides an opportunity to increase headroom at the structure, reducing the future risk of bridge strikes. • Opportunities are available to preserve some elements of the historic structure, through the retention and reuse of the bridge abutments in conjunction with a new sensitively designed bridge deck. • This option would enable for a more robust design which would resist vehicle impact loads and prevent vehicle collisions with the set beam levels which would reduce the chance of railway disruption. • The reconstruction of the bridge would enable the design of a wider structure with safe walkway routes for maintenance and access on either side of the track.	• Reconstruction of the bridge would result in the loss of the bridge deck, pilasters and portions of the abutments. This would result in the removal of a considerable proportion of the historic bridge, altering its form and appearance, and negatively impacting the integrity and significance of the structure. • This option would represent a major in change in scope from the ES3 design and result in increased costs to the project.		**Y**

6.2.9 Option 1 (Steelwork Strengthening) and Option 2 (Direct Fix Track with Steelwork Strengthening) would both have enabled maximum retention of historic fabric. However, these options were discounted due to the ongoing risks presented by the retention of corroded steel girders within the deck. The buried elements of these girders coupled with the impracticality of having an exhaustive understanding of their condition as part of an actively used railway bridge, drastically restricts the feasibility of these options. There would be uncertainty in the long-term design life of any strengthening due to the buried elements. Similarly, should the overall condition of the girders be worse than anticipated once fully revealed during the construction phase, there is a potential risk of having to undertake a redesign with the potential for massive disruption to railway users arising.

6.2.10 The risks associated with implementing Options 1 (Steelwork Strengthening) or 2 (Direct Fix Track with Steelwork Strengthening) were assessed to be too great, liable to result in significant additional cost and disruption. Option 3 (Reconstruction) was therefore identified as the preferred option to achieve the aims of the Order Scheme. This option would bring considerable benefits in terms of certainty of design life, deliverability under tight time constraints and potentially limiting future public spending compared to the cost to strengthen (with the potential complicating factors outlined above in Table 6-1) and eventually reconstruct the bridge with retained corroding steelwork. Whilst Option 3 (Reconstruction) would result in significant alteration of the listed bridge, it was found to represent the most deliverable solution. This took into account the constrained nature of the site; the aims of the Order Scheme; minimising disruption to the railway network and enabling retention of historic fabric as far as possible.

6.3 Development of Preferred Option

6.3.1 Following the identification bridge reconstruction as the preferred option, design development was subsequently undertaken with the aim of mitigating the impact of reconstruction on the heritage significance of the structure as far as reasonably practicable.

6.3.2 Steel z-decks and reinforced concrete decks were considered and discounted. Z-decks are not considered to be sufficiently robust to withstand bridge strike impacts, which continue to present a risk due to the topography of the site. The weight of a concrete deck would limit the feasible options for installation at this site, with limited suitable area for construction operations and requirement to limit durations of highway and railway closures.

6.3.3 Steel U-decks are proposed to replace the current deck. These have been selected based on consideration of constructability constraints

and the necessary construction depth to meet the required headroom and minimise track lift. It is anticipated that this form of deck, which is widely used across the railway network, can sympathetically be introduced in this location, with additional bespoke design development for the abutments, parapets and edge beams. The reconstructed deck would need to comply with Network Rail's standards. Network Rail standard (NR/L3/CIV/020 and NR/SP/OHS/069) requires safe walkways be provided across the span. To accommodate these walkways that provide critical safety areas to operatives working on the railway, the reconstructed deck would need to be circa 1.65 m wider than the original deck. Careful consideration has been given to how this widening can be achieved in a manner most sensitive to the significance of the retained fabric.

Abutment Design

6.3.4 A key factor contributing towards the significance of the underbridge are the semi-octagonal ashlar pilasters which are a distinctive architectural feature recognised in the National Heritage List description of the bridge and during consultation with stakeholders (see Section 4). Reconstruction of the existing pilasters following the deck replacement was discounted due to the risk of instability. Therefore, given the significance of these features, an options appraisal was undertaken to determine the best approach to recreate the pilasters whilst achieving the widened deck. Four options were considered to try to limit changes to the structure's historic fabric and impacts on its architectural interest, these options are presented below in Table 6-2.

Table 6-2 - Abutment design optioneering

Option	Proposal	Advantages	Disadvantages	Indicative Image	Preferred
1) Retain existing geometry of pilasters	• Reconstructed piers continue geometry of the existing pilasters	• This option would maintain the existing appearance and plan form of the pilasters, maintaining their semi-octagonal shape and refinement of the pilasters' appearance above the string course.	• Due to the increased width of the deck, the depth of the semi-octagonal pilasters would be decreased meaning a reduction in the number of faces articulated from five to three. • This loss of articulation could dilute the prominence of the distinctive pilasters.		**Y**
Option 2 (400mm step out at base of cill unit)	• Stepping out the pilaster by 400mm in line with the base of new cill beam	• This step out would enable recreation of the piers with five faces, thereby ensuring the characterful form of these features are maintained.	• This degree of step out could result in a disjointed appearance, with the piers resembling projecting turrets. • This option may result in the structure appearing top-heavy, conflicting with original structural articulation provided by the different treatment of the masonry above and below the string course.		<u>N</u>
Option 3 (200mm step out at string course level)	• Stepping out the pier by 200mm at existing string course level, with the external face of the pilaster finishing flush with the external face of the string course	• Stepping out the piers by 200mm above the proposed reconstructed string course would enable five sides of the pilaster to be articulated.	• While five sides of the pier could be articulated, two of the sides would be much smaller than the others. Limiting the benefits of this solution and introducing practical difficulties to ensuring a high quality stone clad finish. • Losing the reveal of the string course could appear unusual, with the course losing its definition which coupled with the step out could risk the structure appearing top heavy conflicting with original structural emphasis provided by the rustication of masonry.		<u>N</u>
Option 4 (250mm step out at string course level)	• Stepping out the pier by 250mm at existing string course level, with a 50mm reveal maintained between the external face of the piers and the edge of the string course	• Stepping out the piers by 250mm above the proposed reconstructed string course would enable five sides of the pilaster to be articulated and some definition of the string course maintained.	• While five sides of the pier could be articulated, two of the sides would be much smaller than the others. Limiting the benefits of this solution and introducing practical difficulties to ensuring a high quality stone clad finish. • This option may result in the structure appearing top-heavy, conflicting with original structural emphasis provided by the rustication of masonry.		<u>N</u>

6.3.5 Option 1 (Retain existing geometry of pilasters) has been selected as the preferred option. While the distinctive geometric form of the piers would be slightly diluted as a result of the increased deck width, it is considered that stepping out the reconstructed abutments above the retained fabric would result in a top heavy and disjointed appearance. A reduction in the depth of the reconstructed pier, with a reduction from five to three articulated sides is considered preferable to the other options summarised in Table 6-2.

Parapets and Edge Beams

6.3.6 Unfortunately, due to the degree of fracturing and brittle nature of cast iron and increase in length of parapets required, reuse of the existing cast iron panels is not considered to be viable. As such, it is proposed that replacement steel panels are fabricated that recreate the gothic arcading featured on the existing cast iron parapets. While harm would arise from the loss of original historic fabric, the style of the distinctive gothic arcading would be continued in the form of the proposed new structure.

6.3.7 Precast concrete edge beams are required to provide the required trackside walkways and to enable attachment of the parapet panels. The form and appearance of the precast concrete edge beams has been carefully considered to fulfil operational requirements while ensuring they are sensitive to the character of the reconstructed bridge and sufficiently robust to resist bridge strike loads. It is proposed that steel plates with feature lines be affixed to the external elevation of the concrete beams to provide visual continuity between the beams and steel parapet above. To ameliorate the risk of tall vehicles becoming wedged beneath the bridge due to the slope of the road, it is necessary that the edge beam is deeper on the south side of the structure. This greater depth would prevent tall vehicles passing beneath the beam and then becoming stuck as the available clearance beneath the bridge reduces moving uphill. A consistency in spacing between the proposed steel feature lines would be maintained on both sides of the bridge, maintaining a sense of symmetry as far as possible and articulating the depth of the edge beam.

6.3.8 New road signage would be added to the edge beams of the reconstructed bridge. However, the number and dimension of signs would be minimised as far as is permissible according to the relevant design guidance in order to reduce their visual impact on the bridge while ensuring the safety of highway users is not compromised.

6.4 Description of proposals

6.4.1 Proposals for Royal George Underbridge (MVL3/25) would remove the existing bridge deck in order to construct a new U-type deck with new parapets and octagonal piers. The design for the new bridge has been informed by the architectural form and detailing of the existing grade II listed underbridge and has sought to respond to these (Insert 6-1).

6.4.2 Removal of the existing deck would be undertaken and the abutments cut down. The extent of this demolition would be minimised as far as possible and any fabric suitable for reuse retained. It is anticipated there could be an opportunity to reuse historic fabric from the demolished structure for works on the wider route, depending on its suitability. During demolition of the bridge, retention of historic fabric would be maximised as far as possible. Any suitable masonry reclaimed from the removal of bridges along the Route Section W2B would be used for cladding.

6.4.3 The reconstruction of the underbridge would consist of two new painted U-type decks supported on rocker bearings and reinforced concrete bearing plinths. To accommodate the new deck, the partial reconstruction of the abutments is required. To minimise line possession time, reconstruction of each abutment is proposed to be undertaken using three pre-cast concrete units as detailed below.

6.4.4 The new deck would be supported on pre-cast concrete cill units, doweled into the existing cut down masonry abutments. The cill units would be clad with stone on their external faces with only the bearing plinths left visible as exposed concrete. Stone-clad concrete pilaster units would be installed to the ends of the cill units, incorporating semi-octagonal piers which would continue the geometry of the existing piers. To facilitate the wider deck, the depth of the semi-octagonal piers would be reduced above the feature course, achieving three faces compared with the existing five faces present on the current structure. These units would match the existing architectural hierarchy of the piers, with finer masonry employed above the feature course. A stone cap would be placed atop the pilasters.

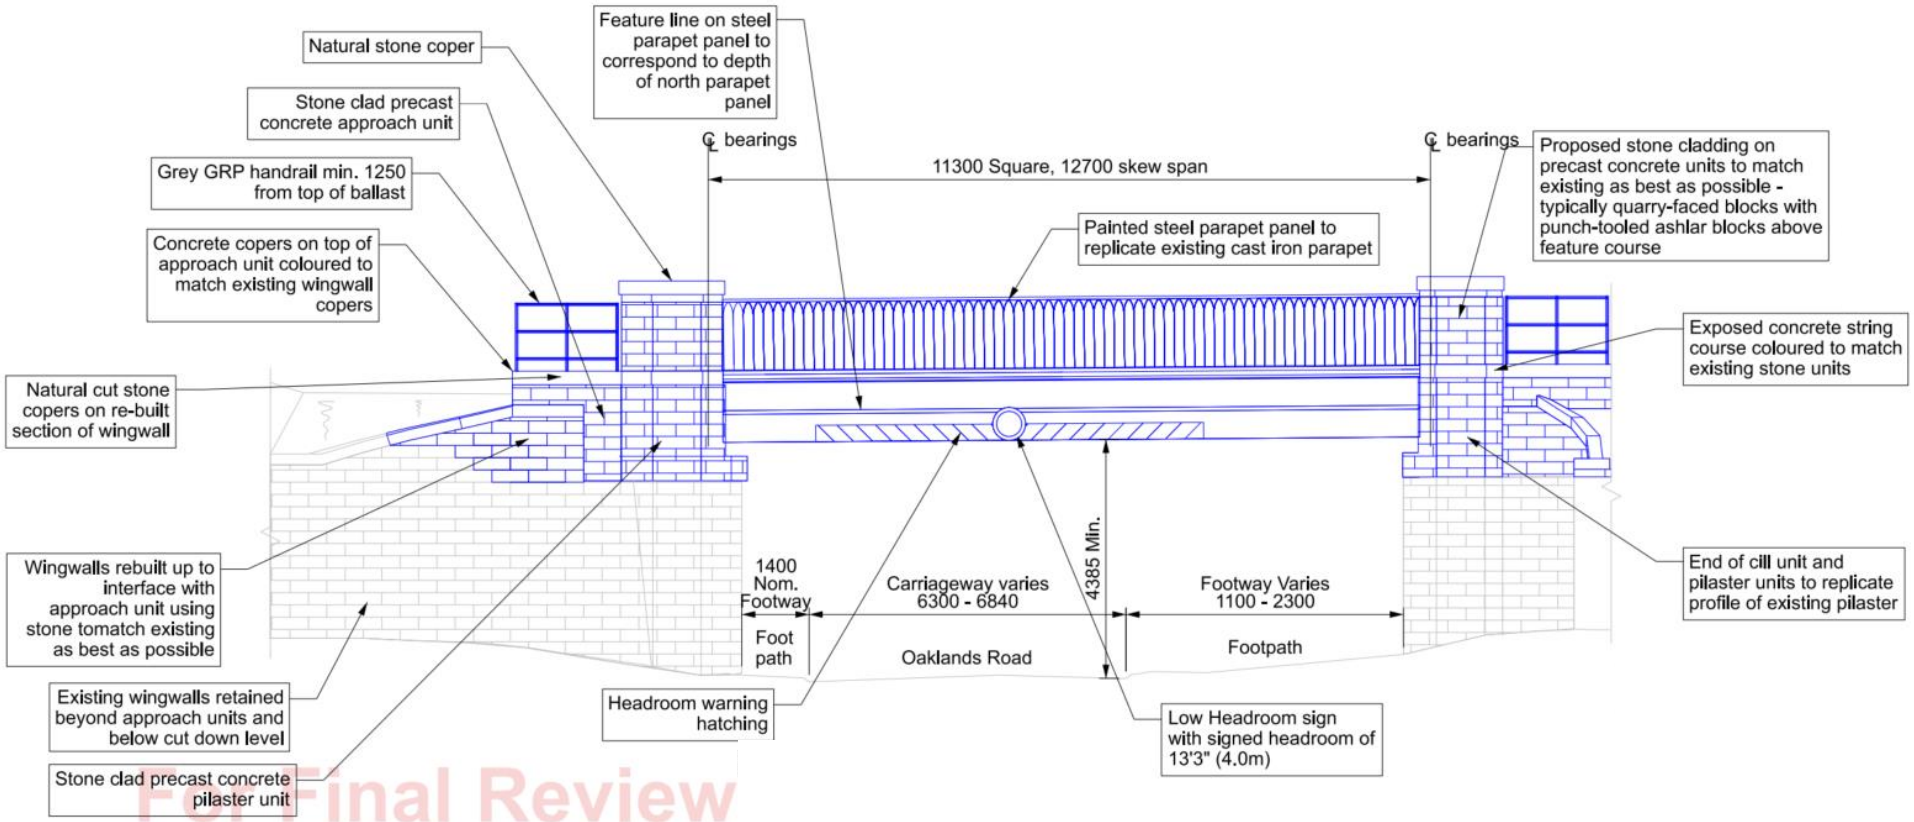
6.4.5 To the rear of the pilaster units, reinforced concrete L units would be installed at track level to retain the ballast on the approaches due to the widened bridge, with grey GRP tubular guardrails on top. All pre-cast concrete units would be clad in natural cut stone to replicate the existing materiality of the bridge, matching the difference in rustication above and below the feature course. Coloured concrete would be used on top of the approach units and feature course, colour matched to the existing wing wall copers.

6.4.6 The pre-cast concrete units would be clad in stone, to match existing fabric as closely as possible, both in stone type and colour, and in finishing. Where the wing wall would be rebuilt, this would be undertaken using stone which matches the existing, employing stone reclaimed from bridge reconstructions along the route as far as reasonably practicable, and would be finished with natural cut stone copers.

6.4.7 As described above, the new U-type decks would incorporate walkways to either side to enable safe access across the structure. The walkways would run atop a painted steel cable trough with GRP grate walkway. These would be supported on the concrete edge beams doweled into the cill units. The parapets of the new deck would be formed by steel panels with gothic arcade detailing, recreating the architectural detailing of the existing parapets, and a top rail.

6.4.8 The edge beams would be of differing depths between the north and south elevations, due to the need to provide consistent headroom on to either side of the structure on the sloping Oaklands Road. The north would be 0.625m in depth, whilst that to the south would be 1.14m in depth, with a banded detail set 0.625m from the top of the beam, in line with the soffit of the north edge beam, below which the headroom warning hatching and signage would be located.

The new structure would be waterproofed with a tightly bonded system in line with Network Rail standards. A drainage system would be installed with black cast iron down pipes which would feed into the highway drainage system.



Insert 6-1 Proposed south elevation of Royal George Underbridge (MVL3/25)

Construction Methodology

6.4.9 The proposed works for the reconstruction of Royal George Underbridge (MVL3/25) comprise:

- Removal of the existing track and ballast over the bridge in advance of demolition.
- Careful demolition of the existing bridge deck.
- Demolish pilasters and parapets and cut down abutments for sand cement bed.
- Reclamation of historic masonry as far as possible with transportation and secure storage at the site construction compound. Stone will be subject to preliminary rapid assessment for potential reuse and then palletised ready for transportation back to site where it will be redressed and used as appropriate.
- New precast cill beams installed using a crane or self-propelled modular transporter (SPMT). Dowels between the cill beam and abutments installed.
- New bridge deck, pilaster units and approach units installed by crane or SPMT.
- Rear abutment drainage installed and the structure waterproofed.
- Backfill the rear of abutments and reinstate the ballast and track.
- The wingwalls re-built and cladding installed to pilasters, approach units and cill units.

6.4.10 The proposed works to Royal George Underbridge (MVL3/25) are shown in the following drawing which accompany this application:

- Existing and Proposed Plan: 167037-TGP-25-MVL3-DRG-T-LP-162500
- Existing and Proposed Elevations and Sections: 167037-TGP-25-MVL3-DRG-T-LP-162501
- Existing and Proposed Elevation and Section: 167037-TGP-25-MVL3-DRG-T-LP-162503
- Existing and proposed Elevation and Sections: 167037-TGP-25-MVL3-DRG-T-LP-162504

7. IMPACT OF PROPOSALS

7.1 Royal George (MVL3/25)

7.1.1 The proposed works to the grade II listed Royal George Underbridge (MVL3/25) are required in order to achieve the objectives of the wider TRU Programme and deliver the public benefits of the Order Scheme.

7.1.2 Following recent condition surveys which identified that the late 19th century steel girders and cast iron elements of the underbridge were in poor condition, it was determined that reconstruction is required. Whilst this would result in the loss of the much of the structure, with the extent of retained fabric confined to the abutments and wingwalls, it would maintain the presence of an underbridge in this location and legibility of the historic railway line.

7.1.3 The reconstruction of Royal George Underbridge (MVL3/25) would erode its historic and aesthetic value through the reconstruction of the deck and part of the abutments. The proposals would result in the loss of the existing painted arched steel plate between the cross beams and rivetted steel beams of the deck, which form visually interesting features evidencing the bridge's construction. The proposed painted steel U-decks would be legible as a modern intervention when passing under the bridge. A portion of the abutments would be retained, which would maintain to a limited extent the structure's architectural interest which derives principally from being the only cast iron beam bridge, albeit altered, along this section of the historic Huddersfield & Manchester Railway.

7.1.4 The proposals would result in the substantial removal of a historic bridge that forms part of the infrastructure associated with the Heroic Age (1841-50) of railway construction. That being said, Royal George Underbridge (MVL3/25) has already been subject to significant alterations in c. 1893 with the replacement of the cast iron beam deck with a steel girder bridge, although retained the cast iron parapets and fascia beams. As such, though the reconstruction of Royal George Underbridge (MVL3/25) would be considered a loss in its own right and detrimental to the historic character and group value that this structure contributes to as part of the Transpennine route, historic alterations of the structure have already degraded its significance to an extent.

7.1.5 These proposals would result in substantial harm to the significance of Royal George Underbridge (MVL3/25) as defined by NPPF and have embedded details to mitigate against this harm wherever possible. The proposals have sought to sensitively respond to the historic form and design of the bridge through incorporation of

measures such as gothic arcading to the new bridge parapets, reinstatement of the semi-octagonal piers and feature course, and use of stone cladding. These measures would aid the integration of new and existing fabric, and maintain the architectural character of the bridge, albeit in altered form. Whilst the level of harm from these works would be substantial, the careful consideration given to ensure the overall composition, architectural features and relationship with the retained elements of the bridge would, to a small degree, offset the potential harm to Royal George Underbridge (MVL3/25).

7.1.6 The proposed reconstruction of Royal George Underbridge (MVL3/25) would impact the group value shared with other listed structures designed by A.S. Jee for the Huddersfield & Manchester Railway. The loss of Royal George Underbridge (MVL3/25) would remove one element of this group of 18 designated bridges (see paragraph 5.2.15) The proposed reconstruction would also have an impact on the underbridge's group value with other cast iron bridges identified on the wider Transpennine route (see paragraph 5.2.16). In both cases, the bridge derives a degree of significance from their shared group value and would therefore be slightly diminished as a result of the reconstruction of this bridge. The impact would amount to less than substantial harm to the retained structures arising from a weakening of the extent of which group value contributes towards their significance.

7.2 Other heritage assets

7.2.1 The proposals would have no direct physical impact on the designated and non-designated assets identified in the 250m study area.

7.2.2 The reconstruction of the bridge would result in an, albeit minor, change to the setting of Christ Church (grade II, NHLE 1356701). As mentioned in paragraph 5.3.3, these grade II listed structures contribute to each other setting given that they are contemporaneous and maintain uninterrupted views due to the open nature of the graveyard and the prominence of the church. Whilst the reconstruction of Royal George Underbridge (MVL3/25) would result in a minor change to the setting of the church, the considered design for the reconstruction of the underbridge which would reinstate the gothic elements and the overall form of the bridge, would maintain their visual relationship.

7.2.3 Whilst the underbridge makes a contribution to the setting of Royal George Conservation Area, its reconstruction would not have an appreciable impact on its significance given that the underbridge would continue to provide access towards Royal George and legibility of the historic environment.

7.3 Mitigation

7.3.1 Design proposals were developed through an iterative process which has robustly sought to avoid or reduce the impact on the significance of Royal George Underbridge (MVL3/25). Additional information with respect to these elements of design development is included in Section 6.2.

7.3.2 Regular consultation with historic environment stakeholders and the design team were held through the design development process for the reconstruction of the bridge (see Section 4). Historic environment stakeholders, including Historic England and OMBC have been involved in the development of the design mitigation described below.

7.3.3 The design development process has resulted in mitigation being embedded within the design of the reconstruction of Royal George Underbridge (MVL3/25). The following design considerations have been taken into account in response to the magnitude of proposed alterations:

- The use of natural stone cladding to minimise the areas of visible concrete, reflecting the materiality of both the original bridge and many of the other retained structures along the Transpennine route. This approach would ensure natural stone remains the dominant material of the bridge abutments.
    - Salvaged stone from reconstructed structures along the route will also be considered for reuse on the wing walls where feasible.
- Reinstatement of the semi-octagonal piers within the abutments and the feature course across these to maintain the historic form of the underbridge and its architectural features as far as possible.
- Recreation of the cast iron gothic arcading pattern on the bridge parapets.

7.3.4 During construction of the works, toolbox talks would be delivered to disseminate best practice for reducing potential impacts in relation to construction activity associated with Royal George Underbridge (MVL3/25), for example to ensure the approach taken to maximising masonry for reclamation is communicated.

Recommended Compensation

7.3.5 In addition to these embedded measures, additional mitigation secured through the use of listed building consent conditions is recommended comprising:

- A scheme of historic building recording to Level 3 standards in accordance with Historic England guidance (Historic England 2016). This would provide a permanent record of Royal George Underbridge (MVL3/20) in its current form and be lodged with the Greater Manchester Historic Environment Record. This building recording would help to compensate for the harm to significance resulting from the reconstruction by providing the opportunity to document the structure which would be largely lost as a result of the proposed works. The historic building recording would include:
    - Drawings;
    - Photography; and
    - Written account.
- A scheme of permanent heritage interpretation would be developed and installed adjacent to Greenfield Station. This would provide the opportunity to engage members of the public with the heritage of the Huddersfield & Manchester Railway including the historic structures designed by A. S. Jee such as Royal George Underbridge (MVL3/25). Further engagement with stakeholders with respect to the content of the interpretation would be undertaken during the detailed design phase.

7.4 Public benefit

7.4.1 The reconstruction of Royal George Underbridge (MVL3/25) and resulting substantial harm is considered justified to ensure the realisation of the substantial public benefits of the Order Scheme, in accordance with paragraph 214 of the NPPF.

7.4.2 As part of the wider TRU Programme, the Order Scheme would directly and indirectly play a role in improving regional connectivity and enhancing of some of Britain's busiest rail network, in turn realising economic, social and environmental objectives of the programme. The Transpennine route is identified as a key transport corridor, providing connections between cities in the North of England. The improvements in connectivity delivered by the TRU programme will support aspirations for economic growth and "levelling up" opportunities across the North of England.

7.4.3 The key objectives of the TRU programme are to achieve the part electrification of the Transpennine Route, improve journey times and capacity between key destinations, improve overall reliability and resilience of the route, and provide environmental benefits from modal shift from road to rail freight reducing the number of heavy vehicles on the highway network and associated air pollution. The reconstruction of Royal George Underbridge (MVL3/25) would directly facilitate the achievement of these aims by enhancing the structural capacity and condition of the bridge to enable the use of larger gauge and faster trains, delivering increases in line speed, capacity and resilience.

7.4.4 Electrification would deliver faster journey times and improved performance by allowing trains to accelerate faster, and brake more efficiently. The Order Scheme will deliver faster line speeds (80 mph throughout), improving journey times along the Transpennine Route, aiming to provide an improved journey time from Leeds – Manchester Victoria of 42-44 minutes and York to Manchester Victoria of 65-67 minutes. Works to the track and structures along the Route, including reconstruction of Royal George Underbridge (MVL3/25), are required to accommodate this increase, and without these changes the Scheme would be unable to go ahead.

7.4.5 As a vital constituent part of the Order Scheme, the proposed reconstruction would also facilitate indirect benefits associated with the wider programme of works, including station upgrades, track renewal and signalling improvements.

7.4.6 The reliability and resilience of the route and services operating on it will be improved by replacement of existing infrastructure with electrification equipment, new track drainage and signalling. Modern signalling equipment will reduce the headway between trains, allowing them to run closer together which will in turn provide increased capacity. The Scheme will provide the capability to operate four ‘express’, two ‘semi-express’ services and up to two local services an hour on the Route and will provide increased flexibility to timetable more train paths.

7.4.7 Electrification of the Scheme would provide substantial environmental and sustainability benefits and is an investment in ‘greener’ energy technology. This supports Network Rail’s Decarbonisation Strategy and is bolstering national targets for reducing harmful emissions that cause climate change, which are set out in Government legislation for achieving net zero carbon by 2050.

7.4.8 The Order Scheme will also deliver improved safety through measures including replacement of two level crossings, installation

of additional safety measures on existing bridges; enhancements to the local highway networks and new pedestrian crossing points at locations including Greenfield and Mossley Stations. Accessibility of the railway network will also be improved with the provision of fully accessible stations at Greenfield Station and the relocated Mossley Station. These measures are being brought forward as part of the wider TRU Scheme to electrify and modernise the Route, as facilitated, in part, by the reconstruction of Royal George Underbridge (MVL3/25).

7.4.9 Significant residual beneficial effects arising from the operation of the wider TRU Scheme have been previously identified in the Huddersfield-Westtown TWA Order Inquiry from December 2021. These included recognition of improved journey times, reliability, and capacity at the Local Authority area and in turn the sub-regional and regional level. These improvements will bring direct significant benefits to local businesses and the labour market through improved access to the local regions along the section of the route from Stalybridge to Diggle.

7.4.10 To this effect, the proposals at Royal George Underbridge (MVL3/25) are therefore essential in achieving the overall substantial public benefits of Route Section W2B and wider objectives of the Order Scheme, and without these interventions, the Order Scheme would not be able to be safely and successfully implemented. Alongside these substantial public benefits, the delivery of heritage interpretation adjacent to Greenfield Station would enable public engagement with the heritage of the Huddersfield & Manchester Railway, its architecture and significance.

8. CONCLUSION

8.1.1 The significance of Royal George Underbridge (MVL3/25) lies primarily in its historic and architectural interest. The underbridge derives significance from being the only cast iron beam bridge, albeit altered in c. 1893, on this section of the Huddersfield & Manchester Railway dating to the Heroic Age (1841–50) of railway history. The high quality of the bridge's architecture, including the extant cast iron gothic arcaded parapets, cast iron fascia beams and semi-octagonal piers together with its high-quality workmanship present a unique structure on the Huddersfield & Manchester Railway. The bridge also derives significance from its direct historical relationship with the notable railway engineer A.S. Jee and the Huddersfield & Manchester Railway and LNWR. It also possesses group value as one of a number of A.S. Jee structures on the Transpennine route, as well as with cast iron structures identified elsewhere along the wider Transpennine route. The setting of Royal George Underbridge (MVL3/25) contributes to the significance of the structure.

8.1.2 Initial proposals for Royal George Underbridge (MVL3/25) were for strengthening and repair of the existing structure, however following a condition survey which identified that the structure was in poor condition, reconstruction was identified to be required. Historic England and OMBC have accepted that the reconstruction of the structure is necessary to deliver the TRU.

8.1.3 The proposals for reconstruction were developed through a robust process of design optioneering undertaken collaboratively with historic environment stakeholders and informed by the desire to maximise heritage benefits and limit harm. Special regard has been given to the desirability of preserving or enhancing the structure or its setting or any features of special architectural or historic interest which it possesses. Every effort was made to retain this historic structure as part of the TRU. However, this was unachievable within the operational parameters set. Whilst historic fabric, particularly the cast iron elements, could not be retained, every effort to maintain the architectural character of the structure was made during the design development. Several mitigation measures have been integrated into the design to reduce the impact on the significance of Royal George Underbridge (MVL3/25) and preserve its architectural character as far as possible.

8.1.4 With the reconstruction of Royal George Underbridge (MVL3/25), the Order Scheme can achieve key improvement objectives as outlined in Section 7.4. It would also support the achievement of substantial public benefits related to:

- Improved efficiency and reliability of the railway (in journey time saving and increased capacity);
- Reduction of delays to trains and other highway users (improved efficiency of the railways means fewer heavy vehicles on the highway network causing traffic issues and contributing to air pollution);
- Supporting sustainable transport development in line with Network Rail's Decarbonisation Strategy; and
- Improving public health and safety in providing safe routes across the railway.

8.1.5 In addition to this, the delivery of a programme of heritage interpretation at Greenfield Station would provide the opportunity for engagement of the public with the heritage of the Huddersfield & Manchester Railway.

8.1.6 The reconstruction of the grade II listed Royal George Underbridge (MVL3/25) would result in substantial harm to its significance and should be considered exceptional. This will mean the loss of an

irreplaceable piece of railway infrastructure, dating to the Heroic Age (1841-50) of railway building. It is also a loss to the collection of A.S. Jee bridges that are located along this section of the Transpennine route, as well historic cast iron bridges along the Transpennine route.

8.1.7 Whilst the reconstruction of Royal George Underbridge (MVL3/25) is regrettable, its loss would be outweighed by the substantial public benefits that accrue from enabling the Transpennine programme to be achieved. The proposals therefore meet the requirements of paragraph 214 of the NPPF in relation to the justification for substantial harm and provide sufficient justification to outweigh the strong presumption against demolition of listed buildings outlined in policy 24 of the OMBC local development framework and Policy JP-P2 of Places for Everyone.

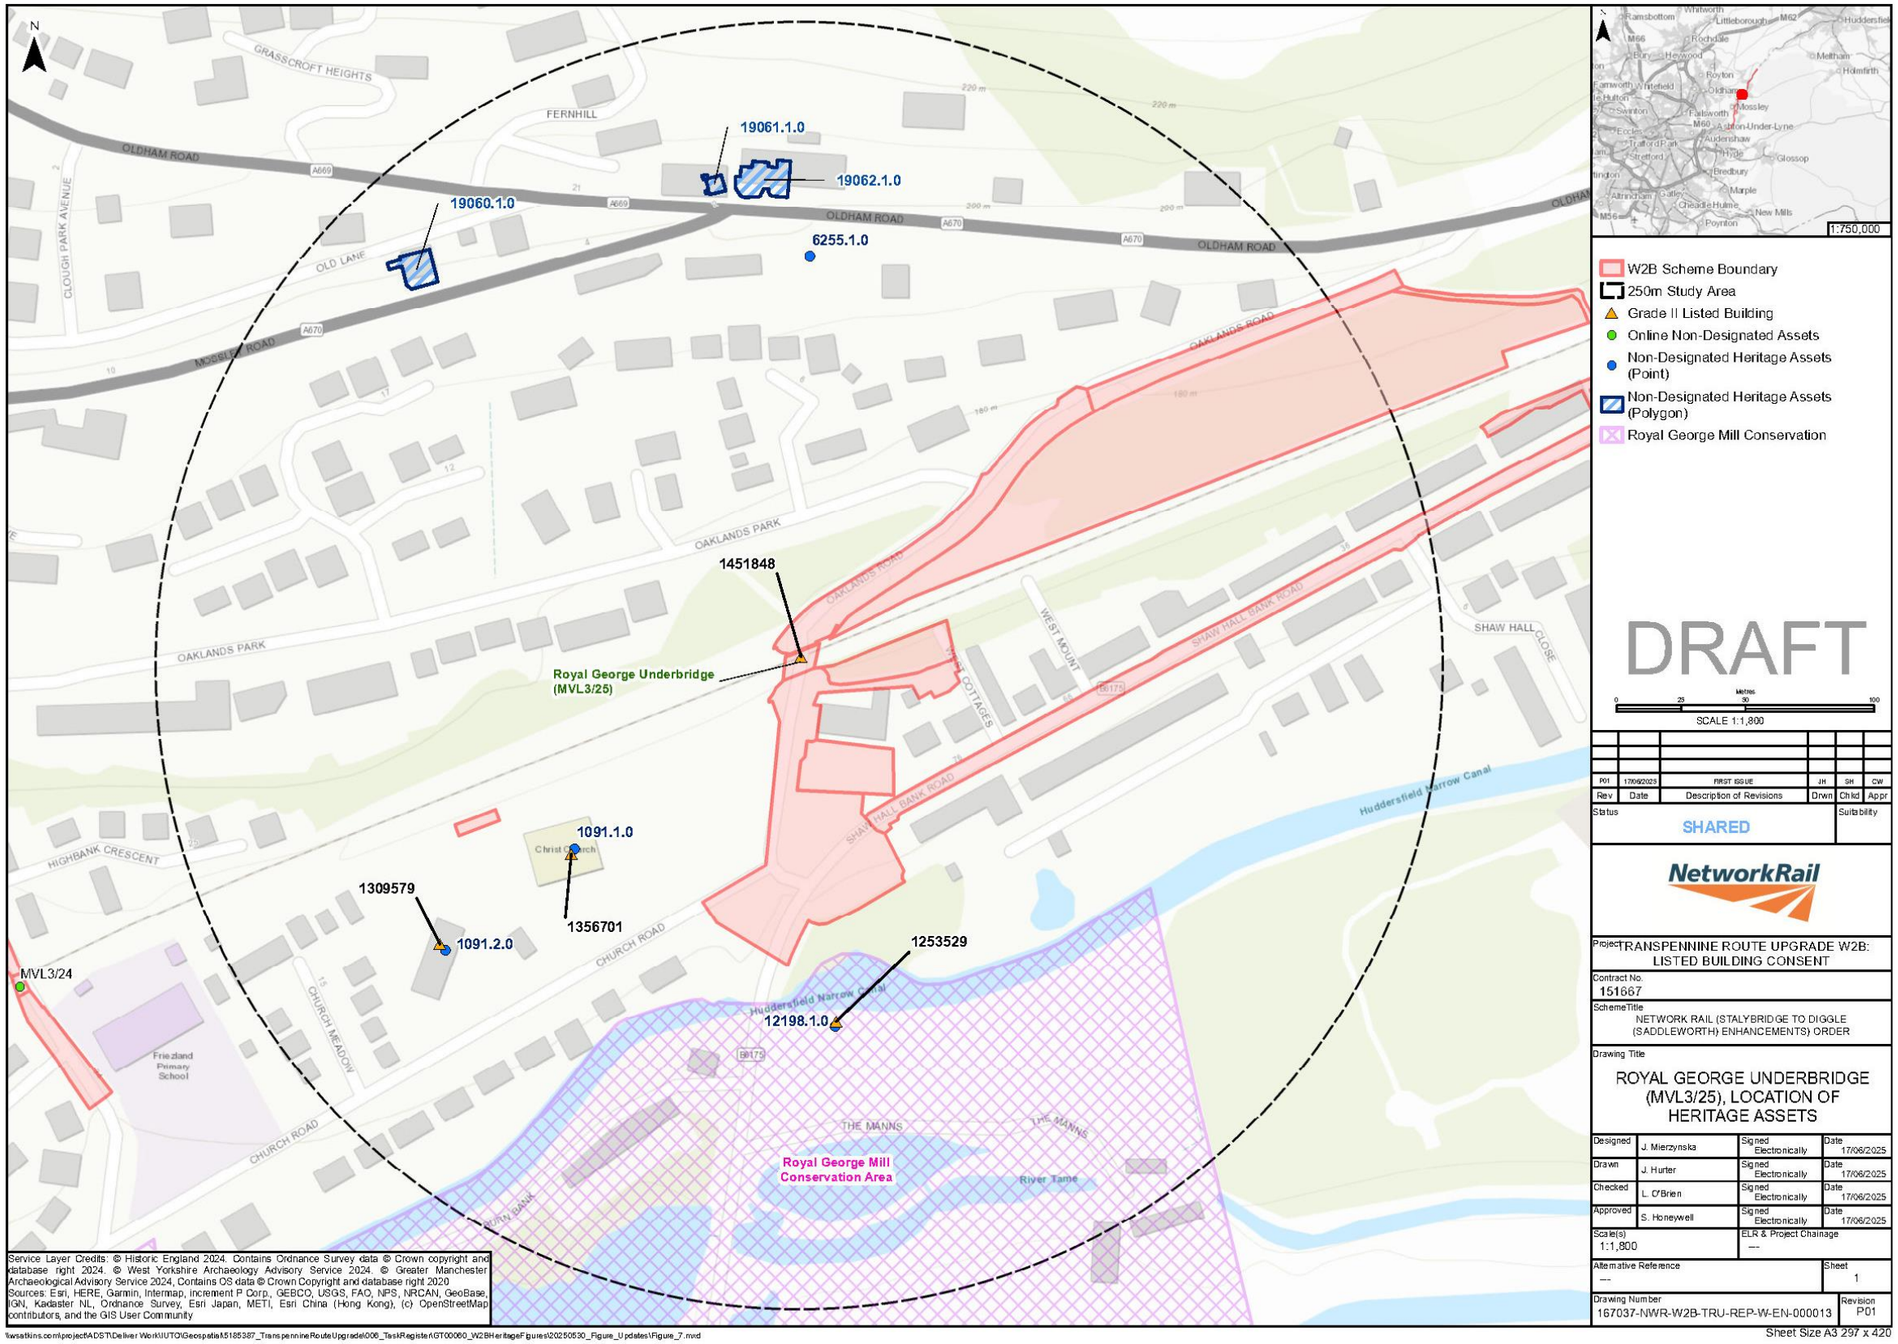
APPENDIX A – LOCATION PLAN



APPENDIX B – HISTORY ENGLAND LIST DESCRIPTION

Official list entry

Heritage Category:	Listed Building
Grade:	II
List Entry Number:	1451848
Date first listed:	23-Mar-2018
List Entry Name:	Railway underbridge MVL3/25, Oaklands Road
Location Description:	Oaklands Road, Grasscroft.

Location

The building or site itself may lie within the boundary of more than one authority.

District:	Oldham (Metropolitan Authority)
Parish:	Saddleworth
National Grid Reference:	SD9859804392

Summary

Railway underbridge for the Huddersfield & Manchester Railway. Mid-late 1840s by A S Jee.

Reasons for Designation

The underbridge MVL3/25, Oaklands Road, Grasscroft, constructed in the mid-late 1840s by A S Jee for the Huddersfield & Manchester Railway, is listed at Grade II for the following principal reasons:

Historic Interest:

- constructed during the heroic age of railway building and a little altered example of an 1840s underbridge on what is now one of the main railway lines in northern England

- designed by the notable railway engineer Alfred Stanistreet Jee.

Architectural Interest:

- as well-designed bridge, whose craftsmanship of the stone-masonry and attention to architectural detail in its use of octagonal ashlar parapet piers with balustrades of

decorative cast-iron panels of Gothic arcading and semi-octagonal piers to the angled stone abutments lifts it above the purely functional.

Group value:

- architecturally inter-related with the other listed structures designed by A S Jee on the Huddersfield & Manchester line.

History

In contrast to the main trunk lines of the late 1830s that were constructed by single railway companies, the route from Stalybridge to Leeds had fragmented origins and was the work of three different railway companies: the Huddersfield & Manchester Railway, Leeds, Dewsbury & Manchester Railway, and the Manchester & Leeds Railway.

The Huddersfield & Manchester Railway was authorised in 1845 and followed the route of the Huddersfield Narrow Canal for much of its length, including a railway tunnel through the Pennine hills set alongside the earlier Standedge Canal Company tunnel of 1811; in 1846 the railway company also acquired the canal. Joseph Locke and Alfred Stanistreet Jee were appointed to survey and design the new line, the two engineers having already worked together on a major project linking Manchester and Sheffield. Jee became the lead engineer for the Huddersfield line, which passed through challenging terrain, assisted by resident engineers that included his brother Moreland Jee (until 1848) and Herbert F Mackworth. Construction of the line was divided into various contracts, with many contractors being only responsible for a single cutting, viaduct or tunnel portal. The largest contract for the Standedge Tunnel between Diggle and Marsden was let to a single contractor, Thomas Nicholson in 1847. The tunnel's completion in 1849 marked the opening of the line.

The Leeds end of the route, which was also authorised in 1845, was constructed by the Leeds, Dewsbury & Manchester Railway. The engineer was Thomas Grainger who had previously largely worked in Scotland, and the line was completed in 1849.

A short three-mile section of the route between Heaton Lodge Junction and Thornhill Junction near Mirfield was developed by the Manchester & Leeds Railway and was constructed between 1837 and 1840, with George Stephenson as the chief engineer. The structures on this line were designed by Thomas Gooch under the oversight of Stephenson. In 1847 the railway company changed its name to the Lancashire & Yorkshire Railway.

In 1847 the Huddersfield & Manchester Railway and the Leeds, Dewsbury & Manchester Railway were acquired by the London & North Western Railway (LNWR) so that the company could access the city of Leeds and the textile towns of West Yorkshire. This pitted them as rivals to the Lancashire & Yorkshire Railway, although at points on the route the two companies had to work together. By 1851 the London & North Western Railway had an overall mileage of railway track of 800 miles and it became the most prominent railway company in the country and the largest joint-stock concern in the world in the late C19.

Although the LNWR had a general manager, Captain Mark Huish, the lines of the Stalybridge to Leeds route still managed their own affairs. LNWR later carried out expansion works, including the widening of tracks and bridges, the construction of additional tunnels, and station alterations. In 1923 the line became part of the London Midland & Scottish Railway, and subsequently part of the nationalised British Railways in 1948. The line, its structures and track are currently (2018) owned by Network Rail, and the passenger services operated by TransPennine Express and Northern Rail.

This underbridge carries the railway over Oaklands Road. It was designed by A S Jee and dates to the construction of the Huddersfield & Manchester Railway between 1845 and 1849 (it is depicted and named on the first edition 1:10,560 OS map surveyed between 1848 and 1850 and published in 1854).

Details

Railway underbridge for the Huddersfield & Manchester Railway. Mid-late 1840s by A S Jee.

MATERIALS: cast and wrought iron, rusticated and ashlar sandstone (shale grit/Kinderscout grit/millstone grit) with ashlar dressings.

DESCRIPTION: the bridge is located on the east side of the rural village of Grasscroft. It is a skew, girder bridge carrying the two-track railway line over a bend in the road below. The angled abutments have semi-octagonal piers and are constructed of squared, rusticated stone blocks with chamfered edges to emphasize the joints. The piers rise to track level where there is an ashlar band, above which there are slightly narrower octagonal parapet piers. The parapet piers are constructed of picked ashlar blocks with tooled margins and deep horizontal joints. The abutment stonework courses through to gently curving and angled wing walls with square-moulded ashlar coping. The wing walls terminate in octagonal piers.

The bridge has cast-iron panels forming the parapet balustrades with a relief pattern of closely-spaced Gothic arcading. The balustrades are supported on deep cast-iron fascia beams with small, relief flower rivets. The bridge deck has two separate spans with riveted wrought-iron or steel beams carrying transverse joists and riveted iron plate jack arches.

29 November 2024

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the meetings on 6 and 21 November 2024 to review the proposals for bridges MVL3/9, 10, 23, 25, 26, 28, 29 and 31. As before, it was helpful to see the drawings in advance and then talk through the proposals with the team.

The impacts of the proposed changes and our comments are detailed below:

Proposals at *Manchester Road underbridge MVL3/10*, *Shaw Hall Bank Road underbridge MVL3/26* and *Wickens underbridge MVL3/29* will involve minor works, consisting of renewal of railings and strengthening of parapets with reinforced concrete. Visually, there will be only a minor impact, as the replacement railings are similar to the existing and the concrete strengthening will be hidden from view by the parapets. There will be a very low level of less than substantial harm to the physical fabric of the bridges due to the new railings being grouted into cored holes in the masonry parapet blocks. We do not have concerns over the works at these three bridges and recognise the efforts to maintain the visual appearance on the bridges.

The proposals for *Spring Bank Lane overbridge MVL3/9* and *Uppermill Viaduct MVL3/31* have been discussed at previous meetings, and it was helpful to see further details of the works at these structures. There will be a low level of less than substantial harm to *Spring Bank Lane overbridge* due to the introduction of raised copers, however the use of colour-matched concrete here will help to mitigate some of the harm caused by the visual impact of the new copers. Works to *Uppermill Viaduct* will likewise lead to a low level of less than substantial harm due to the introduction of brackets to support the OLE portals which will have an impact both physically and visually. We appreciate that care has been taken in the spacing of these portals so the rhythm of the bridge arches is not unduly interrupted, and so that the pattress plates are not affected.

More considerable impacts will result from proposals at *Wright's overbridge MVL3/23*, *Oaklands Road underbridge MVL3/25* and *Oldham Road overbridge (Greenfield*

Historic England

Station) MVL3/28, all of which will result in substantial harm to the significance of the designated assets.

As mentioned in previous letters, the removal of *Wright's Overbridge* will cause substantial harm to its significance through the total loss of its historic form and all original fabric, and through the re-routing of a historic public footpath. Thorough justification will need to be presented in the supporting documentation to provide the reasoning for the total loss of this bridge.

The proposed reconstruction of *Oldham Road Overbridge* has also been discussed previously. This is a skew overbridge located on the north-east side of Greenfield Station which carries Oldham Road over the track below. The bridge currently has a masonry arch which will be dismantled, along with much of the approaching wing walls, resulting in very little historic fabric being retained. The works will also necessitate the removal of the ornate historic iron railway footbridge. There will be substantial harm to the significance of the listed asset due to the severity of changes to its physical appearance and the loss of historic fabric. We recognise that some fabric will be retained for reuse as cladding material, however this will need to be carefully managed to maintain the look of the structure. The stone coursing in the existing bridge runs through the parapets into the wing walls. We would like to see care taken to replicate this effect within the reconstructed bridge to avoid a disjointed appearance to the new structure, which could arise from using mismatched stone-cladded panels. The existing bridge features flat masonry pilasters that project slightly from the bridge to either side of the arch. These have not been articulated in the proposed design and we would like to see further investigation into whether they could be incorporated into the design. This location would be suitable for display of permanent interpretation materials which could help to mitigate some of the harm by informing the public about the history of the route and the upgrade works.

Oaklands Road underbridge MVL3/25 is a skew girder bridge carrying the two-track railway line over a bend in the road below. The angled abutments have distinctive semi-octagonal piers, and the parapets are ornate balustrades of decorative cast-iron panels of Gothic arcading. The craftsmanship of the stonemasonry and attention to architectural detail lifts the design of this bridge above the purely functional and it has considerable architectural interest. There will be substantial harm to the significance of this listed bridge resulting from the proposals to reconstruct and widen the bridge deck and to rebuild the octagonal piers. In order to minimise the harm, the design of the rebuilt piers and abutments will need to be careful managed to ensure there is meaningful articulation of the distinctive shape of the piers. This includes the contrasting shape and dimensions of the piers where they extend through and above the parapet. We are comfortable with the proposals to replicate the decorative cast-iron panels to minimise the visual impact of the loss of the original fabric here.

Historic England

Sarah Coward
AtkinsRéalis

Direct Dial: +447990339949

Our ref: PA01200823
18 July 2025

Dear Sarah

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the recent meetings to review the draft Heritage Statements that will be submitted for Listed Building Consent applications for changes to bridges on the proposed Transpennine Route Upgrade line.

The Heritage Statements are well considered and it is clear that alternative options to reconstruction have been investigated in each case, which are helpfully set out in tables in the reports. The proposals will result in substantial harm to listed bridges along the route, however clear justification for this has been set out in the Heritage Statements.

We very much welcome the inclusion of heritage interpretation at Greenfield Station. This is a significant early rail route and there is notable educational potential in the material that has been generated from the research into the railway structures as part of this project.

Regarding Oaklands Road underbridge MVL3/25, we are comfortable with the design of the proposals for the reconstruction of the parapet and stone turrets. These have been carefully considered to minimise the visual impact.

Next Steps

We appreciate having been involved at pre-application stage in this important project, and value being able to feed into design plans. If you require further pre-application advice please get in touch.

Yours sincerely

1. INTRODUCTION

1.1 Transpennine Route Upgrade

1.1.1 The Transpennine Route Upgrade (TRU) is a major, multi-billion pound program of improvements to increase capacity, improve journey time and reliability performance of rail services on the Transpennine Route.

1.1.2 The TRU will aim to deliver:

- An improved journey time for Leeds – Manchester Victoria of 42-44mins;
- An improved journey time for York to Manchester Victoria of 65-67mins;
- Capability to operate four ‘express’ and two ‘semi-express’ services an hour;
- Capability to operate up to two ‘local services’ an hour on the route;(subject to future operating timetables);
- Performance of the Transpennine Route to be 92.5% or higher each period;
- Larger freight containerisation capability (W12 gauge);
- Freight paths/rights to be retained as existing; and
- A contribution to Network Rail’s Decarbonisation Strategy and climate policy.

1.1.3 The Network Rail (Stalybridge to Diggle (Saddleworth) Enhancements) Order extends from Stalybridge Tunnel, in the west, through to the western portal of Standedge Tunnel (the “Order Scheme”). This section of the Transpennine Route follows the Tame Valley from Stalybridge to Diggle, and is referred to hereafter as Route Section W2B.

1.1.4 The TRU programme in Route Section W2B involves a variety of works including the electrification of the railway (installation of overhead line equipment (OLE) and associated infrastructure), reconstruction and modification of existing bridges to facilitate electrification of the railway, construction of a new station at Mossley, closure of Stockport Road Level Crossing and Moorgate Halt Level Crossing, railway works at Greenfield Station to support the upgrade and electrification of the railway track reconfiguration works and track lowering works through Stalybridge and Scout Tunnels. Under the Planning (Listed Buildings and Conservation Areas) Act 1990, consent is required from the local planning authority for any proposed works that would affect the character of a listed building.

The Transport and Works Act 1992 introduced section 12(3A) into the Planning (Listed Buildings and Conservation Areas) Act 1990, the effect of which is to "call-in" for determination by the Secretary of State applications to the local planning authority for listed building consent where such consent is required in consequence of proposals included in an application for a Transport and Works Act Order (TWAO). The procedures in the Transport and Works Applications (Listed Buildings, Conservation Areas and Ancient Monuments Procedure) Regulations 1992 then apply to the call in of such listed building consent applications.

1.1.5 This Heritage Statement has been compiled in support of an application for listed building consent by Network Rail in respect of the proposed works on the grade II listed Shaw Hall Bank Road Footway (MVL3/26) (NHLE 1451852). This bridge is located in Grasscroft (NGR SD9894204527), Oldham. A location plan is provided in Appendix A.

1.1.6 The Historic England list description (included in full in Appendix B) names the listed building as “Railway Accommodation Underbridge (MVL3/26), Footway”. Throughout this Heritage Statement the structure is referred to as “Shaw Hall Bank Road Footway (MVL3/26)” in accordance with Network Rail’s naming of the structure.

1.1.7 The preparation of this assessment has been informed by the Statement of History and Significance: West of Leeds (Alan Baxter Associates, 2024) and the Route-wide Statement of Significance (Alan Baxter Associates, 2019).

1.2 Scope

1.2.1 The requirement for assessment and its scope is guided by policy contained within the National Planning Policy Framework (NPPF, revised 2025) specifically paragraph 207, which seeks an assessment proportionate to the asset’s importance and sufficient to understand the potential impacts of development. The specific scope of this assessment is determined by Network Rail’s requirement to provide an objective assessment of the heritage value of assets that may be affected by the Order Scheme, and to appraise the nature and extent of any impact upon setting and significance.

1.2.2 This Heritage Statement will:

- Identify and discuss the heritage significance of the listed structure, including the contribution of setting;
- Present the design requirements of the Order Scheme at the structure;

- Present the process of development and optioneering which has led to the design proposal for the Order Scheme in relation to the structure;
- Identify the impacts of the design proposal on the significance of the structure, in the context of current national and local planning policy and guidance;
- Discuss any mitigation recommended in relation to the structure; and
- Consider the public benefits to be gained from the Order Scheme weighed against the impact on the significance of the structure, in line with the National Planning Policy Framework, 2025 and the Oldham Local Development Framework, 2011.

1.3 Current Conditions

1.3.1 Shaw Hall Bank Road Footway (MVL3/26) was built to the design of Alfred Stanistreet (A.S.) Jee between 1845-1849 and is contemporary with the Huddersfield & Manchester Railway. The underbridge allows passage of a footpath linking Shaw Hall Bank Road and Oaklands Road under the railway embankment, providing a pedestrian route between Grasscroft and Greenfield.

1.3.2 Shaw Hall Bank Road Footway (MVL3/26) was subject to a detailed examination as part of Network Rail's regular maintenance programme in December 2016. The assessment concluded that the underbridge was in fair condition and identified the following defects to the structure:

- Open joints across the arch and wing walls;
- Fractures in the arch voussoirs;
- Water running off the weep pipes above the stone abutments, springers and on both sides of the arch**;**
- Diagonal step fractures found on the upside low mileage wingwall**;**
- Open joints throughout all three wing walls; and
- Deterioration of pointing in several areas.

1.3.3 Regular visual assessments have been undertaken since 2016, the most recent of which was undertaken in 2021. These surveys have identified little change to the bridge's condition, with the exception of vegetation growth on the wing walls.

Insert 1-1 Shaw Hall Bank Road Footway (MVL3/26) south elevation.

Insert 1-2 Shaw Hall Bank Road Footway (MVL3/26), soffit and masonry walling.

Insert 1-3 Shaw Hall Bank Road Footway (MVL3/26), soffit and masonry walling.

1.3.4 Regular visual assessments have been undertaken since 2016, the most recent of which was undertaken in 2021. These surveys have identified little change to the bridge's condition, with the exception of vegetation growth on the wing walls.

1.4 Summary of proposal

1.4.1 In order to achieve the TRU Programme objectives, electrification of the Route is required. This would require the alteration of a number of existing underbridges, including Shaw Hall Bank Road Footway (MVL3/26) to accommodate OLE, higher line speed and increased freight trains. It has been determined to be necessary to strengthen the underbridge using precast reinforced units. These works will therefore enable the implementation of the Order Scheme.

2. LEGISLATION AND POLICY CONTEXT

2.1 Legislation

2.1.1 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) (the "Act") governs the designation and works to listed buildings in England.

2.1.2 The Act states in s.1 (5):

'In this Act "listed building" means a building which is for the time being included in a list compiled or approved by the Secretary of State under this section; and for the purposes of this Act—

any object or structure fixed to the building;

any object or structure within the curtilage of the building which, although not fixed to the building, forms part of the land and has done so since before 1st July 1948, shall be treated as part of the building.'

2.1.3 Under the Act, no one is permitted to undertake or cause to be undertaken any works that would affect the character of a listed building unless the works are authorised. Section 16 of the Act identifies that whether such works can be carried out is determined by the local planning authority or the Secretary of State:

'(1) Subject to the previous provisions of this Part, the local planning authority or, as the case may be, the Secretary of State may grant or refuse an application for listed building consent and, if they grant consent, may grant it subject to conditions.

(2) In considering whether to grant listed building consent for any works the local planning authority or the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses.

(3) Any listed building consent shall (except in so far as it otherwise provides) ensure for the benefit of the building and of all persons for the time being interested in it.'

2.1.4 In relation to the granting of listed building consent, Section 17 of the Act stipulates that conditions attached to listed building consent may include those with respect to:

a) *' the preservation of particular features of the building, either as part of it or after severance from it;*

b) *the making good, after the works are completed, of any damage caused to the building by the works; [and]*

c) *the reconstruction of the building or any part of it following the execution of any works, with the use of original materials so far as practicable and with such alterations of the interior of the building as may be specified in the conditions'.*

2.1.5 It is also defined in s.17 (2) that a condition *'may also be imposed requiring specified details of the works (whether or not set out in the application) to be approved subsequently by the local planning authority or, in the case of consent granted by the Secretary of State, specifying whether such details are to be approved by the local planning authority or by him'.*

2.1.6 The Act also states in s.66 (1):

'In considering whether to grant planning permission or permission in principle for development which affects a listed building or its setting, the local planning authority or, as the case may be, the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses'.

2.2 National Policy

2.2.1 The National Planning Policy Framework (NPPF, 2025) sets out the Government's planning policies for England and how these should be applied to contribute to the achievement of sustainable development, supported by the Planning Practice Guidance on the Historic Environment (updated July 2019) (MHCLG, 2019).

2.2.2 Section 2 of the NPPF outlines the principles of achieving sustainable development including, in Paragraph 8, an environmental objective '*to protect and enhance our natural, built and historic environment*'. Paragraph 9 sets out that these objectives should be delivered through the preparation and implementation of plans and the application of the policies within the NPPF. Section 16 of the NPPF deals specifically with the historic environment. Where changes are proposed, the NPPF sets out a clear framework to ensure that heritage assets are conserved, and where appropriate enhanced, in a manner that is consistent with their significance.

2.2.3 This Heritage Statement aims to address relevant policy within the NPPF in relation to Section 16 'Conserving and enhancing the historic environment' and includes guidance on assessment of significance of the heritage assets and their setting that may be affected by the proposed works and how to consider potential impacts on significance.

2.2.4 The following paragraphs as set out in the NPPF include key provisions considered of particular importance to this application:

- Paragraph 207 – '*In determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand the potential impact of the proposal on their significance*.'
- Paragraph 212 – '*When considering the impact of a proposed development on the significance of a designated heritage asset, great weight should be given to the asset's conservation (and the more important the asset, the greater the weight should be). This is irrespective of whether any potential harm amounts to*

substantial harm, total loss, or less than substantial harm to its significance.'

- Paragraph 213 – '*Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification. Substantial harm to or loss of:*

  a) *grade II listed buildings, or grade II registered parks or gardens, should be exceptional;*

  b) *assets of the highest significance, notably scheduled monuments, protected wreck sites, registered battlefields, grade I and II* listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional.'*

- Paragraph 214 – '*Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss, or all of the following apply:*

  a) the nature of the heritage asset prevents all reasonable uses of the site; and

  b) no viable use of the heritage asset itself can be found in the medium term through appropriate marketing that will enable its conservation; and

  c) conservation by grant-funding or some form of not for profit, charitable or public ownership is demonstrably not possible; and

  d) *the harm or loss is outweighed by the benefit of bringing the site back into use.'*

- Paragraph 215 – '*Where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate, securing its optimum viable use*.'

- Paragraph 216 – '*The effect of an application on the significance of a non-designated heritage asset should be taken into account in determining the application. In weighing applications that directly or indirectly affect non-designated heritage assets, a*

balanced judgment will be required having regard to the scale of any harm or loss and the significance of the heritage asset.'

- Paragraph 219 - '*Local planning authorities should look for opportunities for new development within Conservation Areas and World Heritage Sites, and within the setting of heritage assets, to enhance or better reveal their significance. Proposals that preserve those elements of the setting that make a positive contribution to the asset (or which better reveal its significance) should be treated favourably.*'

Planning Practice Guidance: Historic Environment

2.2.5 The Planning Practice Guidance (PPG) (MHCLG, 2019) provides further advice and guidance that expands the policy outlined in the NPPF. It expands on terms such as 'significance' and its importance in decision making. The PPG clarifies that being able to properly assess the nature, extent and the importance of the significance of the heritage asset and the contribution of its setting, is very important to understanding the potential impact and acceptability of development proposals (paragraph 008 Reference ID: 18a-008-20190723).

2.2.6 The PPG states that in relation to setting, a thorough assessment of the impact on setting needs to take in to account, and be proportionate to, the significance of the heritage asset under consideration and the degree to which proposed changes enhance or detract from that significance and the ability to appreciate it (paragraph 009 Reference ID: 18a-009-20190723).

2.2.7 The extent and importance of setting is often expressed by reference to visual considerations. Although views of or from an asset will play an important part, the way in which an asset is experienced in its setting is also influenced by other environmental factors such as noise, dust and vibration from other land uses in the vicinity, and by our understanding of the historic relationship between places.

2.2.8 Paragraph 013 of the PPG recognises that the contribution that setting makes to the significance of the heritage asset does not depend on there being public right or the ability to experience that setting. When assessing any application for development which may affect the setting of a heritage asset, local planning authorities may also need to consider the implications of cumulative change (Paragraph: 013 Reference ID: 18a-013-20190723 Revision date: 23 07 2019).

2.2.9 In relation to substantial harm, the PPG states that *'it is the degree of harm to the asset's significance rather than the scale of the development that is to be assessed'* (paragraph 017). Harm to

heritage assets can be avoided or minimised if proposals are based on a clear understanding of the heritage asset and its setting (paragraph 008 Reference ID: 18a-008-20190723). The NPPF indicates that the degree of harm should be considered alongside any public benefits that can be delivered by development.

2.3 Local planning policy

Oldham Joint Core Strategy and Development Management Policies.

2.3.1 Local planning policy for Oldham Metropolitan Borough Council (OMBC) is provided by the Joint Core Strategy and Development Management Policies of the Oldham Local Development Framework (Oldham Council, 2011), adopted in November 2011, and a small number of retained policies from the Unitary Development Plan (Oldham Council, 2009).

2.3.2 Policy 24 relates to the Historic Environment and is reproduced in full below:

Policy 24 Historic Environment

'Oldham has a rich historic environment with many significant and valuable features, structures and characteristics. The council will protect, conserve and enhance these heritage assets and their settings which adds to the borough's sense of place and identity.

Development proposals must have regard to:

National and local guidance and policies on the historic environment.

Oldham Rochdale Housing Market Renewal Pathfinder Heritage Assessments.

Greater Manchester and Oldham Urban Historic Landscape Characterisation Study.

Conservation Area Appraisals and Management Plans, where appropriate.

When allocating sites and determining applications for planning and advertisement consents, the council will seek to protect, conserve and enhance the architectural features, structures, settings, historic character and significance of the borough's heritage assets and designations including:

a. Listed buildings.

b. Conservation areas.

c. *Registered parks and gardens (their historic character and setting).*

d. *Scheduled ancient monuments (their archaeological value and interest).*

e. *Significant archaeological remains.*

f. *Locally significant buildings, structures, areas or landscapes of architectural or historic interest (including non-designated locally significant assets identified in the local lists compiled by the council).*

The council will support heritage-led regeneration, including the reuse of historic buildings such as mills, to achieve economic, community and regeneration objectives, where appropriate.

Listed Buildings

Development to, or within the curtilage or vicinity of, a listed building or structure must serve to preserve or enhance its special interest and its setting. There will be a strong presumption against proposals involving the demolition of listed buildings or structures. Proposals which would lead to the loss or cause harm to grade I and II listed buildings should be wholly exceptional. Development proposals for a building incorporating a historic shop front should make provision for its retention, restoration and repair.*

Conservation Areas

Development within or affecting the setting of a conservation area, including views in or out, must serve to preserve or enhance the character or appearance of the area. Proposals for all new development, including alterations and extensions to buildings and their re-use, must have a sensitive and appropriate response to context and good attention to detail. Proposals must not adversely affect important architectural or historic features or distinctive local features or structures unless it can be demonstrated that the development brings substantial benefits to the community. Proposals for the demolition of a building in a conservation area must demonstrate that it is unrealistic for the building to continue in its existing use and a suitable alternative use cannot be found, or the building is in poor structural condition and the cost of repairing and maintaining it would be disproportionate to its importance and value and the demolition would preserve or enhance the character or appearance of the conservation area. In exceptional circumstances, the fact that a demolition would bring substantial benefits to the local community may outweigh the balance in favour of the preservation of the building.

Registered Parks and Gardens

Development which would lead to the loss of, or cause harm to, the historic character or setting of any part of registered park and garden will not be permitted.

Scheduled Monuments

Development which would lead to the loss of, or cause harm to, scheduled ancient monuments should be wholly exceptional.

Local Designations

Development which would affect the following designations will only be permitted in cases where it can be demonstrated that the benefits of the development brings substantial benefits to the community which outweigh the preservation of the heritage asset:

Significant archaeological remains.

Locally significant buildings, structures, areas or landscapes of architectural or historic interest'.

Places for Everyone

2.3.3 Places for Everyone (Greater Manchester Combined Authority 2024) is a joint development plan covering nine Greater Manchester districts including Oldham, setting out a framework for sustainable development. Policy JP-P2 concerns Heritage and is of relevance to this assessment:

Policy JP-P2: Heritage

We will proactively manage and work with partners to positively conserve, sustain and enhance our historic environment and heritage assets and their settings. Opportunities will be pursued to aid the promotion, enjoyment, understanding and interpretation of heritage assets, as a means of maximising wider public benefits and reinforcing Greater Manchester's distinct character, identity and sense of place.

Local Plans will set out the key elements which contribute to the district's identity, character and distinctiveness and which should be the priority for conserving and enhancing in the future and demonstrate a clear understanding of the historic environment and the heritage values of sites, buildings or areas and their relationship with their surroundings. This knowledge should be used to inform the positive management and integration of our heritage by:

1. *Setting out a clear vision that recognises and embeds the role of heritage in place-making;*

2. *Ensuring that the heritage significance of a site or area is considered in accordance with national planning policy in the planning and design process and opportunities for interpretation and local engagement are optimised;*

3. *Integrating the conservation and enhancement of heritage assets and their settings, with creative contextual architectural responses that contribute to their significance and sense of place;*

4. *Delivering positive benefits that sustain and enhance the historic environment, as well as contributing to the economic viability, accessibility and environmental quality of a place, and to social wellbeing; and*

5. *Exploring opportunities to reduce greenhouse gas emissions that restoration of historic buildings offer.*

Particular consideration will be given to ensure that the significance of key elements of the historic environment which contribute to Greater Manchester's distinctive identity and sense of place are protected from harm. These include historic town centres, places of worship, historic transport routes including the canal network, industrial buildings and structures including textile mills, farmsteads and other sites, buildings, and areas of identified archaeological, architectural, artistic and/or historic value. Development proposals affecting designated and non-designated heritage assets and/or their settings will be considered having regard to national planning policy. Where heritage assets have been identified as being at risk, Local Plans should identify specific opportunities for them to contribute to regeneration and place-making, and they should set out strategies for their repair and re-use. Development proposals which will help safeguard the significance of and secure a sustainable future for Greater Manchester's heritage at risk will be supported in principle, provided they are not contrary to national policy or other policies in the development plan. Proposals should be informed, as necessary, by the findings and recommendations of the appropriate heritage assessment(s) in the development plan evidence base and/or any updated heritage assessment submitted as part of the planning application process.

Historic England Guidance

2.3.4 Historic England has published a series of Good Practice Advice (GPA) notes and Advice Notes (AN) of which those of most

relevance to this appraisal are GPA2 – Managing Significance in Decision-taking (Historic England, 2015), GPA3 – The Setting of Heritage Assets (Historic England, 2017), and AN12, Statements of Heritage Significance (Historic England, 2019).

2.3.5 GPA2 – Managing Significance in Decision-taking emphasises the importance of having a knowledge and understanding of the significance of heritage assets likely to be affected by the development and that the *'first step for all applicants is to understand the significance of any affected heritage asset and, if relevant the contribution of its setting to its significance'* (paragraph 4). Early knowledge of this information is also useful to a local planning authority in pre-application engagement with an applicant and ultimately in decision making (paragraph 7).

2.3.6 GPA3 – The Setting of Heritage Assets provides advice on the setting of heritage assets. Setting is as defined in the NPPF and comprises the surroundings in which a heritage asset is experienced. Elements of a setting can make positive or negative contributions to the significance of an asset and affect the ways in which it is experienced. Historic England state that setting does not have a boundary and what comprises an asset's setting may change as the asset and its surrounding evolve. Setting can be extensive and particularly in urban areas or extensive landscapes can overlap with other assets. The contribution of setting to the significance of an asset is often expressed by reference to views and the GPA in paragraph 11 identifies those views, such as those that were designed or those that were intended, that contribute to understanding the significance of assets.

2.3.7 AN12, Statements of Heritage Significance outlines a recommended approach to assessing the significance of heritage assets in line with the requirements of NPPF. It includes a suggested reporting structure for a 'Statement of Heritage Significance', as well as guidance on creating a statement that is proportionate to the asset's significance and the potential degree of impact of a proposed development. The AN also offers an interpretation of the various forms of heritage interest that an asset can possess, based on the terms provided in the NPPF Glossary (Annex 2); namely archaeological, architectural, artistic, and historic.

3. ASSESSMENT METHODOLOGY

3.1 Research

3.1.1 In accordance with Historic England guidance and as determined by policy requirements, this assessment identifies the baseline heritage interest of Shaw Hall Bank Road Footway (MVL3/26). The historical narrative informing the baseline has been derived from a review of various resources including maps and other cartographic and photographic sources. Statutory information in relation to the designated assets has been obtained from the National Heritage List for England maintained by Historic England and the Historic Environment Record maintained by Greater Manchester Archaeology Advisory Service.

3.1.2 Additional information concerning the assets, their condition, use and setting has been obtained from a walkover survey undertaken by suitably qualified and experienced heritage specialists on 21 and 22 of May 2024, including observation from surrounding vantage points and informed by appraisal and observation derived from close working with other disciplines within the project team.

3.2 Significance and setting

3.2.1 Assessment of the significance of heritage assets and their setting has been undertaken in consideration of guidance issued by Historic England. Significance is often established by statutory designations such as listed buildings, scheduled monuments and conservation areas. More particular advice as to what makes up significance is set out in AN12, which establishes a method for thinking consistently about the heritage values that can be ascribed to a place. When making an assessment of significance, numerous aspects are considered including architectural interest, historic interest, group value, social value, former uses and local distinctiveness. These aspects are grouped into four values defined in the NPPF as historical interest, archaeological interest, artistic interest, and architectural interest.

3.2.2 In assessing whether the setting of an asset contributes to its significance, and in assessing the effect of development, Historic England GPA3 provides a checklist of attributes that may affect setting and significance under five broad categories comprising:

- The location and siting of the development;
- The form and appearance of the development;
- Additional effects (change to skyline etc.);
- Permanence; and

- Consequential effects.

4. CONSULTATION

4.1.1 Historic England and OMBC have been involved in ongoing stakeholder consultation with Network Rail through the development of Route Section W2B of TRU.

4.1.2 Regular meetings with both Historic England and OMBC have been held to discuss the design development of the proposals in relation to Shaw Hall Bank Road Footway (MVL3/26). Initial meetings were held periodically through 2021 and resumed in 2024 to discuss the overall route and design development for all structures along Route Section W2B.

4.1.3 The design development for Shaw Hall Bank Road Footway (MVL3/26) was presented and discussed with the historic environment stakeholders on the following dates.

Table 4-1 Consultations for Shaw Hall Bank Road Footway (MVL3/26)

Date	Stakeholder in attendance	Key agreements/items discussed
15 February 2021	• OMBC	• Project briefing on the bridge structures in order to identify the location and the Order Scheme output, Network Rail electrification challenge, structures overview and next steps. • Structures presentation included MVL3/26 and identified the need to upgrade the handrails with a non-conductive material. Given that this would result in a change to the structure which is not like-for-like, this was identified to require listed building consent.
26 May 2021	• Historic England • OMBC • TMBC	• Overview of the structures along Route Section W2B which are of historic interest, including the grade II overbridges and underbridges which are noted for their heritage significance, particularly as essential railway structures. The group value of the bridges was identified as a key contributor to significance. • Presentation of the purpose of Heritage Statements and their assessment of impact with the emerging GRIP 3 designs • Early-stage recommendations to minimise harm to significance against the requirements for justification of proposals and opportunities to pursue sensitive design and

Date	Stakeholder in attendance	Key agreements/items discussed
		compensation. • Reassurance was provided to the councils that they will be involved in the GRIP 3 design process which will be used within the detailed design development of GRIP 4 (Single Option Development). Clarification was also provided on the sustainable heritage initiatives. • Historic England stated that they expect to get an understanding of significance at this stage and that they anticipate options to be shared for comment. Also stressed the importance of minimising harm.
6 February 2024	• Historic England	• Overview of listed structure, and details of the challenges of the electrification of the route in relation to listed overbridges were presented. • The design approach for electrification across / under existing railway bridges was noted to have been agreed in principle by Network Rail and following consultation with the Local Authorities & Historic England at the preceding design stage.
22 April 2024	• OMBC	• Overview of preferred options for structures along the route within Oldham. This included the preferred option for Shaw Hall Bank Road Footway (MVL3/26) which consists of installation of GRP handrails.
	• Historic England	• Presentation of development of next steps for the underbridges, including Shaw Hall Bank Road Footway (MVL3/26). • All of the underbridges are of masonry arch construction (apart from MVL3/25) and would be progressed once the track designs are received.
6 November 2024	• Historic England	• Draft listed building consent drawings presented for discussion for the underbridges. • Presentation of interventions required to strengthen Shaw Hall Bank Road Footway (MVL3/26). Acknowledgement that there will be minimal change to the bridge's appearance. • Confirmation that this will not entail raising the parapet, and

Date	Stakeholder in attendance	Key agreements/items discussed
		no additional OLE equipment will be required.
29 November 2024	• Historic England	• In their formal pre-application advice letter, Historic England confirmed that proposals for Shaw Hall Bank Road Footway (MVL3/26) would result in *'a very low level of less than substantial harm'* (Appendix C.1).
2 April 2025	• OMBC	• Presentation of overview of the aims and objectives of TRU, with emphasis on the historic context of Route Section W2B and the 12 listed building consents applications which are being prepared for the various works to the grade II listed bridges and viaduct along the route section. • Network Rail requested for the draft Heritage Statement to be reviewed by the Council for comment and feedback. • Presentation of overview of electrification challenges caused by the existing arch profile of a number of existing bridges and have developed bespoke solutions for these to achieve the required clearance.
4 April 2025	• Historic England	• Overview of draft comments from Historic England. Request to draw out the heritage interpretation in the reports as part of the heritage benefits. • Historic England were content with the assessment of significance for all structures, and noted that the optioneering tables were helpful. Historic England requestion for further details on the heritage interpretation as part of the heritage benefits.
12 May 2025	• OMBC	• Proposals for Shaw Hall Bank Road Footway (MVL3/26) presented to OMBC heritage officers, noting less than substantial harm to the structures.
24 June 2025	• OMBC	• Pre-application advice letter received from OMBC outlining local planning authority advice following review of the draft listed building consent application. • OMBC found that the proposals at Shaw Hall Bank Road Footway (MVL3/26) would result in a low level of less than substantial harm arising from minor physical intervention. • OMBC highlight that clear and convincing justification will be required for any harm arising to designated heritage

Date	Stakeholder in attendance	Key agreements/items discussed
		assets, with substantial benefits required to outweigh substantial harm. • A high level of harm was also found to the group value of the bridges designed by A.S Jee on the TransPennine Route, due to the proposed demolition of Wright's Overbridge (MVL3/23) and reconstruction of four other bridges, and a limited level of harm to group value arising from the alteration of three other structures (including Shaw Hall Bank Footway (MVL3/26)).
	• Historic England	• Pre-application advice letter received from Historic England providing overarching feedback on proposals affecting listed bridges between Stalybridge and Standedge Tunnel (see Appendix C). • Acknowledgment given to the collaborative approach taken at pre-application stage, to fully explore alternative options to reconstruction and for the opportunity for Historic England to feed into design plans. • The heritage statements adjudged to be well considered with clear justification having been provided for the substantial harm identified to those structures proposed for removal or reconstruction. • The inclusion of interpretation at Greenfield Station is very much welcomed by Historic England.

5. HERITAGE ASSETS AND THEIR SIGNIFICANCE

5.1 History of the W2B Transpennine Route

5.1.1 The railway connecting Stalybridge to Huddersfield, which runs under Shaw Hall Bank Road Footway (MVL3/26) was constructed by the Huddersfield & Manchester Railway Company between 1846 and 1849. The mid-1840s was a period of commercial confidence and massive expansion in the railway network across England, known as 'Railway Mania' which has been described by Historic England as the Heroic Age (1841-1850) of railway building (Historic England, 2017). Between 1845 and 1852 the railway network expanded from 2,345 miles to 7,272 miles (3774km to 11,703km) (Alan Baxter Associates, 2019). Constructed at the height of this boom, the Stalybridge to Leeds line was a product of this trend. Traversing a challenging landscape through the Pennines, the line was planned to follow the route of the Huddersfield Narrow Canal for much of its length, with the canal acquired by the Railway Company the year after the railway's authorisation (Alan Baxter Associates, 2019). These difficult landscape conditions resulted in the need to build several major viaducts and tunnels. These included Standedge Tunnel through the Pennines, which was constructed alongside the 1811 canal tunnel and is *'indisputably significant as a major engineering achievement'* (Alan Baxter Associates, 2024).

5.1.2 The development and expansion of the railways during the 19th century transformed the landscape and settlements through which they passed, fuelling industrial growth and settlement expansion. The impact of improved communications, first with the arrival of the canal in 1811, and then the railway in 1849, provided valuable links with Huddersfield, Manchester and Leeds, enabling import of raw materials and export of manufactured goods. This fuelled the gradual industrialisation and settlement expansion along the Tame Valley. This can be seen on historic Ordnance Survey maps dating from the 19th and early 20th century where industrial development including mills, dyeworks, printworks and quarries, is shown to have been present along the route of the railway and extending into the more upland areas around Saddleworth and Harrop Dale, whilst settlements such as Mossley and Dobcross gradually expanded.

5.1.3 Shaw Hall Bank Road Footway (MVL3/26) was constructed for the Huddersfield & Manchester Railway Company in the mid to late 1840s. The principal engineer for the Huddersfield & Manchester Railway was Alfred Stanistreet (A. S.) Jee (1816–1858), who was assisted by the more renowned engineer Joseph Locke (1805–1860). Jee's work on the Huddersfield & Manchester Railway represents, arguably, his greatest achievement. This can be seen particularly in the construction of the Standedge Tunnel, which at

over three miles long was one of the longest and most difficult in England, but also through the various large-scale viaducts along the route. In the 1850s, he worked internationally on the Spanish line from Alar-del-Rey to Reynosa where his skill in design, his accuracy and his completeness of the details earned him high praise. He died in a fatal accident upon the opening of the second portion of that line.

5.1.4 In 1847, prior to the opening of the line, the Huddersfield & Manchester Railway Company was taken over by the London and North Western Railway (LNWR). As part of the LNWR network, the Huddersfield & Manchester Railway formed part of a direct route from Manchester to the West Riding, enabling the LNWR to access the textile and coal industries of West Yorkshire. By 1851, the LNWR was the most prominent railway company of the period, with over 800 miles of track and was the largest joint-stock concern of its time, capitalised at £29 million. The line was acquired by the London Midland and Scottish Railway in 1923, before being nationalised in 1948.

5.1.5 Whilst other parts of the Transpennine route were subject to significant alterations, the Huddersfield & Manchester Railway between Standedge Tunnel and Stalybridge was subject to relatively limited alteration. The Micklehurst Loop was constructed from 1881-85 to provide additional capacity, and diverged from the existing railway to the east of the Tame Vally, avoiding physical interaction with the majority of its alignment. A new junction to the south of Greenfield Station is shown on historic maps from the early 20th century as additional tracks toward Oldham were established from this station. However similarly to the Micklehurst loop, the additional lines diverged from the main Huddersfield line, running westwards at its intersection with Shaw Hall Bank Road Footway (MVL3/26). The railway was also widened to the east of Diggle to accommodate additional tracks serving new bores for the Standedge Tunnel which were added in 1868-71 and 1894, necessitating widening of bridges to the east of the route.

5.1.6 Piecemeal change has occurred on the Huddersfield & Manchester Railway, most notably with the closure of a small number of stations along the route, such as Diggle and Saddleworth Stations. The route today forms part of the wider Transpennine route between York, Selby and Manchester, which comprises sections of rail line developed by different railway companies.

5.1.7 The history and significance of the Transpennine route is discussed at more length in the Route-Wide Statement of Significance (Alan Baxter Associates, 2019). This was produced to characterise the overall heritage significance of the Transpennine route.

5.2 Shaw Hall Bank Road Footway (MVL3/26)

History

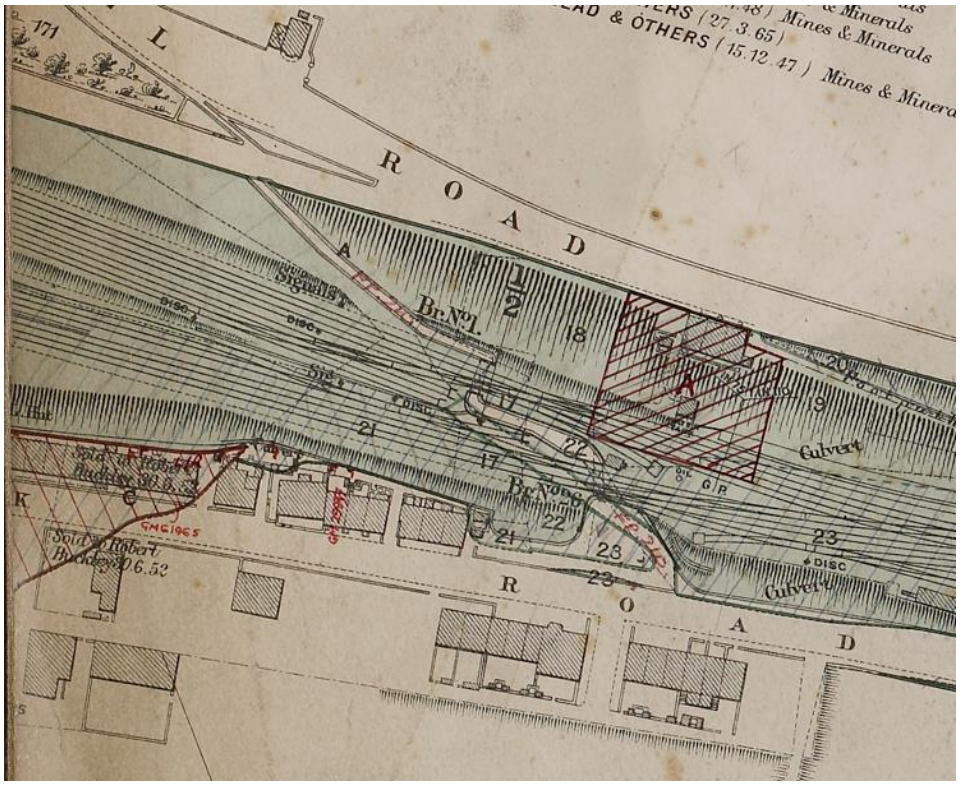
5.2.1 Shaw Hall Bank Road Footway (MVL3/26) was constructed between 1845 and 1849 during the Heroic Age of railway building. The single-span bridge was designed by A.S. Jee for the Huddersfield & Manchester Railway.

5.2.2 Shaw Hall Bank Road Footway (MVL3/26) is annotated as Shaw Hall Bank Bridge on the 1st edition 6-inch Ordnance Survey map of 1854, taking its name from the local place name of Shaw Hall Bank. The place name element *Shaw* is associated with the Shaw family of Upper Mill who were prominent landowners in the local area, with numerous farms, woollen mills and other interests within the Saddleworth area. Within the vicinity of Shaw Hall Bank Road Footway (MVL3/26) numerous references to the Shaw family can be seen on the 1st edition 6" Ordnance Survey map, including Shaw Hall, Shaw Hall Quarry, Shaw Hall T.P (telegraph post), Shaw Hall Barn and Shaw Hall Bank. Following the construction of the Huddersfield & Manchester Railway, Shaw Hall Bank Road Footway (MVL3/26) was constructed as an accommodation bridge to maintain the existing right of way across land to the north and south of the railway line.

5.2.3 The LNWR Oldham Branch opened between Greenfield Station and Oldham in 1856. The line was located directly to the north of Shaw Hall Bank Road Footway (MVL3/26), constructed on a separate embankment to the north of the underbridge (Insert 5-1). The east-west retaining wall located to the north of Shaw Hall Bank Road Footway (MVL3/26) is likely to relate to this arrangement.

5.2.4 The arrival and expansion of the railway during the second half of the 19th century fuelled gradual development to the south of Shaw Hall Bank Road Footway (MVL3/26). Terraces and a small number of detached structures are shown on subsequent Ordnance Survey editions in the later 19th and early 20th century to the south of the Railway line and MVL3/26 along the newly established road.

5.2.5 In the 20th century, the area to the south of the underbridge continued to gradually develop with residential buildings. In the mid-20th century, the Oldham Branch line was closed to passenger traffic as it was superseded by competing bus companies. The line continued in operation for freight until its closure in 1964. The route of the Oldham Branch is now a pedestrian walkway. Shaw Hall Bank Road Footway (MVL3/26) continues in active use part of the Transpennine route.



Insert 5-1 Historic line plan of the Huddersfield & Manchester Railway and Canal by LNWR in 1905 showing Shaw Hall Bank Road Footway (MVL3/26).

Description

5.2.6 Shaw Hall Bank Road Footway (MVL3/26) is a single span segmental-arched skew bridge which carries the two-tracks of the Transpennine route (see Insert 5-2 and Insert 5-3). The structure is constructed of rock-faced sandstone with ashlar detailing. Due to the local topography, the footbridge slopes downwards from north to south and consists of a single arch structure.

5.2.7 The bridge is formed by a segmental arch with V-jointed rusticated voussoirs which are keyed into the coursing of the spandrels, and a projecting keystone. The arch springs from an ashlar impost band supported on rusticated quoins, with a soffit of smaller, skew-coursed dressed ashlar blocks. On the south elevation of the underbridge, the arch is flanked by a pair of slightly battered projecting pilasters, with curving wing walls to either side. To the north elevation, a single pier is present to the right of the arch, with the wing wall extending beyond this. To the left of the arch, a retaining wall of roughly coursed rock-faced stone abuts the side of the arch, obscuring the fabric to the left. Constructed separately from the underbridge and of lesser quality and architectural refinement, this wall extends east-west along the side of the footpath and was constructed in association with the embankment for the Oldham Branch Line. Above the arch of Shaw Hall Bank Road Footway

(MVL3/26) is a stringcourse formed by two square-moulded bands with plain parapet above with ashlar coping over the flanking wing walls. The parapet is made of discrete stone blocks with a modern metallic tubular handrail set into it.

5.2.8 Architectural features include rusticated v-jointed voussoirs made of picked ashlar stone with tooled margins and a slightly projecting keystone. The structure is supported by impost bands which is also tooled with similar detailing which continued down to the quoins of the abutments. The walls of the north and south elevation are otherwise squared with coursed quarry-faced stone. The bridge survives in its original form, with no evidence of significant alteration.

5.2.9 The setting of Shaw Hall Bank Road Footway (MVL3/26) is somewhat localised given the nature of the topography and landscape surrounding the underbridge. Though its setting has undergone some change since the mid-20th century, its setting remains semi-rural due to the dense vegetation that engulfs the underbridge. The bridge is recessed from Shaw Bank Hall Road and despite the trees and vegetation, pockets of intervisibility remains visible from the road on its southern elevation (Insert 5-2). Its northern elevation is more obscured given the angle of the footpath which limits visibility in combination with the dense vegetation (Insert 5-3). Its relationship with the railway also contributes to its setting despite the limited visibility of the railway which limits the ability to appreciate this relationship.

Insert 5-2 Shaw Hall Bank Road Footway (MVL3/26), south elevation.

Insert 5-3 Shaw Hall Bank Road Footway (MVL3/26), north elevation.

Significance

5.2.10 The Shaw Hall Bank Road Footway (MVL3/26) was designated as a grade II listed building in 2018. The Historic England List Entry description identifies the bridge to be of special interest for to the following reasons:

- Historic interest:
    - Constructed during the heroic age of railway building and a little altered example of an 1840s accommodation underbridge on what is now one of the main railway lines in northern England;
    - Designed by the notable railway engineer Alfred Stanistreet Jee.
- Architectural interest:
    - As a well-designed bridge with good quality stone-masonry and attention to architectural detail in its use of a skew-coursed ashlar soffit, stepped, picked and tooled ashlar voussoirs with v-joints, ashlar parapet and contrasting rock-faced piers and curved wing walls which all lift it above the purely functional.
- Group value:
    - With the other listed structures designed by Jee on the Huddersfield & Manchester Railway line.

5.2.11 Shaw Hall Bank Road Footway (MVL3/26) is of significance as a largely unaltered example of an 1840s skew underbridge, dating from the Heroic Age (1841–50) of railway building and the period of

'railway mania' which marked a time of commercial confidence and expansion in the railways. The bridge's direct historic relationship with historic railway companies of the period, comprising the Huddersfield & Manchester Railway and LNWR, and the notable railway engineer A. S. Jee, who also designed similar structures along the route, give the structure historical value from which it derives significance. The bridge remains in use as a part of the operational railway network and, together with surviving contemporary structures, evidences the historic infrastructure of the Huddersfield & Manchester Railway.

5.2.12 Shaw Hall Bank Road Footway (MVL3/26) derives significance from the quality of its architecture and construction, a characteristic feature of Jee's work for the Huddersfield & Manchester Railway. Architectural elements such as the skew-coursed ashlar soffit, stepped and tooled ashlar voussoirs, ashlar parapet and contrasting rock-faced piers and curved wing walls are notable features of Jee's design which elevate the bridge above the purely functional. The design language used is consistent with other bridges built by A.S. Jee for the Huddersfield & Manchester Railway, which further contributes towards a consistency in architectural character and an appreciation of their group value.

5.2.13 The design and construction of Shaw Hall Bank Road Footway (MVL3/26) as a skew bridge contributes to its significance. Skew bridges represent a particular challenge in engineering terms and had been increasingly employed from the late 18th century by canal engineers to overcome the difficulties of canal crossings which were not perpendicular. Early uses on the railway included bridges by George Stephenson on the Liverpool and Manchester Railway (1828–1830) and James Walker on the Leeds and Selby Railway (1830–1834). Jee's use of skew arches on the Huddersfield & Manchester Railway, as at Shaw Hall Bank Road Footway (MVL3/26), represented a continuation of this practice, and provided an elegant solution to the challenges of the constrained and topographically challenging route through the Pennines.

5.2.14 The bridge survives in its original form, with no evidence of significant intervention or alteration, and remains in use for its original purpose. The integrity of the structure enables Jee's original design intent and the historic function of the structure to be understood, contributing to its significance. As a surviving and component feature along the wider railway network, its design contributes to the legibility of the Huddersfield & Manchester Railway in the contemporary landscape.

5.2.15 Shaw Hall Bank Road Footway (MVL3/26) does not draw particular significance from its setting save for its relationship with the railway. The underbridge continues to carry the railway over a pedestrian

footpath, evidencing the physical, functional and historic relationship with the railway. Views of the footbridge are limited given the topography and vegetation, however pockets of intervisibility can be appreciated from Shaw Bank Hall to the south and the footpath to the north.

Insert 5-4 Shaw Hall Bank Road Footway (MVL3/26) looking south towards Shaw Hall Bank Road.

Group value

5.2.16 As identified in the list description, Shaw Hall Bank Road Footway (MVL3/26) is recognised to be of group value with other listed structures by A.S. Jee on the Huddersfield & Manchester Railway[1]. These comprise:

- Heyrod Hall Footbridge (MVL3/7) (grade II listed, NHLE 1449242);

[1] Wheatley's Overbridge (MVL3/103) (grade II listed NHLE 1450537) was designed by A.S. Jee for the Huddersfield & Manchester Railway. The Overbridge was granted consent for extensive change as part of the Huddersfield to Westtown (Dewsbury) Order section of TRU, and will be demolished and replaced with a new structure (ref 2021/91337). This is likely to result in de-listing. As such its contribution to group value has therefore been excluded from this assessment.

- Springbank Lane Footbridge (MVL3/8) (grade II listed, NHLE 1452382);
- Spring Bank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (grade II listed, NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405);
- Wright's Mill Overbridge (MVL3/20) (grade II listed, NHLE 1452406);
- Wright's Overbridge (MVL3/23) (grade II listed, NHLE 1452409);
- Royal George Underbridge (MVL3/25) (grade II listed, NHLE 1451848);
- Oldham Road Overbridge (MVL3/28) (grade II listed, NHLE 1451853);
- Wickens Underbridge (MVL3/29) (grade II listed, NHLE 1451854);
- Uppermill Viaduct (MVL3/31) (grade II listed, NHLE 1068120);
- Slaithwaite Viaduct (MVL3/61) (grade II listed, NHLE 1224049);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);
- Milne Viaduct (MVL3/76) (Longwood Viaduct) (grade II listed, NHLE 1220121);
- Church Street (MVL3/82) (grade II listed, NHLE 1452083);
- Huddersfield Viaduct (MVL3/92) (grade II listed, NHLE 223531);
- Hillhouse Lane Underbridge (MVL3/94) (Willow Lane East) (grade II listed, NHLE 1432641); and
- B6118 Colne Bridge Road Overbridge (MVL3/107) (grade II, NHLE 1450265)[2].

5.2.17 Of this group, Manchester Road Underbridge (MVL3/10), Oldham Road Overbridge (MVL3/28), Church Street (MVL3/82) and Hillhouse Lane Underbridge (MVL3/94) bear a particular relationship to Shaw Hall Bank Road Footway (MVL3/26). All four structures are skew underbridges which utilise the same architectural detailing as

[2] B6118 Colne Bridge Road Overbridge (MVL3/107)) (grade II, NHLE 1450265) will be partially demolished and rebuilt with a supplementary structure replacing its spans over the railway. Listed building consent has been granted for this considerable intervention (ref: 2021/91330), and as a result may limit the contribution that this bridge makes towards the group value with the Jee bridges.

Shaw Hall Bank Road Footway (MVL3/26). As a group, these bridges are substantially unaltered, and evidence Jee's characteristic finely detailed construction, with elegantly skewed stone soffits.

5.2.18 The group value which Shaw Hall Bank Road Footway (MVL3/26) derives from these relationships provides an understanding of the wider trends and engineering achievement which characterise both the Huddersfield & Manchester Railway and the Heroic Age of railway building (1841-1850) more generally. This group value is enhanced by the structures continuing to form part of the operational railway; as a collective group of assets, they are experienced by those following the rail line (traveling on it, or near it).

5.2.19 Masonry railway bridges across the historic Huddersfield & Manchester Railway route have been characterised as being of local or regional interest, depending on their architectural quality, contribution to wider historical interest of the route, and their group value. It has been noted however that, as a group, they are not of substantial national interest due to their dating from a period of railway development when thousands of similar structures were erected (Alan Baxter Associates, 2019, 37).

5.3 Surrounding heritage assets

5.3.1 The location of the designated and non-designated heritage assets discussed below are shown in Appendix A.

Designated heritage assets

5.3.2 There is one listed building located within 250m of Shaw Hall Bank Road Footway (MVL3/26), comprising the grade II listed Wharmton Tower (NHLE 1068153) which is located c. 150m to the northwest. Designed by George Shaw of Uppermill, Wharmton Tower is a large-scale gothic revival house, built c. 1861. Situated on the steeply sloping hillside above the Transpennine route, due to the dramatic differences in land height and intervening mature vegetation, there is no intervisibility between the two listed structures. Consequently, Shaw Hall Bank Road Footway (MVL3/26) does not share any visual relationship with Wharmton Tower. Whilst there is some limited loose historical association due to the Shaw family connection, the two structures do not make a notable contribution to each other's significance.

Non-designated heritage assets

5.3.3 The Greater Manchester Historic Environment Record (HER) records two non-designated heritage assets within 250m of Shaw Hall Bank Road Footway (MVL3/26), one of which is a duplicate of

the listed Wharmton Tower noted above. The remaining record comprises a findspot located 230m to the east of Shaw Hall Bank Road Footway (MVL3/26), in which medieval carved stone heads (9003.1.1) were recovered.

6. PROPOSALS

6.1 Background to proposals

6.1.1 In order to achieve the TRU Programme objectives of improving journey times, capacity, overall reliability and resilience, and delivering environmental benefits, the electrification of the railway line and achievement of increased line speed is required. Works to the underbridges along the route are required to accommodate the resulting additional loadings on the structures resulting from increased line speeds and increases in train loading.

6.1.2 Shaw Hall Bank Road Footway (MVL3/26) is currently understrength. As such, provisions to safeguard the structure ahead of the increase in line speed are required. The increased line speed and train loading will impose increased horizontal forces on the underbridge. Without mitigation, this has the potential to affect the structural condition of the underbridge. The proposed design has therefore been developed to address these considerations, whilst safeguarding the significance of the structure.

6.2 Design development and justification

6.2.1 Key constraints taken into consideration during the development of proposals for Shaw Hall Bank Road Footway (MVL3/26) comprised:

- Time required working within the railway corridor is required to be minimised as far as possible to reduce risk to construction staff and the length of line possession (closure of the railway) and resulting disruption to railway service.
- The bridge's location within an area characterised by dense vegetation. These constraints, the accessibility of the site to construction vehicles and the delivery of materials/components.
- The designation of the bridge as a grade II listed structure places a requirement on Network Rail to have special regards for its preservation under the Planning (Listed Building & Conservation Areas) Act 1990.

6.2.2 During the ES3 design stage, proposals for Shaw Hall Bank Road Footway (MVL3/26) considered only installing upgraded GRP Handrails. During ES4 design stage, a comprehensive review was undertaken of the preferred options identified at ES3 across the whole of Route Section W2B as part of a validation exercise. At this

time, the requirement for strengthening of Shaw Hall Bank Road Footway (MVL3/26) was identified and proposals for the structure developed. The proposals for these works have been developed to minimise intervention into the historic structure and alteration of is appearance as far as possible, whilst mitigating the impact of increased line speed and heavier trains.

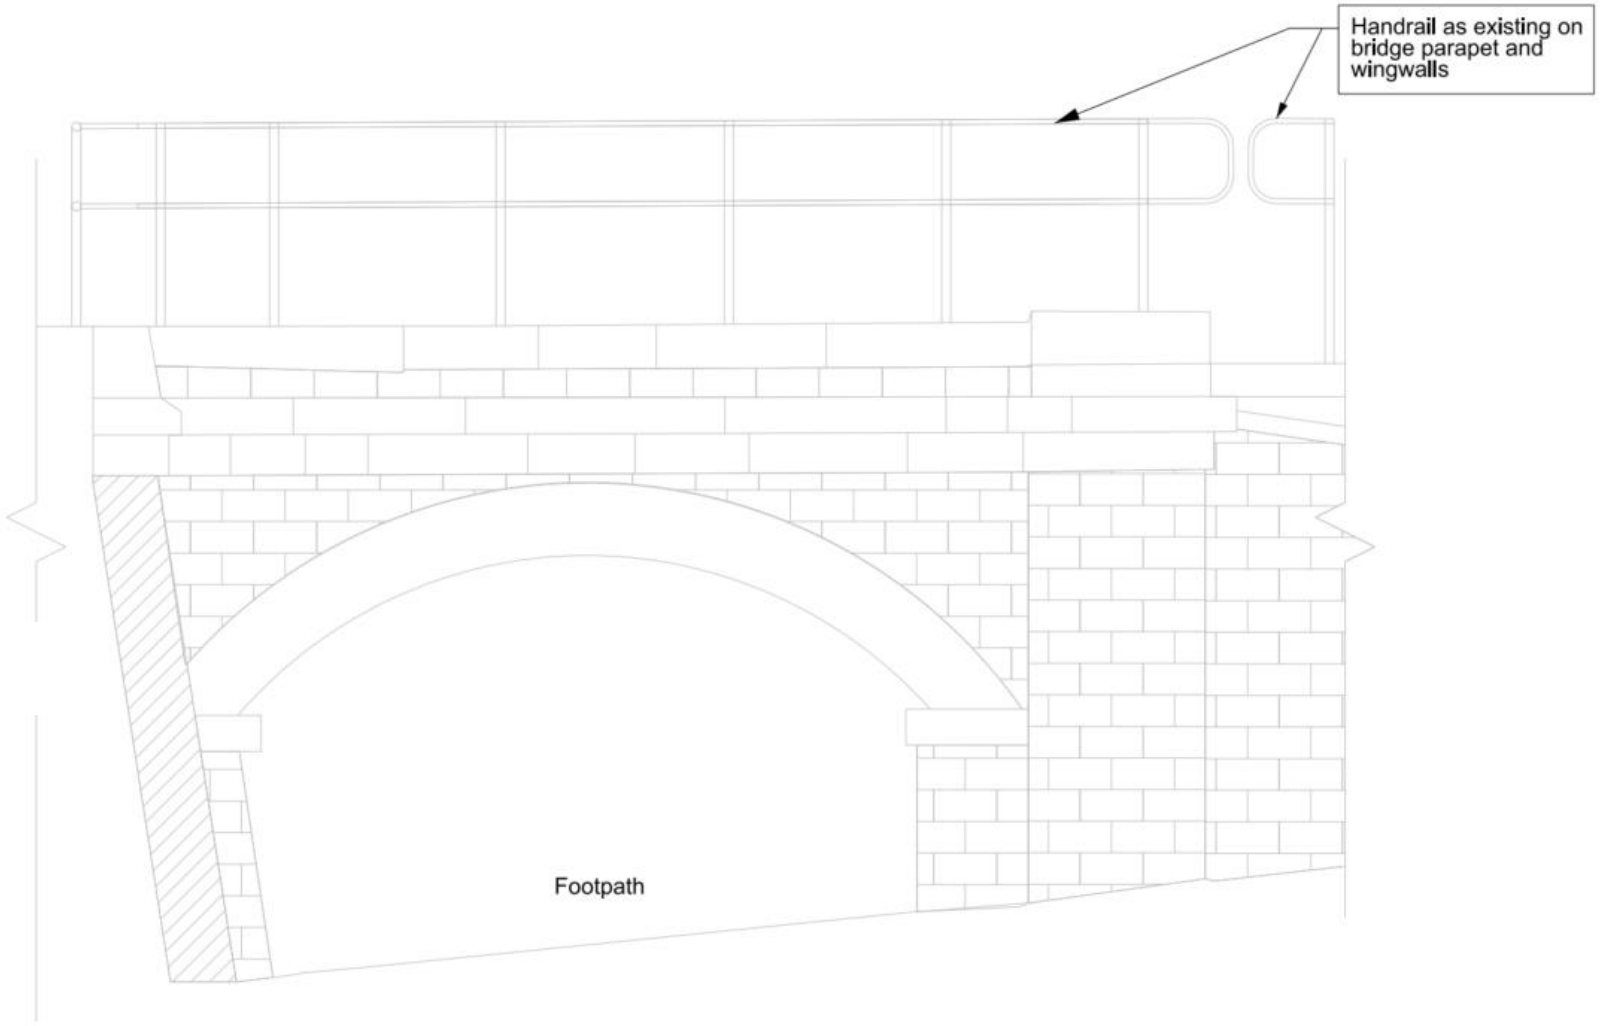
6.2.3 The proposals have been developed in consultation with Historic England and OMBC (as detailed above in Section 4). This iterative and robust design process has been undertaken to minimise the extent of interventions to the grade II listed underbridge in order to maintain the existing appearance and significance of the structure.

6.3 Description of proposals

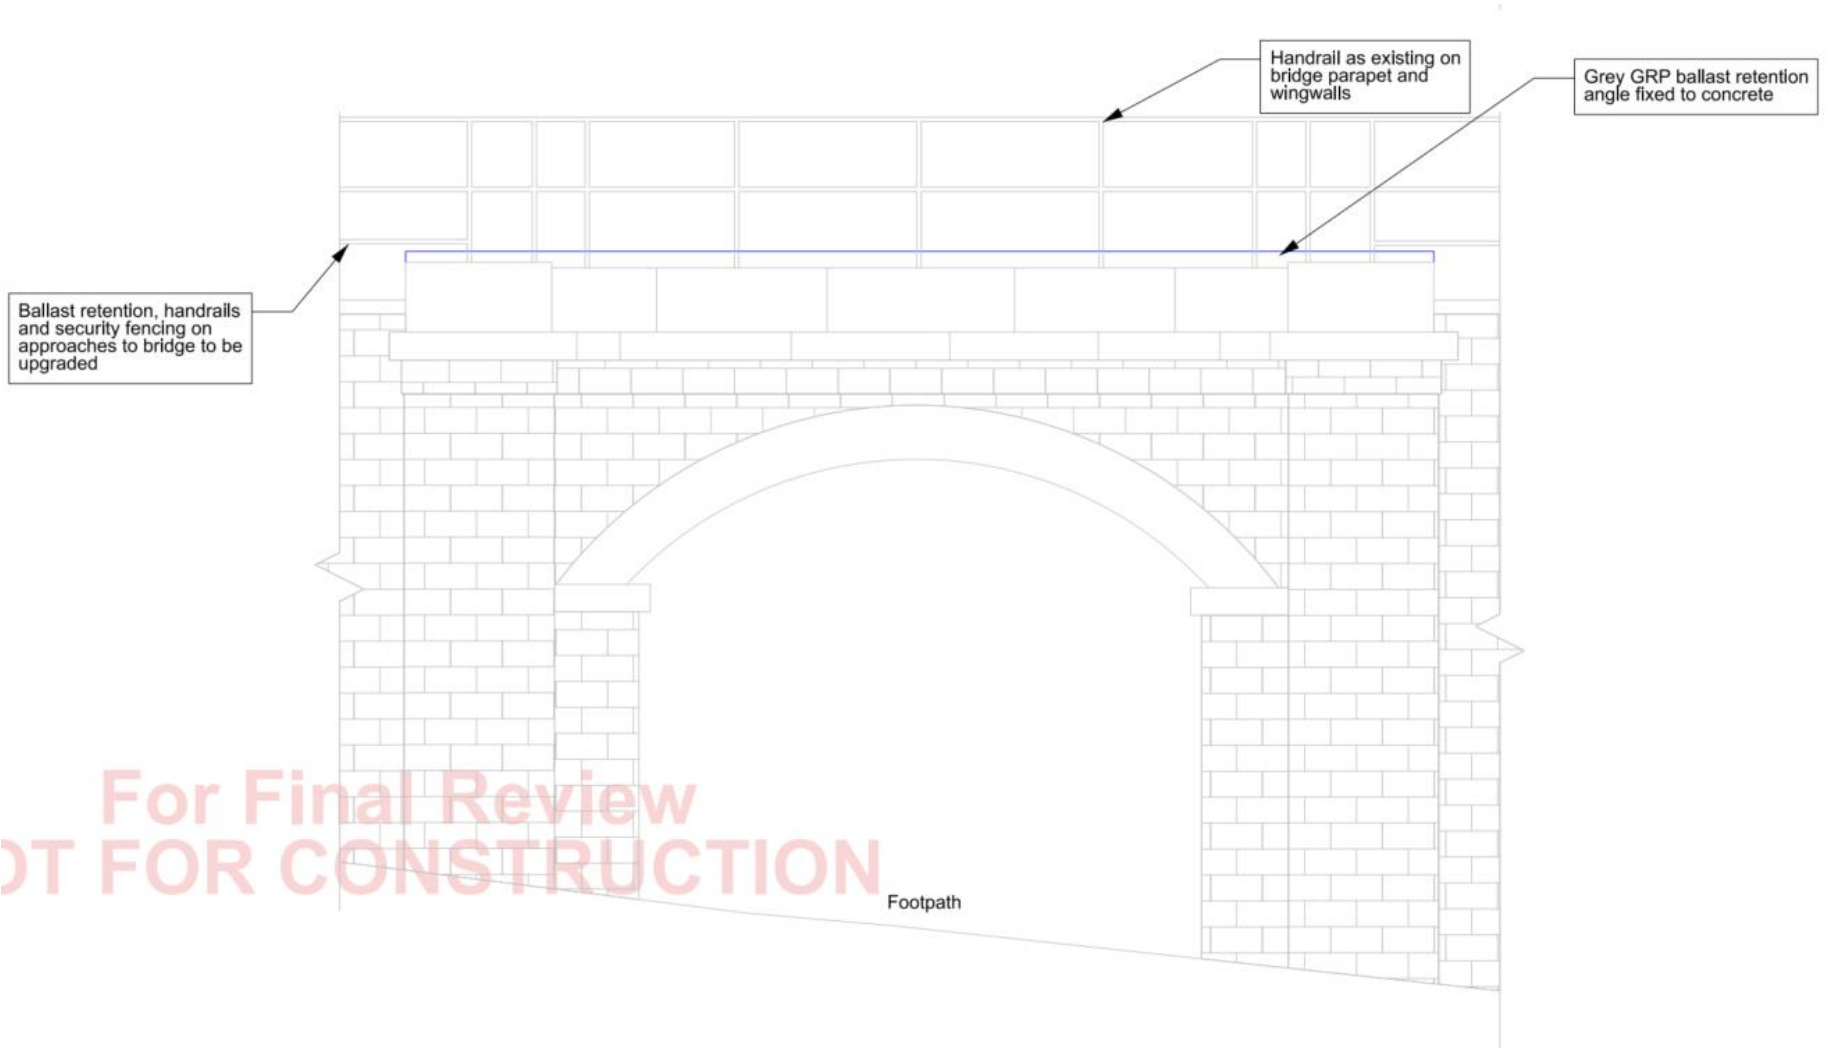
6.3.1 In order to achieve the aims of the TRU programme, it is necessary to re-align the track over Shaw Hall Bank Road Footway (MVL3/26), to increase ballast depth and to strengthen the structure in order to accommodate the increased forces placed on the underbridge by increased line speed and heavier trains (Insert 6-1 and Insert 6-2).

6.3.2 The alterations to the listed bridge would comprise the adjustment of the existing track bed on both lines. Two precast reinforced ‘L’ units would be installed to the inside of the underbridge parapets, below ballast level, extending across the bridge deck. Grout infill to the rear of the precast reinforced units and sand/cement bedding underneath would secure these in place and would not require drilling into the stone parapet or the stone arch below. An *in-situ* concrete stitch would be installed across the centre of the bridge deck between the precast reinforced units to secure these in place. These measures will enable for the precast reinforced units to perform as a singular structural unit, increasing the strength of the bridge and relieve the load from the existing parapets. A low grey GRP ballast retention angle would also be fixed along the inside of the east parapet.

6.3.3 The existing metal ‘kee clamp’ handrails across the structure would be retained and would be electrically earth bonded.



Insert 6-1 Proposed north elevation Shaw Hall Bank Road Footway (MVL3/26)



For Final Review
OT FOR CONSTRUCTION

Insert 6-2 Proposed south elevation Shaw Hall Bank Road Footway (MVL3/26)

Construction Methodology

6.3.4 The proposed works to Shaw Hall Bank Road Footway (MVL3/26) will comprise the following:

- Temporarily divert signalling and telecom (S&T) cables on top of the parapet.
- Install lateral restraint to outside of parapets if required.
- Remove track from Up and Down lines.
- Excavate ballast using tracked excavator.
- Prepare sand/cement bed ahead of placing precast reinforced concrete units.
- Install precast reinforced units using tracked excavator.
- Fix precast reinforced units and install concrete stitch along centre of the precast reinforced units.
- Backfill in-situ grout to rear of precast reinforced units.
- Reinstate ballast, S&T cables and track.
- Tamp track.

6.3.5 The proposed works to Shaw Hall Bank Road Footway (MVL3/26) are shown in the following drawings which accompany this application:

- Existing and Proposed Plan (167037-TGP-25-MVL3-DRG-T-LP-162602); and
- Existing and Proposed Elevation and Sections (167037-TGP-25-MVL3-DRG-T-LP-162603).

7. IMPACT OF PROPOSALS

7.1 Shaw Hall Bank Road Footway (MVL3/26)

7.1.1 The proposed works to the grade II listed Shaw Hall Bank Road Footway (MVL3/26) are required in order to safeguard the structure ahead of the upgrade of the line as part of the wider TRU Programme. These works would result in permanent minor alteration to the underbridge via the installation of precast reinforced units.

7.1.2 The installation of reinforced concrete strengthening to the bridge deck and parapets would result in a permanent localised change to the underbridge. The strengthening units would be secured in place using grout infill and sand/cement bedding, avoiding the need to fix into the masonry parapets. Though these works would result in some minor intervention into the existing underbridge, it would enable for

retention of the entire underbridge and would result in only slight physical impacts to the historic fabric.

7.1.3 The proposed reinforced concrete units have been sensitively and sympathetically developed to ensure that they result in very minor visual impacts. Whilst the majority of the precast reinforced concrete units would be located below ballast level, the top portion of these would rise above the ballast along the inside elevation of the parapets and would be visible from the bridge deck. With the exception of the ballast retention angle which would protrude very slightly above the east parapet, these works would not be visible in views of the external bridge elevations. The overall ability to appreciate the historic form, features and legibility of the underbridge which contribute towards its overall significance would be retained. Elements of interest recognised by Historic England including the ashlar impost bands, rusticated abutments and voussoirs, and pilasters, would be wholly retained. Given the nature of these proposals, there would be no impact on the overall aesthetic value of the underbridge.

7.1.4 The proposed reinforced concrete units have been sensitively and sympathetically developed to ensure that they do not create any substantial visual change to the structure. The design for the reinforced concrete units would retain the ability to appreciate the overall historic form, features and legibility of the underbridge which contribute towards its overall significance. Whilst the ballast retention angle would slightly protrude above the east parapet, this would form a very small element in the elevation and not form a prominent or intrusive feature. Elements of interest recognised by Historic England to contribute to the bridge's significance including the skew coursed ashlar soffits, tooled ashlar voussoirs and v-joints, ashlar parapets and curved rock-faced wing walls would be wholly retained and unaltered. Given the nature of these works, there would be no visual impact or detraction from its overall aesthetic value.

7.1.5 Shaw Hall Bank Road Footway (MVL3/26) derives significance from its association with the historic railway and engineer A.S. Jee, its construction within the Heroic Age (1841-1850) of railway building, and the quality of its architectural design. Though these works will introduce contemporary elements, namely the reinforced concrete strengthening, this would result in only slight physical impacts which would not detract from the aspects of its original design which contribute to its significance. Following the implementation of proposals, the historic value drawn from its associations with the Heroic Age of railway building, A.S. Jee and the Huddersfield & Manchester Route would continue to be understood and continue to contribute towards the underbridge's overall significance.

7.1.6 Shaw Hall Bank Road Footway (MVL3/26) does not derive particular significance from its setting, apart from its relationship with the historic and operational railway. The proposed works would not result in appreciable change to the relationship between the underbridge and the railway. Views of the underbridge from Shaw Bank Hall will be maintained.

7.1.7 Shaw Hall Bank Road Footway (MVL3/26) also derives significance from its group value with other A.S. Jee structures which share a common design language identifiable across the Huddersfield & Manchester Railway, particularly the masonry underbridges at Manchester Road Underbridge (MVL3/10), Oldham Road Overbridge (MVL3/28), Church Street (MVL3/82) and Hillhouse Lane Underbridge (MVL3/94). The proposed works would not negatively impact on the ability to appreciate its group value given that the historic form and features of Jee's design and contribution as part of the historic railway would not be altered. The proposals have been devised with an appreciation for the group value of the bridge by ensuring the appearance of the new precast reinforced units are sensitively incorporated into the historic underbridge.

7.1.8 The proposals would therefore result in less than substantial harm at the lower end of the scale, as agreed with Historic England in their letter of 29 November 2024.

7.2 Other heritage assets

7.2.1 Due to the minor nature of the works, the proposals would not result in any impact to any surrounding designated or non-designated heritage assets.

7.3 Mitigation

7.3.1 The design proposals have been developed to minimise impact on the fabric, form and appearance of Shaw Hall Bank Road Footway (MVL3/26). This has been achieved through the design development, undertaken in consultation with Historic England and OMBC. Measures incorporated into the design to mitigate impacts on the significance of the underbridge.

- Ensure the continued viable use of the structure as a part of the TRU network, and to safeguard it ahead of the electrification of the railway.
- Placement of precast reinforced units on the inside of the bridge deck to minimise visual and physical interventions into the historic structure.

7.3.2 In addition to these measures, Toolbox Talks would be undertaken in advance of construction works to Shaw Hall Bank Road Footway (MVL3/26). These talks would disseminate best practices for reducing potential impacts in relation to construction activities, for example to help avoid accidental damage.

Recommended compensation

7.3.3 In addition to these embedded measures, additional mitigation secured through the use of listed building consent conditions is recommended comprising:

- A scheme of historic building recording to Level 1 in accordance with Historic England guidance (Historic England, 2016). This would provide a permanent record of Shaw Hall Bank Road Footway (MVL3/26) in its current form and be lodged with the Greater Manchester Historic Environment Record.
- A scheme of permanent heritage interpretation would be developed and installed adjacent to Greenfield Station. This would provide the opportunity to engage members of the public with the heritage of the Huddersfield & Manchester Railway including the historic structures designed by A. S. Jee, such as Shaw Hall Bank Road Footway (MVL3/26). Further engagement with stakeholders with respect to the content of the interpretation would be undertaken during the detailed design phase.

7.4 Public benefit

7.4.1 The works proposed to be undertaken to Shaw Hall Bank Road Footway (MVL3/26) are required to ensure the realisation of the substantial public benefits of the Order Scheme.

7.4.2 As part of the wider TRU Programme, the Order Scheme would directly and indirectly play a role in improving regional connectivity and enhancing of some of Britain's busiest rail network, in turn realising economic, social and environmental objectives of the programme. The Transpennine route is identified as a key transport corridor, providing connections between cities in the North of England. The improvements in connectivity delivered by the TRU programme will support aspirations for economic growth and "levelling up" opportunities across the North of England.

7.4.3 The key objectives of the TRU programme are to achieve the part electrification of the Transpennine Route, improve journey times and capacity between key destinations, improve overall reliability and resilience of the route, and provide environmental benefits from

modal shift from road to rail freight reducing the number of heavy vehicles on the highway network and associated air pollution. The completion of the proposed works to re-align the track over Shaw Hall Bank Road Footway (MVL3/26) and strength the structure, would contribute towards delivering increases in line speed, capacity and resilience.

7.4.4 Electrification would deliver faster journey times and improved performance by allowing trains to accelerate faster, and brake more efficiently. The Order Scheme will deliver faster line speeds (80 mph throughout), improving journey times along the Transpennine Route, aiming to provide an improved journey time from Leeds – Manchester Victoria of 42-44 minutes and York to Manchester Victoria of 65-67 minutes. Works to the track and structures along the Route, including Shaw Hall Bank Road Footway (MVL3/26), are required to accommodate this increase, and without these changes the Scheme would be unable to go ahead.

7.4.5 As a vital constituent part of the Order Scheme, the proposed works at Shaw Hall Bank Footway (MVL3/26) would also facilitate indirect benefits associated with the wider programme of works, including station upgrades, track renewal and signalling improvements.

7.4.6 The reliability and resilience of the route and services operating on it will be improved by replacement of existing infrastructure with electrification equipment, new track drainage and signalling. Modern signalling equipment will reduce the headway between trains, allowing them to run closer together which will in turn provide increased capacity. The Scheme will provide the capability to operate four ‘express’, two ‘semi-express’ services and up to two local services an hour on the Route and will provide increased flexibility to timetable more train paths.

7.4.7 Electrification of the Scheme would provide substantial environmental and sustainability benefits and is an investment in ‘greener’ energy technology. This supports Network Rail’s Decarbonisation Strategy and is bolstering national targets for reducing harmful emissions that cause climate change, which are set out in Government legislation for achieving net zero carbon by 2050.

7.4.8 The Order Scheme will also deliver improved safety through measures including replacement of two level crossings, installation of additional safety measures on existing bridges; enhancements to the local highway networks and new pedestrian crossing points at locations including Greenfield and Mossley Stations. Accessibility of the railway network will also be improved with the provision of fully accessible stations at Greenfield Station and the relocated Mossley

Station. These measures are being brought forward as part of the wider TRU Scheme to electrify and modernise the Route, as facilitated, in part, by the works to Shaw Hall Bank Road Footway (MVL3/26).

7.4.9 Significant residual beneficial effects arising from the operation of the wider TRU Scheme have been previously identified in the Huddersfield-Westtown TWA Order Inquiry from December 2021. These included recognition of improved journey times, reliability, and capacity at the Local Authority area and in turn the sub-regional and regional level. These improvements will bring direct significant benefits to local businesses and the labour market through improved access to the local regions along the section of the route from Stalybridge to Diggle.

7.4.10 To this effect, the proposals at Shaw Hall Bank Road Footway (MVL3/26) are therefore essential in achieving the overall substantial public benefits of Route Section W2B and wider objectives of the Order Scheme, and without these interventions, the Order Scheme would not be able to be safely and successfully implemented. Alongside these substantial public benefits, the delivery of heritage interpretation adjacent to Greenfield Station would enable public engagement with the heritage of the Huddersfield & Manchester Railway, its architecture and significance.

8. CONCLUSION

8.1.1 The significance of Shaw Hall Bank Road Footway (MVL3/26) lies primarily in its historic and architectural interest. The underbridge is a large unaltered example of a masonry underbridge dating to the Heroic Age (1841-1950) of railway building. The underbridge derives significance from its direct historic relationship with notable railway engineer A.S. Jee and the Huddersfield & Manchester Railway and LNWR. The high quality of the underbridge's architecture, which includes skew-coursed ashlar soffit, ashlar voussoirs and v-joints, ashlar parapets and rock faced piers, together with the quality of workmanship, are characteristic of A.S. Jee's works recognised across the wider Huddersfield & Manchester Railway. It also retains group value as one of number of A.S. Jee structures on the Transpennine route which share a common design language.

8.1.2 The proposals for Shaw Hall Bank Road Footway (MVL3/26) have been developed and undertaken in consultation with Historic England and OMBC and have been developed to minimise the impact on the listed underbridge as far as possible. Special regard has been given to the desirability of preserving or enhancing the structure or its setting or any features of special architectural or

historic interest which it possesses. The proposals therefore comprise:

- Strengthening of the bridge through installation of precast reinforced units to the deck of the bridge, inside the parapets.

8.1.3 The works would result in minor alteration of the structure and would preserve key aspects that contribute to its overall significance including its architectural quality, detailing and construction. Whilst the proposals would introduce modern materials into the historic structure, these works have been developed to be as visually unobtrusive as possible. Additionally, the group value of Shaw Hall Bank Road Footway (MVL3/26) with other A.S. Jee bridges for the Huddersfield & Manchester Railway would be maintained.

8.1.4 With the works to Shaw Hall Bank Road Footway (MVL3/26), the Order Scheme can achieve key improvement objectives as outlined in Section 7.4. It would also support the achievement of substantial public benefits related to:

- Improved efficiency and reliability of the railway (in journey time saving and increased capacity);
- Reduction of delays to trains and other highway users (improved efficiency of the railways means fewer heavy vehicles on the highway network causing traffic issues and contributing to air pollution);
- Supporting sustainable transport development in line with Network Rail's Decarbonisation Strategy; and
- Improving public health and safety in providing safe routes across the railway.

8.1.5 In addition to this, the delivery of a programme of heritage interpretation at Greenfield Station would provide the opportunity for engagement of the public with the heritage of the Huddersfield & Manchester Railway.

8.1.6 The works to Shaw Hall Bank Road Footway (MVL3/26) would result in less than substantial harm to the significance of the listed building, at the lower end of the scale, as defined under the NPPF. Substantial public benefits would outweigh the less than substantial harm to the significance of Shaw Hall Bank Road Footway (MVL3/26), therefore meeting the requirements of the NPPF (paragraph 215) in relation to the justification for less than substantial harm. The proposals would also satisfy the requirements of Policy 24 of the Oldham Joint Core Strategy and Development Management Policies (2011), in relation to the impact on the character of the listed building, and preservation of its architectural style and features. It would also satisfy Policy JP-

P2 contained within Greater Manchester Combined Authority's Places for Everyone (2024). The proposals therefore satisfy both national and local policy requirements in relation to the justification for harm to significance of Shaw Hall Bank Road Footway (MVL3/26).

APPENDIX B – NATIONAL HERITAGE LIST DESCRIPTION

Official list entry

Heritage Category:	Listed Building
Grade:	II
List Entry Number:	1451852
Date first listed:	23-Mar-2018
List Entry Name:	Railway accommodation underbridge MVL3/26, Footway
Location Description:	Off Shaw Hall Bank Road, Greenfield.

Location

The building or site itself may lie within the boundary of more than one authority.

District:	Oldham (Metropolitan Authority)
Parish:	Saddleworth
National Grid Reference:	SD9894204527

Summary

Accommodation underbridge for the Huddersfield & Manchester Railway. Mid-late 1840s for the railway line with A S Jee as lead engineer.

Reasons for Designation

The accommodation underbridge MVL3/26, off Shaw Hall Bank Road, Greenfield, constructed in the mid-late 1840s by A S Jee for the Huddersfield & Manchester Railway, is listed at Grade II for the following principal reasons:

Historic interest:

* constructed during the heroic age of railway building and a little altered example of an 1840s accommodation underbridge on what is now one of the main railway lines in northern England;

* designed by the notable railway engineer Alfred Stanistreet Jee.

Architectural interest:

* as a well-designed bridge with good quality stone-masonry and attention to architectural detail in its use of a skew-coursed ashlar soffit, stepped, picked and tooled ashlar voussoirs with v-joints, ashlar parapet and contrasting rock-faced piers and curved wing walls which all lift it above the purely functional.

Group value:

* with the other listed structures designed by A S Jee on the Huddersfield & Manchester line.

History

In contrast to the main trunk lines of the late 1830s that were constructed by single railway companies, the route from Stalybridge to Leeds had fragmented origins and was the work of three different railway companies: the Huddersfield & Manchester Railway, Leeds, Dewsbury & Manchester Railway, and the Manchester & Leeds Railway.

The Huddersfield & Manchester Railway was authorised in 1845 and followed the route of the Huddersfield Narrow Canal for much of its length, including a railway tunnel through the Pennine hills set alongside the earlier Standedge Canal Company tunnel of 1811; in 1846 the railway company also acquired the canal. Joseph Locke and Alfred Stanistreet Jee were appointed to survey and design the new line, the two engineers having already worked together on a major project linking Manchester and Sheffield. Jee became the lead engineer for the Huddersfield line, which passed through challenging terrain, assisted by resident engineers that included his brother Moreland Jee (until 1848) and Herbert F Mackworth. Construction of the line was divided into various contracts, with many contractors being only responsible for a single cutting, viaduct or tunnel portal. The largest contract for the Standedge Tunnel between Diggle and Marsden was let to a single contractor, Thomas Nicholson in 1847. The tunnel's completion in 1849 marked the opening of the line.

The Leeds end of the route, which was also authorised in 1845, was constructed by the Leeds, Dewsbury & Manchester Railway. The engineer was Thomas Grainger who had previously largely worked in Scotland, and the line was completed in 1849.

A short three-mile section of the route between Heaton Lodge Junction and Thornhill Junction near Mirfield was developed by the Manchester & Leeds Railway and was constructed between 1837 and 1840, with George Stephenson as the chief engineer. The structures on this line were designed by Thomas Gooch under the oversight of Stephenson. In 1847 the railway company changed its name to the Lancashire & Yorkshire Railway.

In 1847 the Huddersfield & Manchester Railway and the Leeds, Dewsbury & Manchester Railway were acquired by the London & North Western Railway (LNWR) so that the company could access the city of Leeds and the textile towns of West Yorkshire. This pitted them as rivals to the Lancashire & Yorkshire Railway, although at points on the route the two companies had to work together. By 1851 the London & North Western Railway had an overall mileage of railway track of 800 miles and it became the most prominent railway company in the country and the largest joint-stock concern in the world in the late C19. Although the LNWR had a general manager, Captain Mark Huish, the lines of the Stalybridge to Leeds route still managed their own affairs. LNWR later carried out expansion works, including the widening of tracks and bridges, the construction of additional tunnels, and station alterations. In 1923 the line became part of the London Midland & Scottish Railway, and subsequently part of the nationalised British Railways in 1948. The line, its structures and track are currently (2018) owned by Network Rail, and the passenger services operated by Trans Pennine Express and Northern Rail.

This underbridge accommodates a footpath beneath the railway line. It dates to the construction of the Huddersfield & Manchester Railway between 1845 and 1849 when A S Jee was the lead engineer. (The railway line and the footpath are shown on the first edition 1:10,560 OS map surveyed between 1849 and 1851 and published in 1854.)

Details

Accommodation underbridge for the Huddersfield & Manchester Railway. Mid-late 1840s for the railway line with A S Jee as lead engineer.

MATERIALS: rock-faced and ashlar sandstone (shale grit/Kinderscout grit/millstone grit).

DESCRIPTION: the skew accommodation bridge carries the two-line railway track over a footpath which slopes steeply down towards the south. The bridge has deep, segmental arches with stepped voussoirs and slightly taller keystones. The v-jointed voussoirs are of picked ashlar with tooled margins. They spring from an ashlar impost band with similarly detailed ashlar quoins to the bridge abutments, which are otherwise constructed of coursed, rock-faced stone blocks, as are the spandrels. The bridge soffit is constructed of smaller, skew-coursed, dressed ashlar blocks. The bridge arches are framed by slightly projecting piers of rock-faced stone. The ashlar parapets encompass the archway and the piers and have a slightly projecting, square-moulded band with deeper panels above. The curved wing walls are constructed of coursed, rock-faced stone blocks with square-moulded ashlar coping.

29 November 2024

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the meetings on 6 and 21 November 2024 to review the proposals for bridges MVL3/9, 10, 23, 25, 26, 28, 29 and 31. As before, it was helpful to see the drawings in advance and then talk through the proposals with the team.

The impacts of the proposed changes and our comments are detailed below:

Proposals at *Manchester Road underbridge MVL3/10*, *Shaw Hall Bank Road underbridge MVL3/26* and *Wickens underbridge MVL3/29* will involve minor works, consisting of renewal of railings and strengthening of parapets with reinforced concrete. Visually, there will be only a minor impact, as the replacement railings are similar to the existing and the concrete strengthening will be hidden from view by the parapets. There will be a very low level of less than substantial harm to the physical fabric of the bridges due to the new railings being grouted into cored holes in the masonry parapet blocks. We do not have concerns over the works at these three bridges and recognise the efforts to maintain the visual appearance on the bridges.

The proposals for *Spring Bank Lane overbridge MVL3/9* and *Uppermill Viaduct MVL3/31* have been discussed at previous meetings, and it was helpful to see further details of the works at these structures. There will be a low level of less than substantial harm to *Spring Bank Lane overbridge* due to the introduction of raised copers, however the use of colour-matched concrete here will help to mitigate some of the harm caused by the visual impact of the new copers. Works to *Uppermill Viaduct* will likewise lead to a low level of less than substantial harm due to the introduction of brackets to support the OLE portals which will have an impact both physically and visually. We appreciate that care has been taken in the spacing of these portals so the rhythm of the bridge arches is not unduly interrupted, and so that the pattress plates are not affected.

More considerable impacts will result from proposals at *Wright's overbridge MVL3/23*, *Oaklands Road underbridge MVL3/25* and *Oldham Road overbridge (Greenfield*

Historic England

Station) MVL3/28, all of which will result in substantial harm to the significance of the designated assets.

As mentioned in previous letters, the removal of *Wright's Overbridge* will cause substantial harm to its significance through the total loss of its historic form and all original fabric, and through the re-routing of a historic public footpath. Thorough justification will need to be presented in the supporting documentation to provide the reasoning for the total loss of this bridge.

The proposed reconstruction of *Oldham Road Overbridge* has also been discussed previously. This is a skew overbridge located on the north-east side of Greenfield Station which carries Oldham Road over the track below. The bridge currently has a masonry arch which will be dismantled, along with much of the approaching wing walls, resulting in very little historic fabric being retained. The works will also necessitate the removal of the ornate historic iron railway footbridge. There will be substantial harm to the significance of the listed asset due to the severity of changes to its physical appearance and the loss of historic fabric. We recognise that some fabric will be retained for reuse as cladding material, however this will need to be carefully managed to maintain the look of the structure. The stone coursing in the existing bridge runs through the parapets into the wing walls. We would like to see care taken to replicate this effect within the reconstructed bridge to avoid a disjointed appearance to the new structure, which could arise from using mismatched stone-cladded panels. The existing bridge features flat masonry pilasters that project slightly from the bridge to either side of the arch. These have not been articulated in the proposed design and we would like to see further investigation into whether they could be incorporated into the design. This location would be suitable for display of permanent interpretation materials which could help to mitigate some of the harm by informing the public about the history of the route and the upgrade works.

Oaklands Road underbridge MVL3/25 is a skew girder bridge carrying the two-track railway line over a bend in the road below. The angled abutments have distinctive semi-octagonal piers, and the parapets are ornate balustrades of decorative cast-iron panels of Gothic arcading. The craftsmanship of the stonemasonry and attention to architectural detail lifts the design of this bridge above the purely functional and it has considerable architectural interest. There will be substantial harm to the significance of this listed bridge resulting from the proposals to reconstruct and widen the bridge deck and to rebuild the octagonal piers. In order to minimise the harm, the design of the rebuilt piers and abutments will need to be careful managed to ensure there is meaningful articulation of the distinctive shape of the piers. This includes the contrasting shape and dimensions of the piers where they extend through and above the parapet. We are comfortable with the proposals to replicate the decorative cast-iron panels to minimise the visual impact of the loss of the original fabric here.

Our ref: PA01200823
18 July 2025

Dear Sarah

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the recent meetings to review the draft Heritage Statements that will be submitted for Listed Building Consent applications for changes to bridges on the proposed Transpennine Route Upgrade line.

The Heritage Statements are well considered and it is clear that alternative options to reconstruction have been investigated in each case, which are helpfully set out in tables in the reports. The proposals will result in substantial harm to listed bridges along the route, however clear justification for this has been set out in the Heritage Statements.

We very much welcome the inclusion of heritage interpretation at Greenfield Station. This is a significant early rail route and there is notable educational potential in the material that has been generated from the research into the railway structures as part of this project.

Regarding Oaklands Road underbridge MVL3/25, we are comfortable with the design of the proposals for the reconstruction of the parapet and stone turrets. These have been carefully considered to minimise the visual impact.

Next Steps

We appreciate having been involved at pre-application stage in this important project, and value being able to feed into design plans. If you require further pre-application advice please get in touch.

Yours sincerely

1. INTRODUCTION

1.1 Transpennine Route Upgrade

1.1.1 The Transpennine Route Upgrade (TRU) is a major, multi-billion pound program of improvements to increase capacity, improve journey time and reliability performance of rail services on the Transpennine Route.

1.1.2 The TRU will aim to deliver:

- An improved journey time for Leeds – Manchester Victoria of 42-44mins;
- An improved journey time for York to Manchester Victoria of 65-67mins;
- Capability to operate four 'express' and two 'semi-express' services an hour;
- Capability to operate up to two 'local services' an hour on the route;(subject to future operating timetables);
- Performance of the Transpennine Route to be 92.5% or higher each period;
- Larger freight containerisation capability (W12 gauge);
- Freight paths/rights to be retained as existing; and
- A contribution to Network Rail's Decarbonisation Strategy and climate policy.

1.1.3 The Network Rail (Stalybridge to Diggle (Saddleworth) Enhancements) Order Scheme extends from Stalybridge Tunnel, in the west, through to the western portal of Standedge Tunnel (the "Scheme"). This section of the Transpennine route follows the Tame Valley from Stalybridge to Diggle, and is referred to hereafter as Route Section W2B.

1.1.4 The TRU programme in Route Section W2B involves a variety of works including the electrification of the railway (installation of overhead line equipment (OLE) and associated infrastructure reconstruction and modification of existing bridges to facilitate electrification of the railway, construction of a new station at Mossley, closure of Stockport Road Level Crossing and Moorgate Halt Level Crossing, railway works at Greenfield Station to support the upgrade

and electrification of the railway track reconfiguration works and track lowering works through Stalybridge and Scout Tunnels.

1.1.5 Under the Planning (Listed Buildings and Conservation Areas) Act 1990, consent is required from the local planning authority for any proposed works that would affect the character of a listed building. The Transport and Works Act 1992 introduced section 12(3A) into the Planning (Listed Buildings and Conservation Areas) Act 1990, the effect of which is to "call-in" for determination by the Secretary of State applications to the local planning authority for listed building consent where such consent is required in consequence of proposals included in an application for a Transport and Works Act Order (TWAO). The procedures in the Transport and Works Applications (Listed Buildings, Conservation Areas and Ancient Monuments Procedure) Regulations 1992 then apply to the call in of such listed building consent applications.

1.1.6 This Heritage Statement has been compiled in support of an application for listed building consent by Network Rail in respect of the proposed works on the grade II listed Oldham Road Overbridge (MVL3/28) (NHLE 1451853). A location plan is provided in Appendix A.

1.1.7 The Historic England list description (included in full in Appendix B) names the listed building as “Railway Overbridge MVL3/28, Oldham Road”. Throughout this Heritage Statement the structure is referred to as “Oldham Road Overbridge (MVL3/28)” in accordance with Network Rail’s naming of the structure.

1.1.8 The preparation of this assessment has been informed by the Statement of History and Significance: West of Leeds1 and the Route-wide Statement of Significance (Alan Baxter Associates, 2019).

1.2 Scope

1.2.1 The requirement for assessment and its scope is guided by policy contained within the National Planning Policy Framework (NPPF 2025) specifically paragraph 207, which seeks an assessment proportionate to the asset’s importance and sufficient to understand the potential impacts of development. The specific scope of this assessment is determined by Network Rail’s requirement to provide an objective assessment of the heritage value of assets that may be affected by the Scheme, and to appraise the nature and extent of any impact upon setting and significance.

1.2.2 This Heritage Statement will:

- Identify and discuss the heritage significance of the listed structure, including the contribution of setting;
- Present the design requirements of the Scheme at the structure;
- Present the process of development and optioneering which has led to the design proposal for the Scheme in relation to the structure;
- Identify the impacts of the design proposal on the significance of the structure, in the context of current national and local planning policy and guidance;
- Discuss any mitigation recommended in relation to the structure; and
- Consider the public benefits to be gained from the Scheme weighed against the impact on the significance of the structure, in line with the NPPF and the Oldham Local Development Framework, 2011.

1.3 Current Conditions

1.3.1 Oldham Road Overbridge (MVL3/28) (Insert 1-1) is a single span skew overbridge built to carry Oldham Road (A670) across the historic Huddersfield & Manchester Railway. The overbridge is situated on the western edge of the village of Greenfield (NGR SD9859804392), c. 7 km east of Oldham. It comprises a single segmental-arched bridge, which carries vehicular traffic over the railway via Oldham Road (the A670).

1.3.2 The structure was subject to a detailed examination as part of Network Rail's maintenance regime in June 2016, which identified it to be in fair condition, with the exception of the parapets and pilasters which were identified to be in poor condition due to repeated vehicle strikes (Insert 1-2). Defects identified included:

- Poor condition of parapets due to vehicle strikes;
- Damage to existing palisade fencing from vehicle strike;
- Fractures and spalling of stonework, some of which are identified to be long-standing (Insert 1-3);
- Slight seepage from the bridge soffit;
- Missing pointing from isolated joints; and
- Leaning parapets.

1.3.3 A visual inspection undertaken in September 2021 again identified the long-standing issue of vehicle impacts to the inside of the bridge

parapets, with further impacts and displacement of stonework and copings, and damage to stonework and movement of copings. Since the completion of the visual survey in 2021, a further five rapid response surveys have been undertaken due to vehicles crashing into the bridge parapets.

Insert 1-1 Oldham Road Underbridge (MVL3/28), south-western elevation

Insert 1-2 Displaced capstone on bridge parapet.

Insert 1-3 Scrape marks and displacement of coping from vehicle strikes

Insert 1-4 Standing fractures to the bridge abutments.

1.4 Summary of proposal

1.4.1 In order to achieve the TRU Programme objectives, electrification of the Route is required as part of the construction of the Order Scheme. This requires alteration of a number of existing bridges, including Oldham Road Overbridge (MVL3/28) to accommodate OLE. Following optioneering, it has been determined to be necessary to reconstruct Oldham Road Overbridge (MVL3/28) to enable implementation of the Order Scheme.

2. LEGISLATION AND POLICY CONTEXT

2.1 Legislation

2.1.1 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) (the "Act") governs the designation and works to listed buildings in England.

2.1.2 The Act states in s.1 (5):

'*In this Act "listed building" means a building which is for the time being included in a list compiled or approved by the Secretary of State under this section; and for the purposes of this Act—*

a) *any object or structure fixed to the building;*

b) *any object or structure within the curtilage of the building which, although not fixed to the building, forms part of the land and has done so since before 1st July 1948, shall be treated as part of the building.'*

2.1.3 Under the Act, no one is permitted to undertake or cause to be undertaken any works that would affect the character of a listed building unless the works are authorised. Section 16 of the Act identifies that whether such works can be carried out is determined by the local planning authority or the Secretary of State:

1) *'Subject to the previous provisions of this Part, the local planning authority or, as the case may be, the Secretary of State may grant or refuse an application for listed building consent and, if they grant consent, may grant it subject to conditions.*

2) *In considering whether to grant listed building consent for any works the local planning authority or the Secretary of State shall have special regard to the desirability of preserving and enhancing the building or its setting or any features of special architectural or historic interest which it possesses.*

3) *Any listed building consent shall (except in so far as it otherwise provides) ensure for the benefit of the building and of all persons for the time being interested in it.'*

2.1.4 In relation to the granting of listed building consent, Section 17 of the Act stipulates that conditions attached to listed building consent may include those with respect to:

a) ' the preservation of particular features of the building, either as part of it or after severance from it;

b) the making good, after the works are completed, of any damage caused to the building by the works; [and]

c) the reconstruction of the building or any part of it following the execution of any works, with the use of original materials so far as practicable and with such alterations of the interior of the building as may be specified in the conditions'.

2.1.5 It is also defined in s.17 (2) that a condition '*may also be imposed requiring specified details of the works (whether or not set out in the application) to be approved subsequently by the local planning authority or, in the case of consent granted by the Secretary of State, specifying whether such details are to be approved by the local planning authority or by him'*.

2.1.6 The Act also states in s.66 (1):

'In considering whether to grant planning permission or permission in principle for development which affects a listed building or its setting, the local planning authority or, as the case may be, the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses'.

2.2 National Policy

2.2.1 The National Planning Policy Framework (NPPF, 2025) sets out the Government's planning policies for England and how these should be applied to contribute to the achievement of sustainable development, supported by the Planning Practice Guidance (updated July 2019) (MHCLG, 2019).

2.2.2 Section 2 of the NPPF outlines the principles of achieving sustainable development including, in Paragraph 8, an environmental objective 'to protect and enhance our natural, built and historic environment'. Paragraph 9 sets out that these objectives should be delivered through the preparation and implementation of plans and the application of the policies within the NPPF. Section 16 of the NPPF deals specifically with the historic environment. Where changes are proposed, the NPPF sets out a clear framework to ensure that heritage assets are conserved, and where appropriate enhanced, in a manner that is consistent with their significance.

2.2.3 This Heritage Statement aims to address relevant policy within the NPPF in relation to Section 16 'Conserving and enhancing the historic environment' which includes guidance on plan making, managing Historic Environment Records; how to determine proposals affecting the historic environment; and how to consider potential impacts on significance.

2.2.4 The following paragraphs as set out in the NPPF include key provisions considered of particular importance to this application:

- Paragraph 207 – '*In determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand the potential impact of the proposal on their significance.'*
- Paragraph 212 – '*When considering the impact of a proposed development on the significance of a designated heritage asset, great weight should be given to the asset's conservation (and the more important the asset, the greater the weight should be). This is irrespective of whether any potential harm amounts to substantial harm, total loss, or less than substantial harm to its significance*.'
- Paragraph 213 – '*Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification. Substantial harm to or loss of:*

  a) *grade II listed buildings, or grade II registered parks or gardens, should be exceptional;*

  b) *assets of the highest significance, notably scheduled monuments, protected wreck sites, registered battlefields, grade I and II* listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional.'*

- Paragraph 214 – '*Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss, or all of the following apply:*

  a) *the nature of the heritage asset prevents all reasonable uses of the site; and*

  b) *no viable use of the heritage asset itself can be found in the medium term through appropriate marketing that will enable its conservation; and*

  c) *conservation by grant-funding or some form of not for profit, charitable or public ownership is demonstrably not possible; and*

d) *the harm or loss is outweighed by the benefit of bringing the site back into use.'*

- Paragraph 215 – '*Where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate, securing its optimum viable use.'*
- Paragraph 216 – '*The effect of an application on the significance of a non-designated heritage asset should be taken into account in determining the application. In weighing applications that directly or indirectly affect non-designated heritage assets, a balanced judgment will be required having regard to the scale of any harm or loss and the significance of the heritage asset.'*
- Paragraph 219 - *'Local planning authorities should look for opportunities for new development within Conservation Areas and World Heritage Sites, and within the setting of heritage assets, to enhance or better reveal their significance. Proposals that preserve those elements of the setting that make a positive contribution to the asset (or which better reveal its significance) should be treated favourably.'*

Planning Practice Guidance

2.2.5 The Planning Practice Guidance (PPG) (MHCLG, 2019) provides further advice and guidance that expands the policy outlined in the NPPF. It expands on terms such as 'significance' and its importance in decision making. The PPG clarifies that being able to properly assess the nature, extent and the importance of the significance of the heritage asset and the contribution of its setting, is very important to understanding the potential impact and acceptability of development proposals (paragraph 008 Reference ID: 18a-008-20190723).

2.2.6 The PPG states that in relation to setting, a thorough assessment of the impact on setting needs to take in to account, and be proportionate to, the significance of the heritage asset under consideration and the degree to which proposed changes enhance or detract from that significance and the ability to appreciate it (paragraph 009 Reference ID: 18a-009-20190723).

2.2.7 The extent and importance of setting is often expressed by reference to visual considerations. Although views of or from an asset will play an important part, the way in which an asset is experienced in its setting is also influenced by other environmental factors such as noise, dust and vibration from other land uses in the vicinity, and by our understanding of the historic relationship between places.

2.2.8 Paragraph 013 of the PPG recognises that the contribution that setting makes to the significance of the heritage asset does not depend on there being public right or the ability to experience that setting. When assessing any application for development which may affect the setting of a heritage asset, local planning authorities may also need to consider the implications of cumulative change (Paragraph: 013 Reference ID: 18a-013-20190723 Revision date: 23 07 2019).

2.2.9 In relation to substantial harm, the PPG states that *'it is the degree of harm to the asset's significance rather than the scale of the development that is to be assessed'* (paragraph 017). Harm to heritage assets can be avoided or minimised if proposals are based on a clear understanding of the heritage asset and its setting (paragraph 008 Reference ID: 18a-008-20190723). The NPPF indicates that the degree of harm should be considered alongside any public benefits that can be delivered by development.

2.3 Local planning policy

2.3.1 Local planning policy for Oldham is provided by the Joint Core Strategy and Development Management Policies of the Oldham Local Development Framework, adopted in November 2011 (Oldham Council, 2011), and a small number of retained policies from the Unitary Development Plan (Oldham Council, 2009).

2.3.2 Policy 24 relates to the Historic Environment and is reproduced in full below:

Policy 24 Historic Environment

'Oldham has a rich historic environment with many significant and valuable features, structures and characteristics. The council will protect, conserve and enhance these heritage assets and their settings which adds to the borough's sense of place and identity.

Development proposals must have regard to:

National and local guidance and policies on the historic environment.

Oldham Rochdale Housing Market Renewal Pathfinder Heritage Assessments.

Greater Manchester and Oldham Urban Historic Landscape Characterisation Study.

Conservation Area Appraisals and Management Plans, where appropriate.

When allocating sites and determining applications for planning and advertisement consents, the council will seek to protect, conserve and enhance the architectural features, structures, settings, historic character and significance of the borough's heritage assets and designations including:

Listed buildings.

Conservation areas.

Registered parks and gardens (their historic character and setting).

Scheduled ancient monuments (their archaeological value and interest).

Significant archaeological remains.

Locally significant buildings, structures, areas or landscapes of architectural or historic interest (including non-designated locally significant assets identified in the local lists compiled by the council).

The council will support heritage-led regeneration, including the reuse of historic buildings such as mills, to achieve economic, community and regeneration objectives, where appropriate.

Listed Buildings

Development to, or within the curtilage or vicinity of, a listed building or structure must serve to preserve or enhance its special interest and its setting. There will be a strong presumption against proposals involving the demolition of listed buildings or structures. Proposals which would lead to the loss or cause harm to grade I and II listed buildings should be wholly exceptional. Development proposals for a building incorporating a historic shop front should make provision for its retention, restoration and repair.*

Conservation Areas

Development within or affecting the setting of a conservation area, including views in or out, must serve to preserve or enhance the character or appearance of the area. Proposals for all new development, including alterations and extensions to buildings and their re-use, must have a sensitive and appropriate response to context and good attention to detail. Proposals must not adversely affect important architectural or historic features or distinctive local features or structures unless it can be demonstrated that the development brings substantial benefits to the community. Proposals for the demolition of a building in a conservation area must demonstrate that it is unrealistic for the building to continue in its

existing use and a suitable alternative use cannot be found, or the building is in poor structural condition and the cost of repairing and maintaining it would be disproportionate to its importance and value and the demolition would preserve or enhance the character or appearance of the conservation area. In exceptional circumstances, the fact that a demolition would bring substantial benefits to the local community may outweigh the balance in favour of the preservation of the building.

Registered Parks and Gardens

Development which would lead to the loss of, or cause harm to, the historic character or setting of any part of registered park and garden will not be permitted.

Scheduled Monuments

Development which would lead to the loss of, or cause harm to, scheduled ancient monuments should be wholly exceptional.

Local Designations

Development which would affect the following designations will only be permitted in cases where it can be demonstrated that the benefits of the development brings substantial benefits to the community which outweigh the preservation of the heritage asset:

Significant archaeological remains.

Locally significant buildings, structures, areas or landscapes of architectural or historic interest'.

Places for Everyone (Greater Manchester Combined Authority 2024)

2.3.3 Places for Everyone (Greater Manchester Combined Authority 2024) is a joint development plan covering nine Greater Manchester districts including Oldham, setting out a framework for sustainable development. Policy JP-P2 concerns Heritage and is of relevance to this assessment:

Policy JP-P2: Heritage

We will proactively manage and work with partners to positively conserve, sustain and enhance our historic environment and heritage assets and their settings. Opportunities will be pursued to aid the promotion, enjoyment, understanding and interpretation of heritage assets, as a means of maximising wider public benefits and reinforcing Greater Manchester's distinct character, identity and sense of place.

Local Plans will set out the key elements which contribute to the district's identity, character and distinctiveness and which should be the priority for conserving and enhancing in the future and demonstrate a clear understanding of the historic environment and the heritage values of sites, buildings or areas and their relationship with their surroundings. This knowledge should be used to inform the positive management and integration of our heritage by:

1. *Setting out a clear vision that recognises and embeds the role of heritage in place-making;*

2. *Ensuring that the heritage significance of a site or area is considered in accordance with national planning policy in the planning and design process and opportunities for interpretation and local engagement are optimised;*

3. *Integrating the conservation and enhancement of heritage assets and their settings, with creative contextual architectural responses that contribute to their significance and sense of place;*

4. *Delivering positive benefits that sustain and enhance the historic environment, as well as contributing to the economic viability, accessibility and environmental quality of a place, and to social wellbeing; and*

5. *Exploring opportunities to reduce greenhouse gas emissions that restoration of historic buildings offer.*

Particular consideration will be given to ensure that the significance of key elements of the historic environment which contribute to Greater Manchester's distinctive identity and sense of place are protected from harm. These include historic town centres, places of worship, historic transport routes including the canal network, industrial buildings and structures including textile mills, farmsteads and other sites, buildings, and areas of identified archaeological, architectural, artistic and/or historic value. Development proposals affecting designated and non-designated heritage assets and/or their settings will be considered having regard to national planning policy. Where heritage assets have been identified as being at risk, Local Plans should identify specific opportunities for them to contribute to regeneration and place-making, and they should set out strategies for their repair and re-use. Development proposals which will help safeguard the significance of and secure a sustainable future for Greater Manchester's heritage at risk will be supported in principle, provided they are not contrary to national policy or other policies in the development plan. Proposals should be informed, as necessary, by the findings and recommendations of the appropriate

heritage assessment(s) in the development plan evidence base and/or any updated heritage assessment submitted as part of the planning application process.

Historic England Guidance

2.3.4 Historic England has published a series of Good Practice Advice (GPA) notes and Advice Notes (AN) of which those of most relevance to this appraisal are GPA2 – Managing Significance in Decision-taking (Historic England, 2015), GPA3 – The Setting of Heritage Assets (Historic England, 2017), and AN12, Statements of Heritage Significance (Historic England, 2019).

2.3.5 GPA2 – Managing Significance in Decision-taking emphasises the importance of having a knowledge and understanding of the significance of heritage assets likely to be affected by the development and that the *'first step for all applicants is to understand the significance of any affected heritage asset and, if relevant the contribution of its setting to its significance'* (paragraph 4). Early knowledge of this information is also useful to a local planning authority in pre-application engagement with an applicant and ultimately in decision making (paragraph 7).

2.3.6 GPA3 – The Setting of Heritage Assets provides advice on the setting of heritage assets. Setting is as defined in the NPPF and comprises the surroundings in which a heritage asset is experienced. Elements of a setting can make positive or negative contributions to the significance of an asset and affect the ways in which it is experienced. Historic England state that setting does not have a boundary and what comprises an asset's setting may change as the asset and its surrounding evolve. Setting can be extensive and particularly in urban areas or extensive landscapes can overlap with other assets. The contribution of setting to the significance of an asset is often expressed by reference to views and the GPA in paragraph 11 identifies those views, such as those that were designed or those that were intended, that contribute to understanding the significance of assets.

2.3.7 AN12, Statements of Heritage Significance outlines a recommended approach to assessing the significance of heritage assets in line with the requirements of NPPF. It includes a suggested reporting structure for a 'Statement of Heritage Significance', as well as guidance on creating a statement that is proportionate to the asset's significance and the potential degree of impact of a proposed development. The AN also offers an interpretation of the various forms of heritage interest that an asset can possess, based on the terms provided in the NPPF Glossary (Annex 2); namely archaeological, architectural, artistic, and historic.

3. ASSESSMENT METHODOLOGY

3.1 Research

3.1.1 In accordance with Historic England guidance and as determined by policy requirements, this assessment identifies the baseline heritage interest of Oldham Road Overbridge (MVL3/28). The historical narrative informing the baseline has been derived from a review of various resources including maps and other cartographic and photographic sources. Statutory information in relation to designated assets has been obtained from the National Heritage List for England maintained by Historic England and the Historic Environment Record maintained by Greater Manchester Archaeology Advisory Service.

3.1.2 Additional information concerning the assets, their condition, use and setting has been obtained from a walkover survey undertaken by suitably qualified and experienced heritage specialists on 21 and 22 May 2024, including observation from surrounding vantage points and informed by appraisal and observation derived from close working with other disciplines within the project team.

3.2 Significance and setting

3.2.1 Assessment of the significance of heritage assets and their setting has been undertaken in consideration of guidance issued by Historic England. A methodology for the assessment of significance of heritage assets is outlined in Advice Note 12 (Historic England, 2019) whilst Historic England GPA3 (Historic England, 2017) provides the basis of a methodology for the assessment of setting.

3.2.2 Significance is often established by statutory designations such as listed buildings, scheduled monuments and conservation areas. More particular advice as to what makes up significance is set out in AN12, which establishes a method for thinking consistently about the heritage values that can be ascribed to a place. When making an assessment of significance, numerous aspects are considered including architectural interest, historic interest, group value, social value, former uses and local distinctiveness. These aspects are grouped into four values defined in the NPPF as historical interest, archaeological interest, artistic interest, and architectural interest.

3.2.3 In assessing whether the setting of an asset contributes to its significance, and in assessing the effect of development, Historic England GPA3 provides a checklist of attributes that may affect setting and significance under five broad categories comprising:

- The location and siting of the development;
- The form and appearance of the development;

- Additional effects (change to skyline etc.);
- Permanence; and
- Consequential effects.

4. CONSULTATION

4.1.1 Historic England and Oldham Metropolitan Borough Council (OMBC) have been involved in ongoing stakeholder consultation with Network Rail through the development of Route Section W2B of the TRU.

4.1.2 Regular meetings with both these historic environment stakeholders have been held to discuss design development of the proposals in relations to Oldham Road Overbridge (MVL3/28). Initial meetings were held periodically throughout 2021 and resumed in 2024 to discuss the overall route and design development for all listed structures within Route Section W2B.

4.1.3 The design development for Oldham Road Overbridge (MVL3/28) was discussed during meetings with the statutory stakeholders on the dates outlined in Table 4-1.

Table 4-1 Consultations for Oldham Road Overbridge (MVL3/28)

Date	Stakeholder in attendance	Key agreements/items discussed
16 February 2021	• OMBC • Historic England	• An overview of Oldham Road Overbridge's (MVL3/28) significance was presented. • The challenge of electrification at this location was presented, with the problem of clashing electrification and gauge clearances outlined. • A summary of the two key high-level options being considered was presented, namely track lowering and bridge reconstruction (with the potential scope to widen the bridge to improve highway layout). • OMBC queried whether bridge reconstruction could also include pedestrian provision across the bridge which is currently poor. • Detailed discussion took place regarding the options for improving the layout of the highway, including widening of the bridge and signalising Shaw Hall Bank Road junction to remove conflicts. Potential diversionary routes during construction works were also discussed, with feedback gathered from OMBC regarding road closures and the management of highway disruption.

Date	Stakeholder in attendance	Key agreements/items discussed
		• At this time OMBC were without a Conservation Officer, with Historic England recognising this gap in resource and agreeing to continue to engage and provide pre-application feedback.
26 May 2021	• Historic England • OMBC • Kirklees Council	• Overview of the structures along Route Section W2B which are of historic interest, including the grade II overbridges and underbridges which are noted for their inherent significance, particularly as essential railway structures. Acknowledgement of their group value with each other was also presented as a key contributor to significance. • Presentation of the purpose of Heritage Statements and their assessment of impact with the emerging GRIP 3 designs.[1] • Early-stage recommendations to minimise harm to significance against the requirements for justification of proposals and opportunities to pursue sensitive design and compensation. The high likelihood of MVL3/28 being reconstructed was presented, due to the potential level of impact this structure was flagged as red on a RAG scale. • Reassurance was provided to the council that they will be involved in the GRIP 3 design process which will be used within the detailed design development of GRIP 4. Clarification was also provided on the sustainable heritage initiatives. • Historic England stated that they expect to get an understanding of significance at this stage and that they anticipate options to be shared for comment. Also stressed the importance of minimising harm.
6 February 2024	• Historic England	• Details of the challenges of the electrification of the route in relation to listed overbridges were presented. Design measures under consideration for addressing these challenges noted to include: Reduced voltage clearances: o Development of scheme-specific pantograph, reducing electrical clearances to a minimum. o Site specific risk assessments of bridges due to reduced overhead wire heights.

[1] At the time of consultation in 2021, the delivery of railway investment programmes was managed by Network Rail as a staged process through use of the GRIP (Governance for Railway Investment Projects) process. GRIP 3 comprised option selection and GRIP 4 single option development. This has since been replaced by PACE (Project Acceleration in a Controlled Environment).

Date	Stakeholder in attendance	Key agreements/items discussed
		Electrical protection works: ○ Risk-based approach to raising parapets. Where safe to do so, 1.5 m height parapets may be employed, rather than standard 1.8 m height. ○ This approach has been embedded in designs for Route Section W2B. • The design approach for electrification across / under existing railway bridges was noted to have agreed in principle by Network Rail and following consultation with the Local Authorities & Historic England at the preceding design stage. • The approach to bridge reconstruction was outlined, with key design aspects discussed including: ○ Visibility of new concrete elements to be minimised through the use of masonry cladding; ○ Reclaimed stone used to clad interior of parapet, natural stone used to clad exterior; ○ Coursing of cladding to tie in with existing stonework as far as reasonably practicable; and ○ Where reclaimed stone cannot be reused, natural stone of matching size and colour will be used. • Confirmation that the design optioneering will be undertaken in consultation with Historic England.
22 February 2024	• OMBC	• The challenge of electrification at this location was presented, with the problem of clashing electrification and gauge clearances outlined. • A summary of the two key high-level options being considered was presented, namely track lowering and bridge reconstruction (with the potential scope to widen the bridge to improve highway layout). The opportunity for OMBC to introduce traffic lights into both of the presented options was also highlighted. • Network Rail confirmed that both options would be developed in parallel to enable the robust exploration of their advantages and disadvantages. • OMBC recognised the overall impact of the proposed works on the safety of highway users would be positive once completed. However, the key importance of minimising disruption during the construction phase was underlined.

Date	Stakeholder in attendance	Key agreements/items discussed
5 March 2024	• Historic England	• The significance, site constraints and optioneering process for Oldham Road Overbridge (MVL3/28) were presented to Historic England. • Two key options for bridge reconstruction that achieve higher standards for highway safety were presented. The options comprised: the widening of the deck on the south side, and the construction of a separate footbridge. Further consultation with the Local Highway Authority was needed to agree the optimal arrangement. • Agreement that the detailing of any reconstruction would align with the general approach taken for other proposed reconstructions on Route Section W2B. • Network Rail's preferred option for a bridge reconstruction was recognised by Historic England along with the constraints relating to the other presented options.
22 March 2024	• OMBC	• Presentation of site constraints and optioneering for Oldham Road Overbridge (MVL3/28) to the council. • Presentation of the two options being considered for Oldham Road Overbridge (MVL3/28): o Option 2a: propose widening the bridge and increase width deck. This option is not recommended by the TRU team given that the gradient would be worse than it currently is. o Option 2b: removing footway off the bridge. This option would improve the gradient of the ramp Both options would be considered to be a local improvement. • During this meeting, the Council identified Option 2B as their preferred approach.
9 April 2024	• Historic England	• Presentation of proposal for Oldham Road Overbridge (MVL3/28) for an enhanced reconstruction.
7 May 2024	• Historic England	• Agreement in principle with Historic England on the principle of reconstruction at Oldham Road Overbridge (MVL3/28)
22 May 2024	• OMBC	• Presentation of progression of optioneering for Oldham Road Overbridge (MVL3/28), in particular Option 2B which was previously deemed to be the preferred approach. Presentation of advantages and disadvantages of progressing with Option 2b, and

Date	Stakeholder in attendance	Key agreements/items discussed
		confirmation that it is now the preferred Option for TRU.
26 June 2024	• OMBC	• Presentation of update on Oldham Road Overbridge (MVL3/28) with 3D visualisations. Confirmation that the proposals are viable and that the overbridge would be built within the same footbridge as the existing footbridge. • The materiality used for the proposals would include: o A prestressed concrete box beam; o Stone clad parapets (on both sides); o Coloured concrete copers; and o Stone clad approach parapets (on both sides). • Confirmation that the designs will seek to minimise the visible coloured concrete at the base of the parapets, high stone walls
25 June 2024	• Historic England	• Pre-application advice letter from Historic England identifies that the reconstruction of MVL3/28 would result in substantial harm to the significance of the bridge (Appendix C.1). • Historic England summarised that substantial harm would arise from the loss of the form of the arched bridges and through the loss of historic fabric, with additional harm identified to the group value of the bridges. • It was agreed that reclaimed stone should be focussed on the inside faces of the parapet to minimise the degree to which the alteration of the bridge is experienced from the deck. • Historic England concluded that it will be for the decision taker to weigh the balance of the identified substantial harm against the public benefit of the scheme.
2 July 2024	• Historic England	• An update on the developing design for Oldham Road Overbridge (MVL3/28) was presented to Historic England. The selection of the separate footbridge as the single preferred option was confirmed. • Details regarding the proposed materials and progress with modelling the proposed designs were shared. Materials presented included: Overbridge o Prestressed concrete beams for the overbridge deck;

Date	Stakeholder in attendance	Key agreements/items discussed
		○ Stone clad parapet units; and ○ Coloured concrete copers. Footbridge ○ Steel composite bridge deck; and ○ Stone clad parapet units. Ramps ○ Utilising existing stone walls where possible; ○ No steel or concrete superstructures; and ○ Handrails on approach. • Details were also shared regarding the proposed improvements to highway visibility and gradients of the proposed ramps and footbridge.
06 November 2024	• Historic England	• This meeting was used to present the draft listed building consent drawings to Historic England and to discuss the proposals presented in the drawings. • It was noted that the drawings show the maximum extent of demolition expected at this structure, with the extent of demolition sought to be minimised wherever possible should the proposed work be implemented. • Historic England stated that the proposals would result in the loss of the majority of the bridge's significance, while also recognising the benefits afforded by the proposed works. It was also underlined that permanent public interpretation would contribute as a mitigating measure balancing against the high level of harm. • Due to the degree of harm arising from the proposals, discussion took place regarding the potential for de-listing the structure should the proposed works be implemented, this would be considered further in future. • Brief discussion regarding the scope of the forthcoming application for listed building consent took place, with the question of whether the proposed Oldham Road Footbridge (MVL3/27B) should form part of the application raised. It was concluded that the query would best be resolved by OMBC.
29 November 2024	• Historic England	• In their pre-application advice letter Historic England confirmed demolition and reconstruction of Oldham Road Overbridge (MVL3/28) would result in substantial harm to the significance of the bridge arising from the severity of changes to its physical

Date	Stakeholder in attendance	Key agreements/items discussed
		appearance and the loss of historic fabric ((Appendix C.2). • Historic England highlighted that the detailing of stone cladding would need to be carefully managed to maintain the look of the structure, with care taken to replicate the effect of stone coursing running through the parapets into the wing walls. Mismatched coursing in separate panels could result in a disjointed new structure which should be avoided. • It was requested that the possibility of articulating the existing pilasters in the design of the new bridge be fully investigated. • The suitability of the location to display permanent interpretation materials to mitigate some of the harm arising from the works was also highlighted.
04 December 2024	• Historic England	• Following receipt of Historic England's pre-application advice letter on 29th November 2024, a meeting was arranged to discuss the detailing of the stone clad riser units and the degree to which the pilasters could be articulated in the proposed design. • Network Rail confirmed that the stone-clad riser would be detailed to reference the existing pilasters below deck level, with pilaster features projecting from the wingwall creating a comparable visual effect as the existing pilasters. The geometry of each of the pilaster features would differ due to the alignment of the structure. The articulation cannot be continued up to parapet height due to the requirement to maintain a gap between the riser unit and abutment, as well as potential difficulties in achieving the stringent requirements for vehicle containment if the parapet were to differ in thickness along its length (which would result from the pilaster feature stepping out).
2 April 2025	• OMBC	• Presentation of overview of the aims and objectives of TRU to OMBC heritage officers, with emphasis on the historic context of Route Section W2B and the 12 listed building consents applications which are being prepared for the various works to the grade II listed bridges and viaduct along the route section. • Network Rail requested for the draft Heritage Statement to be reviewed by the Council for comment and feedback. • Presentation of overview of electrification challenges caused by the existing arch profile of a number of

Date	Stakeholder in attendance	Key agreements/items discussed
		existing bridges and have developed bespoke solutions for these to achieve the required clearance. • Overview of the current status of each structure within OMBC's jurisdiction, including the reconstruction of Oldham Road Overbridge (MVL3/28). Network Rail noted that the existing structure is very low and a significant track lowering would be needed however its proximity to the station makes this unfeasible. Reconstruction was progressed as the preferred option which would also take into account the highway safety concerns and traffic issues previously raised by OMBC. The proposed new footbridge would also result in significant improvement to the public.
4 April 2025	• Historic England	• Overview of draft comments from Historic England. Request to draw out the heritage interpretation in the reports as part of the heritage benefits. • Historic England were content with the assessment of significance for all structures, and noted that the optioneering tables were helpful. Historic England requestion for further details on the heritage interpretation as part of the heritage benefits.
12 May 2025	• OMBC	• Presentation of proposals for Oldham Road Overbridge (MVL3/28) to OMBC heritage officers. • Significance and status of the existing station footbridge queried by OMBC. The structure was noted to have been partially reconstructed, altered and relocated to its current position from another railway line. The footbridge was noted to have been excluded from the NHLE listing for Oldham Road Bridge (MVL3/28). • Draft listed building consent conditions discussed including specification of finish for railings.
24 June 2025	• OMBC	• Pre-application advice letter received from OMBC outlining local planning authority advice following review of the draft listed building consent application material. • OMBC found that the reconstruction of Oldham Road Overbridge (MVL3/28) would result in substantial harm through the loss of its historic form and much of the original fabric. • OMBC highlight that clear and convincing justification will be required for any harm arising to designated heritage assets, with substantial benefits required to outweigh substantial harm.

Date	Stakeholder in attendance	Key agreements/items discussed
		• A high level of harm was also found to the group value of the bridges designed by A.S Jee on the TransPennine Route, due to the proposed demolition of Wright's Overbridge (MVL3/23) and reconstruction of four other bridges (including Oldham Road Overbridge (MVL3/28) and a limited level of harm to group value arising from the alteration of three other structures.
18 July 2025	• Historic England	• Pre-application advice letter received from Historic England providing overarching feedback on proposals affecting listed bridges between Stalybridge and Standedge Tunnel (see Appendix C). • Acknowledgment given to the collaborative approach taken at pre-application stage, to fully explore alternative options to reconstruction and for the opportunity for Historic England to feed into design plans. • The heritage statements adjudged to be well considered with clear justification having been provided for the substantial harm identified to those structures proposed for removal or reconstruction. • The inclusion of interpretation at Greenfield Station is welcomed by Historic England.

5. HERITAGE ASSETS AND THEIR SIGNIFICANCE

5.1 History of the W2B Transpennine Route

5.1.1 The railway connecting Stalybridge to Huddersfield, which runs under Oldham Road Overbridge (MVL3/28) was constructed by the Huddersfield & Manchester Railway Company between 1846 and 1849. The mid-1840s was a period of commercial confidence and massive expansion in the railway network across England, known as 'Railway Mania' which has been described by Historic England as the Heroic Age of railway building (Historic England, 2017). Between 1845 and 1852 the railway network expanded from 2,345 miles to 7,272 miles (3774 km to 11,703 km) (Alan Baxter Associates, 2019). Constructed at the height of this boom, the Stalybridge to Leeds line was a product of this trend. Traversing a challenging landscape through the Pennines, the line was planned to follow the route of the Huddersfield Narrow Canal for much of its length, with the canal acquired by the Railway Company the year after the railway line's authorisation (Alan Baxter Associates, 2019). These difficult

landscape conditions resulted in the need to build several major viaducts and tunnels. These included the Standedge Tunnel through the Pennines, which was constructed alongside the 1811 canal tunnel and is '*indisputably significant as a major engineering achievement'* (Alan Baxter Associates, 2024).

5.1.2 The development and expansion of the railways during the 19th century transformed the landscape and settlements through which they passed, fuelling industrial growth and settlement expansion. The impact of improved communications, first with the arrival of the canal in 1811, and then the railway in 1849, provided valuable links with Huddersfield, Manchester and Leeds, enabling import of raw materials and export of manufactured goods. This fuelled the gradual industrialisation and settlement expansion along the Tame Valley. This can be seen on historic Ordnance Survey maps dating from the 19th and early 20th century where industrial development including mills, dyeworks, printworks and quarries, is shown to have been present along the route of the railway and extending into the more upland areas around Saddleworth and Harrop Dale, whilst settlements such as Mossley and Dobcross gradually expanded.

5.1.3 Oldham Road Overbridge (MVL3/28) was constructed for the Huddersfield & Manchester Railway Company in the mid to late 1840s. The principal engineer for the Huddersfield & Manchester Railway was Alfred Stanistreet (A. S.) Jee (1816–1858), who was assisted by the more renowned engineer Joseph Locke (1805–1860). Jee's work on the Huddersfield & Manchester Railway represents, arguably, his greatest achievement. This can be seen particularly in the construction of the Standedge Tunnel, which at over three miles long was one of the longest and most difficult in England, but also through the various large-scale viaducts along the route. In the 1850s, he worked internationally on the Spanish line from Alar-del-Rey to Reynosa where his skill in design, his accuracy and his completeness of the details earned him high praise (Institution of Civil Engineers: Obituaries, 1859). He died in a fatal accident upon the opening of the second portion of that line.

5.1.4 In 1847, prior to the opening of the line, the Huddersfield & Manchester Railway Company was taken over by the London and North Western Railway (LNWR). As part of the LNWR network, the Huddersfield & Manchester Railway formed part of a direct route from Manchester to the West Riding, enabling the LNWR to access the textile and coal industries of West Yorkshire. By 1851, the LNWR was the most prominent railway company of the period, with over 800 miles of track and was the largest joint-stock concern of its time, capitalised at £29 million. The line was acquired by the London Midland and Scottish Railway in 1923, before being nationalised in 1948.

5.1.5 Whilst other parts of the Transpennine route were subject to significant alterations, the Huddersfield & Manchester Railway between Standedge Tunnel and Stalybridge was subject to relatively limited alteration. The Micklehurst Loop was constructed from 1881-85 to provide additional capacity, and diverged from the existing railway to the east of the Tame Vally, avoiding physical interaction with the majority of its alignment. A new junction to the south of Greenfield Station is shown on historic maps from the early 20th century as additional tracks toward Oldham were established from this station. However similarly to the Micklehurst loop, the additional lines diverged from the main Huddersfield line, running westwards at its intersection with Shaw Hall Bank Road Footway (MVL3/26). The railway was also widened to the east of Diggle to accommodate additional tracks serving new bores for the Standedge Tunnel which were added in 1868-71 and 1894, necessitating widening of bridges to the east of the route.

5.1.6 Piecemeal change has occurred on the Huddersfield & Manchester Railway, most notably with the closure of a small number of stations along the route, such as Diggle and Saddleworth Stations. The route today forms part of the wider Transpennine route between York, Selby and Manchester, which comprises sections of rail line developed by different railway companies.

5.1.7 The history and significance of the Transpennine route is discussed at more length in the Route-Wide Statement of Significance (Alan Baxter Associates, 2019). This was produced to characterise the overall heritage significance of the Transpennine route as a whole.

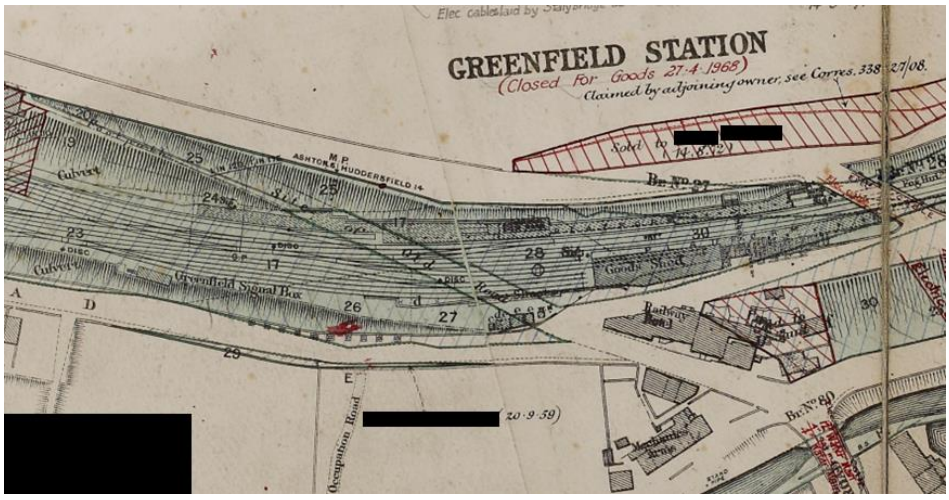
5.2 Oldham Road Overbridge (MVL3/28)

History

5.2.1 Oldham Road Overbridge (MVL3/28) was constructed between 1845 and 1849 during the Heroic Age of railway building. The single-span bridge was designed by A.S. Jee for the Huddersfield & Manchester Railway and is situated adjacent to Greenfield Station to the west of the village of Greenfield.

5.2.2 Oldham Road Overbridge (MVL3/28) was constructed between 1845 and 1849 to the design of A. S. Jee for the Huddersfield and Manchester Railway. The overbridge was constructed to carry the existing Standedge and Oldham Turnpike Road (now the A670) across the cutting for the Huddersfield & Manchester Railway. Constructed in the late 18th century, the turnpike road provided a valuable communication route into the Pennine hills, linking the more remote upland areas with growing industrialised centres such as Oldham, fuelling growth, and settlement and industrial expansion.

The historic line plans held by Network Rail depict the original course of Oldham Road prior to the construction of the railway, with its course being re-routed to the north via the newly constructed overbridge (see Insert 5-1). The construction of Oldham Road Overbridge (MVL3/28) to maintain this route reflects the importance of this route to communications through the Tame Valley. This was reinforced in 1851 with the opening of the Oldham Branch Line by LNWR, which provided connections with Delph and Oldham to the west.



Insert 5-1 Historic line plan held by Network Rail which depicts the course of Oldham Road prior to the construction of the railway

5.2.3 Oldham Road Overbridge (MVL3/28) is constructed on a skew across the railway track. Skew bridges represent a particular challenge in engineering terms and had been increasingly employed from the late 18th century by canal engineers to overcome the difficulties of canal crossings which were not perpendicular. Early uses on the railway included bridges by George Stephenson on the Liverpool and Manchester Railway (1828–1830) and James Walker on the Leeds and Selby Railway (1830–1834). Jee's use of skew arches on the Huddersfield & Manchester Railway represented a continuation of this practice and provided an elegant solution to the challenges of the constrained route through the Pennines.

5.2.4 The 1st edition six-inch Ordnance Survey Map of 1854 (Insert 5-2) depicts the bridge five years after the opening of the Huddersfield & Manchester Railway. Oldham Road Overbridge (MVL3/28) is shown directly to the north of the buildings of Greenfield Station, and labelled as Frenches Top Bridge reflecting its location close to the hamlet of Frenches and Frenches Mill. The railway is shown as running in cutting at the base of a steep hill, adjacent to the Huddersfield Narrow Canal and River Tame, with enclosed fields present on the flatter land to the east of the River Tame, and plantation on the steep slopes of Wharmton to the north-west. The

1st edition map reveals development around the bridge to have been dispersed and predominantly residential or agricultural. A single mill is depicted between the canal and river comprising Frenches Mill which is annotated as a bone, dye and wood mill.

Insert 5-2 1st edition Ordnance Survey County Series Map 1854

5.2.5 By the time of the second edition six-inch Ordnance Survey map of 1891 (Insert 5-3), the setting of Oldham Road Overbridge (MVL3/28) is shown to have undergone further development. The large-scale complex of Wellington Mills is depicted to the east of the River Tame, whilst Frenches Mill has expanded to become Frenches Dye Works. Workers' housing is also depicted along Chew Valley Road and Shaw Hall Bank Road to serve the growing mill and dye works. This growth of development around Oldham Road Overbridge (MVL3/28) was enabled by the good communication links which Greenfield enjoyed, being served by road, canal and railway. Further expansion of settlement and industry in the area around Oldham Road Overbridge (MVL3/28) is shown on subsequent map editions through the 20th century.

Insert 5-3 County Series Map 1891

Description

5.2.6 Oldham Road Overbridge (MVL3/28) comprises single segmental arched skew overbridge located directly to the north of Greenfield Station (Insert 5-4 and Insert 5-5). Constructed to carry Oldham Road (the A670) over the railway, which is aligned north-east to south-west and set within a cutting at this location. Three-way junctions are present to either end of the bridge with sharp bends in all directions. A 40 mile per hour speed limit is present along this stretch of road.

5.2.7 The overbridge is constructed in regular-coursed, rock-faced ashlar sandstone and is formed by a segmental arch flanked by battered piers and wing walls. The arch springs from an ashlar impost band and is detailed with stepped voussoirs and taller keystones, in picked ashlar with tooled margins. The bridge soffit is constructed of skew-coursed, rock-faced stone blocks. A stringcourse runs across the bridge formed by two square-moulded bands, extending across the arch and over the flanking piers. A plain parapet runs above with ashlar coping over. The wing walls continue around into the flanking roads, with a blocked opening present in the parapet to the south-west which formerly gave access to a staircase to platform level (now removed). Repeated vehicle strikes on Oldham Road have resulted in damage to the parapet and its repeated rebuilding (Insert 5-6). Palisade fencing and a steel barrier are present at the end of the bridge adjacent to Shaw Hall Bank Road, and very narrow footways run to either side of the structure.

Insert 5-4 Oldham Road Overbridge (MVL3/28) north-east elevation

Insert 5-5 Oldham Road Overbridge (MVL3/28) south-west elevation from Greenfield Station.

5.2.8 Oldham Road Overbridge (MVL3/28) is a prominent feature in its setting which is somewhat localised given the nature of its surrounding environment. Due to the steep topographical nature of the area and intervening vegetation and embankment walls, the elevations of the road bridge can only be appreciated from the station platforms to its southwest (Insert 5-5). Its relationship with and proximity to Greenfield Station is a key element of its setting which evidences its relationship with the operational Transpennine Railway. Views from the bridge deck looking north and south also enable for an appreciation of its relationship with the Transpennine Railway (for example see Insert 5-7). A cast iron footbridge (MVL3/27A) dating to c. 1900 and station platforms located directly to the west provide key vantage points to appreciate the road bridge. Given that the current Greenfield Station is of modern construction, it is not of historic interest and forms a neutral element in its setting.

Insert 5-6 Oldham Road Bridge (MVL3/28), bridge deck and evidence of vehicle strike.

Insert 5-7 Oldham Road Bridge (MVL3/28), looking south-west overlooking the railway alignment. Greenfield Station Footbridge (MVL3/27A) is visible

Significance

5.2.9 Oldham Road Overbridge (MVL3/28) was designated as a grade II listed building in March 2018. The Historic England List Entry description identifies the bridge to be of special interest due to the following principle reasons:

- Historic interest:
    - Constructed during the heroic age of railway building and a little altered example of an 1840s overbridge on what is now one of the main railway lines in northern England.
    - Designed by the notable railway engineer Alfred Stanistreet Jee.
- Architectural interest:
    - As a well-designed and crafted stone bridge with attention to architectural detail in the use of a skew-coursed soffit, stepped, picked and tooled ashlar voussoirs with v-joints, ashlar impost band and coping and contrasting rock-faced spandrels, parapets, piers and wing walls, all lifting it above the purely functional.
- Group value:
    - Architecturally inter-related with the other listed structures designed by A S Jee on the Huddersfield & Manchester line.

5.2.10 The construction of Oldham Road Overbridge (MVL3/28) between 1845 and 1849 places it within the Heroic Age (1841–50) of railway development and links it to the period of 'railway mania' which marked a time of commercial confidence and expansion in the railways. The bridge's direct historic relationship with historic railway companies of the period, comprising the Huddersfield & Manchester Railway and LNWR, and the notable railway engineer A. S. Jee, who also designed similar structures along the route (see 5.2.13 below), give the structure historical value from which it derives significance. The bridge remains in use as a part of the operational railway network and, together with surviving contemporary structures, evidences the historic infrastructure of the Huddersfield & Manchester Railway.

5.2.11 The bridge derives significance from the quality of its architecture and construction, a characteristic feature of Jee's work for the Huddersfield & Manchester Railway. The bridge's considered architectural features include its overall skewed form, stepped, rusticated, ashlar voussoirs with a slightly projecting keystone,

tooled margins, and ashlar impost bands. These features, as well as the quality of their execution, raise the architectural value of the bridge beyond the purely functional. The skew arch is well detailed and constructed, evidencing Jee's mastery of the setting out and construction of skew arches, and providing an elegant solution to the challenges presented by the combination of road and railway alignment at this site. The bridge survives in largely unaltered form and with the exception of repairs to the parapet, no evidence of significant intervention or alteration. The historic integrity of the structure enables Jee's original design intent and the historic function of the structure to be understood, contributing to its significance. As a surviving and component feature along the wider railway network, its design contributes to the legibility of the Huddersfield & Manchester Railway in the contemporary landscape.

5.2.12 The setting of Oldham Road Overbridge (MVL3/28) makes a minor contribution to its overall significance. Its relationship with the railway is a key component of its setting given that the bridge continues to span the railway cutting and evidences its close physical, functional and historic relationship with the railway. Its proximity to Greenfield Station, albeit a station of modern construction, enhances this relationship and provides key views from the station platform and station footbridge. This relationship is also visible from the bridge deck looking north and south. The presence of the existing footbridge (MVL3/27A) and its relationship to Oldham Road Overbridge (MVL3/28), whilst providing visual interest, results from the relocation of the footbridge from another station in the late 20th century and does not reflect the historic setting of the overbridge. Though its wider setting has undergone some change and development, this does not impact on the ability to appreciate its overall significance, nor does it impact on its relationship with the railway.

Group value

5.2.13 As identified in the list description, Oldham Road Overbridge (MVL3/28) is recognised to be of group value with other designated structures designed by A.S. Jee on the Huddersfield & Manchester Railway[2]. These comprise:

- Heyrod Hall Overbridge (MVL3/7) (grade II listed, NHLE 1449242);

[2] Wheatley's Overbridge (MVL3/103) (grade II listed NHLE 1450537) was designed by A.S. Jee for the Huddersfield & Manchester Railway. The Overbridge was granted consent for extensive change as part of the Huddersfield to Westtown (Dewsbury) Order section of the Transpennine Route Upgrade, and will be demolished and replaced with a new structure (ref 2021/91337). This is likely to result in de-listing. As such its contribution to group value has therefore been excluded from this assessment..

- Springbank Lane Footbridge (MVL3/8) (grade II listed, NHLE 1452382);
- Springbank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (grade II listed, NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405);
- Wright's Mill Overbridge (MVL3/20) (grade II listed, NHLE 1452406);
- Wright's Overbridge (MVL3/23) (grade II listed, NHLE 1452409);
- Royal George Underbridge (MVL3/25) (grade II listed, NHLE1451848);
- Shaw Hall Bank Road Footway (MVL3/26) (grade II listed, NHLE 1451852);
- Wickens Underbridge (MVL3/29) (grade II listed, NHLE 1451854);
- Uppermill Viaduct (MVL3/31) (grade II listed, NHLE 1068120);
- Slaithwaite Viaduct (MVL3/61) (grade II listed, NHLE 1224049);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);
- Milne Viaduct (MVL3/76) (Longwood Viaduct) (grade II listed, NHLE 1220121);
- Church Street (MVL3/82) (grade II listed, NHLE 1452083);
- Huddersfield Viaduct (MVL3/92) (grade II listed, NHLE 1223531);
- Hillhouse Lane Underbridge (MVL3/94) (Willow Lane East) (grade II listed, NHLE 1432641); and
- B6118 Colne Bridge Road Overbridge (MVL3/107) (grade II, NHLE 1450265)[3].

5.2.14 Of this group, Manchester Road Underbridge (MVL3/10), Shaw Hall Bank Road Footway (MVL3/26), Church Street Overbridge (MVL3/82) and Hillhouse Lane Underbridge (MVL3/94) bear a particular relationship to Oldham Road Overbridge (MVL3/28),

[3] B6118 Colne Bridge Road Overbridge (MVL3/107)) (grade II, NHLE 1450265) will be partially demolished and rebuilt with a supplementary structure replacing its spans over the railway. Listed building consent has been granted for this considerable intervention (ref: 2021/91330), and as a result may limit the contribution that this bridge makes towards the group value with the Jee bridges.

comprising skew arched bridges of similar detail and construction. As a group, these bridges are substantially unaltered, and evidence Jee's characteristic finely detailed construction, with elegantly skewed stone soffits.

5.2.15 The group value which Oldham Road Overbridge (MVL3/28) derives from these relationships provides an understanding of the wider trends and engineering achievement which characterise both the Huddersfield & Manchester Railway and the Heroic Age (1841-1850) of railway building more generally. This group value is enhanced by the structures continuing to form part of the operational railway; as a collective group of assets, they are experienced by those following the rail line (traveling on it, or near it).

5.2.16 Masonry railway bridges across the historic Huddersfield & Manchester Railway route have been characterised as being of local or regional interest, depending on their architectural quality, contribution to wider historical interest of the route, and their group value. It has been noted however that, as a group, they are not of substantial national interest due to their dating from a period of railway development when thousands of similar structures were erected (Alan Baxter Associates, 2019, 37).

5.3 Surrounding heritage assets

5.3.1 The location of the designated and non-designated heritage assets discussed below are shown in Appendix A.

Designated Heritage Assets

5.3.2 A total of three listed buildings are present within a 250m buffer of Oldham Road Overbridge (MVL3/28). These comprise:

- Wharmton Tower (grade II listed, 1068153), a mid-19th century gothic revival villa located on the hillside c. 200 m west of Oldham Road Overbridge (MVL3/28);
- Wharf Cottages (grade II, 1067470), a terrace of 18th and 19th century houses overlooking the canal c.110 m to the south-west; and
- 17 Chew Valley Road (grade II, 1067469), a former toll cottage dating from c.1820, located c. 130 m south-east of the overbridge.

5.3.3 These structures do not enjoy any visual relationship with Oldham Road Overbridge (MVL3/28) due to the local topography, and the presence of intervening buildings and planting. The structures do not enjoy any historic relationship and do not contribute to each other's significance.

Non-Designated Heritage Assets

5.3.4 The local Historic Environment Record (HER) records six non-designated heritage asset within the 250 m study area, three of which duplicate the listed buildings identified above. The remaining records comprise:

- Greenfield Station (174.1.0), located immediately to the west;
- Wellington Mills (6105.1.0) c.210 m east; and
- Station Brow (stone heads) (9003.1.1) 100 m to the south.

5.3.5 As discussed above, Greenfield Station (174.1.0) has a direct physical and historic relationship with Oldham Road Overbridge (MVL3/28); however the station has been reconstructed, and the signal box recorded to the west of the station under this entry is now demolished, substantially reducing the significance of this asset and negating any contribution of Oldham Road Overbridge (MVL3/28) to this.

5.3.6 The former Wellington Mills site (6105.1.0) has been largely demolished and redeveloped as a supermarket, with only a single three-storey block retained to the north of Wellington Street. The Mill does not enjoy any visual relationship with the overbridge, and these assets do not derive significance from each other.

5.3.7 The remaining record comprises a findspot of medieval carved stone heads (9003.1.1), which have been recovered from the site and are no longer in-situ.

6. PROPOSALS

6.1 Background to proposals

6.1.1 In order to achieve the TRU Programme objectives of improving the reliability and resilience of the railway and to contribute to the sustainability agenda of a carbon neutral Britain by 2050, electrification of the line is required. This necessitates the installation of overhead lines along Route Section W2B.

6.1.2 Inadequate clearances to safely install OLE have been recognised as a challenge across much of TRU, preventing the installation of overhead lines below some existing overbridges. To reduce the requirement for intervention into structures along the route as far as possible, a scheme-specific pantograph has been developed which enables the use of reduced overhead line wire height under structures, subject to a site-specific risk assessment. A number of structures along the route also do not provide adequate gauge clearance for the required freight trains on the route, the requirement

for which has been considered as part of the design development process.

6.1.3 Even with use of the scheme-specific pantograph, Oldham Road Overbridge (MVL3/28) would be significantly foul, resulting in a significant clash between OLE and the structure. Similarly, the bridge does not have the required freight gauge clearance. A process of design optioneering to identify the optimal solution has therefore been undertaken.

6.2 Design development and justification

6.2.1 Design development for Oldham Road Overbridge (MVL3/28) has taken into consideration a number of factors including the significance of the listed structure, operational requirements and constructability. The design development process has also involved engagement with Historic England and OMBC (as detailed above in Table 4-1). This iterative and robust process ensures the rigorous exploration of available options, incorporating multi-disciplinary review and ongoing engagement with the heritage consultees.

6.2.2 Based on Network Rail's extensive experience delivering comparable schemes, five options were identified for further consideration at the ES3 design stage in 2021[4]. As introduced in Section 6.1 the option of retaining the structure without undertaking any works would prevent the delivery of the TRU scheme. This option was therefore discounted at an early stage. The remaining four options considered at ES3 comprised:

1. Track Lower - Lowering the height of the track to achieve the required headroom while retaining existing bridge.
2. Bridge Jacking - Increasing the height of the bridge through structurally lifting the arch barrel up from the abutments. This would require diagonal cuts to be made to separate the arch barrel from the abutments, lifting of the arch, infilling of the resulting gaps and refacing.
3. Bridge Reconstruction – Removal of the bridge arch and replacement with a deck providing sufficient clearance.
4. Bridge Removal – demolition of the existing bridge, making good the embankments and re-routing of the existing footpath.

6.2.3 A summary of the ES3 optioneering process is provided in Table 6-1.

[4] The delivery of railway investment programmes is managed by Network Rail through the use of PACE (Project Acceleration in a Controlled Environment). This provides a flexible control framework for the delivery of rail projects. Under PACE, ES3 comprises optioneering and identification of a single design option, whilst ES4 is approval of design in principle.

Table 6-1 Optioneering for Oldham Road Overbridge (MVL3/28)

Option	Key Considerations	Advantages	Disadvantages	Preferred
1) Track Lower	• Sufficient clearance needs to be achieved to enable electrification of the line and allow freight gauge clearance. • Duration of road closures to be minimised as far as possible to reduce the level of disruption to members of the public. • Time required working within the railway corridor is required to be minimised as far as possible to reduce risk to construction staff and the length of line possession (closure of the railway) and resulting disruption to railway service. • The bridge spans a railway cutting and carries a busy highway with multiple junctions. These factors restrict the accessibility of construction vehicles and the delivery of materials while the highway remains open. • Ground Investigation has revealed rock to be present at shallow depth within the railway cutting. • The bridge carries high and low voltage cables, a gas pipe, a water pipe and a number of telecoms ducts. The utilities would have need to be considered as part of any, jacking, reconstruction or removal. • The designation of the bridge as a grade II listed structure places a requirement on Network Rail to have special regard for its preservation under the Planning (Listed Buildings & Conservation Areas) Act 1990.	• Lowering of the track would enable retention of the listed bridge with raising of the parapets undertaken prevent access to OLE.	To achieve the required clearance, the track would have to be lowered by 500mm. Due to the shallow depth of rock at this location, this is a substantial engineering operation. • The feasibility of a track lower is restricted by the proximity of Greenfield Station. Substantial alteration of platforms would be required to accommodate the lowered track position.	N
2) Bridge Jacking		• This option would enable the retention of the listed bridge. The abutments, deck and parapet would be retained, although in altered form.	• Bridge jacking for masonry arch bridges is a relatively untested methodology, having been delivered on very few historic structures to date. The feasibility of jacking masonry arch structures relies on optimal site conditions, where a high level of control can be achieved and long timescales allowed for implementation. The long-term viability of this option is currently unknown.. • Bridge jacking would incur extensive disruption to railway users, requiring all works be delivered on site and little scope for off-site construction. • The location of the bridge over a cutting with limited access has significant limitations for execution of a bridge jacking operation. • Jacking of the bridge would raise the level of the highway across the bridge and require greater intervention to the surrounding highway network. • Raising of the bridge arch would impact the form and appearance of the structure, interrupting architectural features such as the stringcourse and the stone coursing across the parapets, detracting from its architectural value and integrity.	N
3) Bridge Reconstruction		• Reconstruction of the bridge would enable the preservation of some elements of the historic structure, through the retention and reuse of the bridge abutments in conjunction with the new bridge deck. • Reconstruction of the bridge affords an opportunity to improve the layout of the highway at a site with a history of vehicle collisions and regular bridge strikes. • Reconstruction of the bridge also allows for the improvement of the footway, making the railway crossing safer for pedestrians. • Reconstruction of the bridge can be delivered substantially from track level. This would minimise the need for construction access by road at this constrained site. • The installation of a preconstructed deck would minimise railway possession time and disruption to the railway network.	• Reconstruction of the bridge would result in the loss of the bridge arch and a portion of the parapets and abutments. This would result in the removal of a significant proportion of the historic bridge, substantially altering its form and appearance, and negatively impacting the integrity of the structure. • Due to site topography and potential for disruption to the local highway network, the methodology for reconstruction would be constrained.	**Y**
4) Bridge Removal		• Removal of the bridge would minimise disruption to the railway network and provide a cost effective solution.	• This option would result in the complete removal of the bridge and the loss of a grade II listed structure. • Demolishing the bridge would require the re-routing of the A670, which would not constitute a deliverable option. • Demolishing the bridge would require the re-routing of existing utilities.	N

6.2.4 Option 1 Track Lower and Option 2 Bridge Jacking would both have enabled retention of the maximum amount of historic fabric. However, these options were discounted due to the difficulty of delivering these at this constrained site, and the significant cost and disruption required. Additionally, option 2 was also discounted given the uncertainties around the long term viability and largely untested nature of bridge jacking. Option 4, Bridge Removal, was discounted due both to its negative impact on the listed structure and the key importance of maintaining a highway crossing in this location. Option 3, Bridge Reconstruction, was therefore identified as the preferred option to achieve the required clearance for Oldham Road Overbridge (MVL3/28). Whilst this option would result in significant alteration of the listed bridge, it was found to represent the most deliverable solution and would realise multiple opportunities to improve the public interface and safety adjacent to the station. This took into account the constrained nature of the site; the aims of the TRU Scheme; minimising disruption to the railway network and enabling retention of historic fabric as far as possible.

6.3 Preferred option design development

6.3.1 Design development was subsequently undertaken to mitigate as much as possible the potential impact of reconstruction on the heritage significance of Oldham Road Overbridge (MVL3/28).

6.3.2 The sympathetic approach taken to bridge reconstruction during the restoration of the Huddersfield Narrow Canal prior to its reopening in 2001 was considered as a ‘Reference Design’. The reconstructed masonry canal bridges are in proximity to Route Section W2B of the Transpennine route and successfully integrated reconstructed bridges within the historic character of the canal corridor. It was recognised by heritage stakeholders that the reconstruction of these canal bridges had successfully achieved designs which responded to the significance of the historic bridges.

6.3.3 **Form of Replacement Deck**

6.3.4 A number of constraints which had the potential to influence the feasible options for the replacement deck design were identified. These have shaped the choice of the form of the proposed replacement deck. These constraints can be summarised as follows:

- Infrastructure constraints
    - Significant diversion of an important highways route required when full road closure is in place;

- Significant highway network geometrical constraints, with adjacent junctions, significant gradients, and limited flexibility to modify highway alignment; and
- Large number of utilities cross the bridge which impact duration of road closure during construction.

- Geometric constraints
  - Gauge clearance – the minimum distance of clearance required between the soffit of the deck and the proposed OLE;
  - The bridge sits over a cutting with dramatic elevation changes each side of the railway;
  - Alignment of the highway – the requirement to consider how bridge alignment impacts the safety of multiple junctions; and
  - Proximity of Greenfield Station defines both the horizontal and vertical alignment of the tracks beneath the structure.
- Construction Constraints
  - Lift limit <30 t – due to the layout of the site, there is limited access for a large capacity crane at road level, therefore all bridge components have to be delivered from the track and installed with use of a railway crane, with a maximum lift weight capacity of 30 t;
  - Minimisation of disruption to local residents and businesses given the disruption caused by extended road closure.; and
  - Minimisation of disruption to railway users caused by railway line closures. Shift hours are limited by the window within which work can be safely completed while minimising impact on railway users.

6.3.5 Careful consideration was given to the detailing of the reconstruction to realise to improve highway safety at a location which has a documented history of road accidents and regular bridge strikes. The existing footway across the bridge is also narrow, which combined with the high level of traffic crossing the bridge makes the existing pedestrian experience sub-optimal. Three options for reconfiguring the overbridge were considered which sought to remedy both of these existing problems. These options are presented in Table 6-2.

Table 6-2 Highway configuration optioneering

Option	Assessment	Preferred	Indicative Plan
1 – Widen on north side	Three key constraining factors were identified to be associated with this option: 1) The layout of Ladcastle Road restricts widening of the north-west corner without substantial works to this highway. 2) Splayed widening of the north-east corner only (in line with the indicative red line shown on the plan) would not solve the existing visibility or alignment issues and would also not facilitate the construction of a footway of sufficient width. 3) Widening into the rock cutting on the north side of the structure would be significantly more disruptive relative to the south side, given the limited access and restrictions related to the required utility diversions. Widening on the north side would therefore not sufficiently improve the highway safety concerns and would incur significant cost and disruption..	N	2- Retain alignment and widen on south side	Widening on the south side of the structure would allow visibility to be improved on all four corners of the bridge, with views opened up along the length of the bridge facilitated by the reconfigured widened deck. Widening the structure would ease the angle of the left turn onto Oldham Road from Shaw Hall Bank Road. This widening would also allow the construction of footway on the south side of the structure. ○ The gradient of the footway would remain non-compliant in this option. ○ Considerable disruption would result from: ○ Multiple phases of utility diversion; ○ Road closures for temporary utilities diversions; ○ Demolition and reconstruction of the overbridge ;and ○ Permanent re-routing of utilities across the new span.	N	3- Retain alignment and construct separate footbridge	Construction of a separate footbridge would improve highway visibility and provide a segregated compliant footway Disruption during the reconstruction of Oldham Road Overbridge (MVL3/28) minimised. Improved highway safety due to improved visibility from the reprofiling of parapets and approach walls, and widening of the highway enabled by the re-routing of the footway away from the structure, resulting in widened splays. Inclusion of sloped access to the east and new pedestrianised area with a fall tying in with the gradient of the footbridge would allow a compliant and inclusive design to be realised in the separate footbridge. Construction of the new footbridge in advance of reconstruction of the road bridge would enable utilities to be diverted in a single stage minimising disruption to utilities provision.	**Y**	
6.3.6 Option 3 as presented in Table 6-2 was progressed as the preferred option which would deliver the required highway safety improvements while also realising an opportunity to reduce the level of disruption arising from the reconstruction of Oldham Road Overbridge (MVL3/28) by allowing the existing utilities crossing the overbridge to be diverted in a single stage. Retaining the original alignment of the road bridge would also facilitate a neater junction between the retained historic abutments and proposed stone clad concrete risers by avoiding a change to the width or placement of the abutments.

6.3.7 Following the identification of a preferred option for the highway configuration, three forms of bridge deck were considered as potential options for the reconstruction of Oldham Road Overbridge (MVL3/28) (Table 6-3):

- Network Rail standard Conarch
- Portal deck
- Prestressed deck

Table 6-3 Summary of bridge deck design options

Option	Assessment	Preferred	Indicative Photo
1 – Standard Conarch	A standard Conarch is a portal bridge consisting of standardised precast concrete frames which conform with Network Rail's specification. Where the necessary specification requirements are met, these precast units can be transported to site and installed quickly and efficiently to form a portal overbridge, with deck cast in-situ to form a continuous structure. The use of a standardised Network Rail Conarch bridge (precast concrete arch) is not considered feasible at this site and was discounted at an early stage, primarily due to its geometric constraints. The span, skew and shallow profile required to achieve gauge clearance would not work with Network Rail technical standard. The lifting capacity limitations due to the use of a railway crane also discounted the use of standard Conarch edge beams due to their weight.	N	
2 - Portal	A portal bridge consists of a series of precast concrete frames which are then transported to site and installed, with deck cast in-situ to form a continuous structure. Unlike a standard Conarch, portal bridges can be designed to bespoke dimensions, allowing site specific geometry to be accommodated. Lift weight limitations alone ruled out the benefits of this option, with lifting limitation greatly exceeded without separating the portal legs entirely, at which point the deck would effectively become a flat span and a filler beam or prestressed deck would be preferred.	N	
3 – Prestressed Deck	A flat span solution is preferred at this site due to tight gauge clearance requirements and lifting limitations. A filler beam solution was considered to align with other proposals along the route, however due to the high skew and high vehicular containment requirements, this structural form is not suitable and does not meet the Eurocode requirements for filler beam design. A prestressed beam deck is therefore proposed. This is a concrete box beam deck with prestressed tendons and an *in-situ* top slab and stitched between beams to provide strength transversely. Lift limitations at the site along with the large span requires the parapet units to be separated from the edge beams and L-units. The prestressed box beam is very stable and allows these L-units to be anchored in and connected to central beams for temporary and permanent stability. This solution will allow for maximum off-site manufacturing and minuses road closures.	**Y**	

6.3.8 The prestressed beam deck was selected as the preferred design option and further consideration was given to ensuring the proposed works would be sympathetic to the existing aesthetic of the structure.

6.3.9 In order to visually integrate the proposed precast concrete riser units with the retained masonry abutments, it is proposed to clad their external face with natural stone. The riser units would also reference the form of the existing pilasters below deck level.

6.3.10 The form of the proposed Oldham Road Footbridge (MVL3/27B) has been designed to mirror the proposed form of the reconstructed Oldham Road Overbridge (MVL3/28). Stone cladding and copers are proposed, with new substructure stone clad with similar details. The footbridge would, however employ weathering steel I-beams to form the deck rather than pre-stressed concrete beams. This arises from the requirement of the footbridge to accommodate the multiple services currently situated in MVL3/28. This allows for a single stage diversion of utilities, significantly reducing the disruption to the local highway network from construction.

6.3.11 The proposed Oldham Road Footbridge (MVL3/27B) would be accessed from Shaw Hall Bank Road via a pedestrian ramp on its eastern side, and via a newly pedestrianised area formed via the installation of a new retaining wall on the bridge's eastern side. A staircase is proposed leading from platform 2, up to this pedestrian area. This staircase would act as a secondary means of escape from the platform, allowing egress in the event of fire or other serious incident, in line with Network Rail's standards.

Parapet design

6.3.12 The parapet design for the reconstructed road bridge and the proposed footbridge have been carefully considered to reflect the character of the historic Oldham Road Overbridge (MVL3/28). The new road bridge parapet design is required to achieve a high level of vehicle containment and protection of bridge users from the electrified line, whilst responding to the significance of the existing bridge. The footbridge parapet design is required to comply with Network Rail's technical guidance and safety requirements governing the form and height of parapets over electrified railways. Numerous options for the proposed new parapet design were considered, these options are summarised below in Table 6-4, with optioneering for coping stone material presented in Table 6-5.

Table 6-4 Parapet Design Optioneering

Option	Core	Road Facing Elevation	Track Facing Elevation	Assessment	Preferred	Indicative photo
1	Concrete	Concrete with liner finish	Concrete with liner finish	Pre-cast concrete parapet with exposed concrete liner on both sides of parapet. This option would not be considered to result in a sensitive addition, with extensive amounts of concrete visible in views of and across the bridge.	N	
2	Concrete	Natural Stone cladding	Concrete with liner finish	Pre-cast concrete parapet with exposed concrete liner on track facing elevation and stone cladding installed to highway facing elevation. This option would not be considered to result in a sensitive addition, with extensive amounts of concrete visible in views of the bridge.	N	
3	Concrete	Natural stone cladding	Natural stone cladding	Concrete parapet units with natural stone cladding pre-cast onto the exterior and interior of the concrete units prior to installation. Off-site cladding would avoid the need for extended closure of this busy road to enable cladding in situ. The form of the concrete L-units can also be designed to include a feature line to reference the stringcourse present on the existing structure. This option is considered to represent the optimum balance between constructability, safety and a design sensitive to the significance of the structure. This option is considered suitable for use on both the reconstructed Oldham Road Overbridge (MVL3/28) and the proposed Oldham Road Footbridge (MVL3/27B).	**Y**	
4	Steel framework	Natural stone	Natural stone	This option comprises natural stone blocks built up in courses with joints reinforced by a stainless steel framework which is cast into the concrete edge beam. Due to the time limitations and safety implications of working in an active railway corridor coupled with the minor difference in appearance between Option 3 and Option 4, this option has not been progressed.	N	
5	Masonry	Rebuilt from original stone	Rebuilt from original stone	The new parapets are required to comply with the relevant standard for vehicle containment. Unreinforced masonry parapets using reclaimed stone would not achieve these standards and result in a safety risk that would be avoided with design option 3. Due to the time limitations and safety implications of working above an active railway corridor with limited edge protection during the rebuilding of parapets, coupled with the minor difference in appearance between Option 3 and Option 5 when viewed from the carriageway, this option has not been progressed. The quantity and quality of the stone able to be reclaimed from the site is also considered a limiting factor.	N	

Table 6-5 Coping stone optioneering

Option	Advantages	Disadvantages	Indicative image	Preferred
Option 1 – Natural Stone	• Natural stone would be sympathetic to the historic character of Oldham Road Overbridge (MVL3/28), in keeping with its architectural interest. • Natural stone copers would represent an honest intervention, with the form of the stones readable as a response to the electrification challenge, while sympathetically integrating with the existing and historic character of the bridge. • Over time, this material would weather to further integrate with the existing and proposed masonry elements of Oldham Road Overbridge (MVL3/28).	• Natural stone is the heaviest of the three options with a density of 25kN/m3, requiring consideration in the design of the structural elements of the parapet units and connection with deck. • The weight of natural stone also requires special consideration be given to manual handling safety protocols. • This option is determined to be the most expensive of the three options due to costs for quarrying and fees for masonry contractors.		**Y**
Option 2 – Coloured Concrete	• Lighter material than natural stone with a density of 18 kN/m3. • Concrete can be coloured to achieve a close visual match to the existing coping stones • This material would weather over time, increasing the similarity in appearance between coloured concrete and the existing stonework • Coloured concrete copers would be relatively cost effective, reducing the cost of this publicly funded project	• Introduction of modern material, would represent a departure from the materials historically used for coping stones. • While relatively sympathetic this material would risk negatively impacting on the architectural interest of the Oldham Road Overbridge (MVL3/28).		N
Option 3 – Glass Reinforced Plastic (GRP)	• Lighter material than natural stone. • Cost effective material, reducing the cost of this publicly funded project.	• There would be a stark visual disparity between the GRP copers and historic fabric, detracting from the architectural interest of Oldham Road Overbridge (MVL3/28). • GRP copers would not weather or soften in the way natural stone or concrete would, with the difference in material continuing to detract from the character of the historic bridge. • Of the options considered, GRP copers would result in the highest level of harm to the character of the bridge		N

6.3.13 Option 3 parapet design presented in Table 6-4 was selected as the preferred option and progressed to design given that it would ensure the proposed parapets visually integrate with the retained elements of the existing bridge, while enabling a degree of off-site construction. This approach would realise safe working for operatives constructing the Order Scheme at this location by avoiding working at height over the railway line. It would also successfully reduce the time required for line possession and highway closures compared to other options, thereby minimising disruption. The wider use of natural stone to clad the bridge riser units, concrete retaining wall to the west and ramp retaining walls to the east would contribute to a wider visually coherent intervention at this location. During removal of the existing arch, retention of historic fabric will be maximised as far as possible. Stone reclaimed from the removal of bridges along Route Section W2B may be used for elements with low impact to highway disruption as far as reasonably practicable (if construction times are increased) e.g. the ramp structure and approach walls. The form of the proposed L-Units also incorporates a feature line referencing the form of the existing string course.

6.3.14 The standard parapets height established by Network Rail's Design of Bridges (NR/L2/CIV/020) for alteration of bridges over an electrified lines is 1.8 m. However where this cannot be achieved, a minimum height of 1.5 m can be used provided sufficient justification and taking into account the risk profile of the bridge. This Network Rail Standard has its basis in ensuring safety on the railway delivers adequate protection for users and the public in line with Health and Safety legislation and Building Regulations. In this instance, risk assessments have been undertaken and it has been identified that a parapet height of 1.5 m is appropriate for the new Oldham Road Footbridge (MVL3/27B). However, as a busy highway Oldham Road Overbridge (MVL3/28) is assessed to present a high risk due to its likely use by a variety of users including heavy goods vehicles, motorcycles, cyclists and horse riders, necessitating the use of 1.8 m high parapets. Approach units are sufficiently far from the railway that this requirement does not apply, however 1.5 m min units are proposed on corners where vehicle containment/highway safety measures are beneficial.

6.3.15 Option 1 – Natural Stone is the was deemed the preferred option. As summarised in Table 6-5, the specification of natural stone copers on the road bridge and footbridge would contribute to the high-quality finish forming one of the factors embedded into the design which partially mitigates against the high level of harm arising from reconstruction. The use of stone copers across both the road bridge and footbridge would provide visual consistency between the two structures.

6.4 Description of proposals

6.4.1 It is proposed to remove the deck of the grade II listed Oldham Road Overbridge (MVL3/28) and to construct a new prestressed concrete bridge deck with new parapets and structural elements designed in a style to respond to the architectural significance of the existing historic structure (Insert 6-1, Insert 6-2 and Insert 6-3). Additionally, it is proposed to construct a new footbridge (MVL3/27B) separating pedestrian traffic from the busy road bridge, improving highway alignment and visibility to enhance road safety. The efficient re-routing of utilities on to footbridge MVL28/A during the construction phase would greatly minimise road closures and ensure a pedestrian bridge is open at all times.

6.4.2 The reconstructed bridge would consist of retained stonework abutments beneath the level of the existing impost bands, above which natural stone-clad precast concrete risers would be installed. A concrete beam deck would be installed on bearings sited on concrete cill beams. These precast concrete cill beams would be lifted into position using a railway crane, as would the longitudinal pre-stressed concrete beams. An *in-situ* concrete deck would be poured tying the concrete beams together and forming a base for the highway surface. Due to limits on lifting weight, it is proposed to lift individual precast concrete L-units onto the structure to form the parapets rather than designing edge beams with integral parapets. The L-units would be clad off site with new natural stone. Natural stone steeple copers would then be installed bringing the overall height of the parapets to 1.8 m. Two electrification hazard signs would be attached to the inside face of each parapet, along with a bridge strike sign.

6.4.3 The proposed footbridge would consist of pairs of weathering steel I-beams with cast-in concrete ducts to accommodate the multiple utilities proposed to be re-routed across the bridge. Precast U-units with natural stone cladding cast into the external elevations would be positioned onto the steels and *in-situ* stiches poured into pockets within the precast unit around the girder studs and between the separate U-units. The parapet units would be clad off site with natural stone masonry cast into the interior and exterior of the parapets. Natural stone steeple copers would then be dowelled into the top of the parapet units to meet the minimum required parapet height of 1.5 m. Two electrification hazard signs would be attached to the inside face of each parapet.

6.4.4 The installation of the new footbridge (Oldham Road Footbridge, MVL3/27B), ramp and pedestrianised area to the west of the proposed footbridge would require the prior removal of the existing railway footbridge MVL3/27A (with a new footbridge constructed at

other end of the station, note MVL3/27A works are outside the scope of the TWAO). Construction of the foundations of Oldham Road Footbridge (MVL3/27B) would involve installation of precast footings, and retaining units with concrete backing poured in lifts. Precast L units would be installed on top of the concrete fill and retaining wall units, behind which engineered fill would be taken up to the required ground level. The facing of the precast retaining units would be clad with stone, and a 1.2 m handrailing installed to provide the required edge protection. To the east of the proposed footbridge, a ramp would be formed using similar principles of concrete elements, retaining concrete poured *in-situ* with external concrete faces clad with stone, above which engineered fill would be taken up to the required footway level. The re-routed utilities would be installed in this fill. 1.2 m high railings matching those installed in the pedestrian area to the west would provide edge protection and a planter constructed to provide visual interest. The proposed staircase from platform 2 would share a similar materiality to the proposed railings, ensuring continuity of appearance.

Construction Methodology

6.4.5 Due to the constrained nature of the site and complexity of construction sequencing at Oldham Road Overbridge (MVL3/28), it is proposed to undertake construction of the footbridge (MVL3/28A) prior to works to road bridge.

6.4.6 The proposed works relating to the ancillary structures of the proposed Oldham Road Footbridge (MVL3/27B), western pedestrian area and eastern ramp would comprise:

- Removal of the existing Greenfield Station Footbridge MVL3/27A and construction of new station footbridge at the south end of the platforms (outside the scope of the TWAO).
- Removal of MVL3/27A foundations utilising a Road-Rail Vehicle to remove the arising spoil. Where existing mass concrete is to be retained, its face will be roughened to allow the installation of precast abutment and retaining wall units.
- Installation of the proposed retaining wall and footbridge foundations with the concrete cast in-situ having been delivered from the railway.
- Installation of the retaining wall and footbridge riser units and cill beams. A concrete pump would be positioned on Oldham Road to pour the concrete infill. The lightweight concrete would be built up in 1 m pours. L-Units would then be lifted into place using a railway crane and engineered fill installed to the required level. Natural stone cladding would be installed to the external face of the retaining wall. 1.2 m handrailing installed to provide

edge protection. Staircase installed to facilitate secondary means of escape from platform 2.

- Lifting into position of the proposed footbridge steel beams and U-frame parapet.
- The footbridge stitches would be poured in-situ with a concrete pump positioned on Shaw Hall Bank Road.
- The eastern ramp would be constructed consisting of excavation to the required level including the historic infill to the former station basements being broken out and removed, localised breaking down of the existing stone retaining wall, concrete blockwork retaining wall facing Shaw Hall Bank Road constructed, concrete infill poured in maximum 1 m lifts, installation of engineered fill accommodating re-routed utilities, installation of stone cladding to external faces of retaining concrete structure, installation of 1.2 m handrailing and the surfacing of new ramp.
- The utilities currently crossing Oldham Road Overbridge (MVL3/28) would be re-routed over the newly constructed footbridge, allow the reconstruction of the road bridge reducing disruption to the highway as far as possible.

6.4.7 The proposed works relating to the reconstruction of Oldham Road Overbridge (MVL3/28) would comprise:

- Careful demolition of the existing stone arch, deck and parapets.
- Reclamation of historic stonework as far as possible with transportation and secure storage at the site construction compound. Stone would be subject to preliminary rapid assessment for potential reuse and then palletised ready for transportation back to site where it will be redressed and used as appropriate across the Scheme.
- Installation of new bridge elements including natural stone clad pre-cast concrete riser units, cill beams, pre-cast concrete longitudinal beams, cast in-situ concrete deck slab, L-unit parapets and highway surface. The parapets would be clad in cut natural stone, precast into the unit and matched as closely as possible to coursing of retained fabric.
- Installation of 500 mm high natural stone steeple copers across the length of the parapets.

6.4.8 The proposed works to Oldham Road Overbridge (MVL3/28) are shown in the following drawings which accompany this application:

- MVL3/28 Oldham Road & MVL3/27B Existing and Proposed Plan (167037-TGP-25-MVL3-DRG-T-LP-162813);
- MVL3/28 Oldham Road & MVL3/27B Public Footbridge Existing and Proposed Elevation and Section (167037-TGP-25-MVL3-DRG-T-LP-162814);
- MVL3/28 Oldham Road & MVL3/27B Public Footbridge Existing and Proposed Elevation and Section (167037-TGP-25-MVL3-DRG-T-LP-162815);
- MVL3/28 Oldham Road & MVL3/27B Public Footbridge Existing and Proposed Elevation and Section (167037-TGP-25-MVL3-DRG-T-LP-162816); and
- MVL3/28 Oldham Road & MVL3/27B Public Footbridge Existing and Proposed Elevation (167037-TGP-25-MVL3-DRG-T-LP-162817).

7. IMPACT OF PROPOSALS

7.1 Oldham Road Overbridge (MVL3/28)

7.1.1 The proposed works to the grade II listed Oldham Road Overbridge (MVL3/28) are required in order to accommodate electrification of the Transpennine route as part of the wider TRU Programme. In order to construct the Scheme, the proposed works would require the removal of most of the grade II listed overbridge and its reconstruction. This will result in the loss of the majority of the structure, with the extent of retained fabric confined to the lower portions of the abutments.

7.1.2 The proposed works would largely erode the historic and architectural value of the structure through its substantial removal. The lower portions of the existing abutments would be retained, comprising isolated sections of limited architectural interest.

7.1.3 The proposed intervention will mean the substantial removal of a historic bridge that is part of the infrastructure associated with the Heroic Age (1841-50) of railway construction. It is not only a loss in its own right, but also detrimental to the historic character and group value that this structure contributes to as part of the Transpennine railway line.

7.1.4 The proposed reconstruction of the structure would have an impact on the group value of the bridges designed by A.S. Jee on the Transpennine route. The loss of Oldham Road Overbridge (MVL3/28) would remove one element of this group of 18 bridges designed by A.S. Jee (see paragraph 5.2.13) and one of the five bridges which share a common design language (see paragraph

5.2.14). The other bridges designed by Jee derive part of their value from their group relationship. The significance of each of the other bridges would therefore be slightly diminished by the removal of one of their number. The impact of this demolition would amount to less than substantial harm to the retained structures arising from a weakening of the extent to which group value contributes to their significance.

7.1.5 These proposals would therefore result in substantial harm to the significance of Oldham Road Overbridge (MVL3/28). The development of the design has embedded details to mitigate against this harm wherever possible. The use of natural stone cladding would reduce the degree to which concrete elements are visible, thereby maintaining natural stone as the visually dominant material. The use of natural stone cladding and copers would reduce the degree to which the proposed change is experienced when moving across the bridge. The reference to the existing pilasters in the form of the riser units (below deck level) would to a degree echo an aspect of the architectural language of the existing overbridge. The level of harm arising from the works would remain as substantial, but the careful consideration given to the finish of the proposed reconstructed bridge and its consistency with other listed bridge reconstructions along Route Section W2B would to a small degree offset the potential harm to Oldham Road Overbridge (MVL3/28).

7.2 Other heritage assets

7.2.1 The proposals would have no impact on any other nearby designated or non-designated heritage assets. The assets identified in Section 5.2.16 are not assessed to contribute to the significance of Oldham Road Overbridge (MVL3/28), neither are they considered to derive significance from their relationship with the listed overbridge. The proposed removal of Oldham Road Overbridge (MVL3/28) would therefore not result in any impact to the heritage significance of these surrounding assets.

7.3 Mitigation

7.3.1 The design proposals for Oldham Road Overbridge (MVL3/28) were developed through an iterative process which has robustly sought to avoid or reduce the impacts on the significance of the structure where possible. Additional information with respect to these elements of design development is included above in Section 6.2.

7.3.2 Regular consultation with historic environment stakeholders and the design team were held throughout the new bridge's design development process (see Table 4-1). Historic environment stakeholders, including Historic England and OMBC, have been

involved in the development of the design mitigation described below.

7.3.3 The design development process has resulted in mitigation being embedded within the design of the reconstruction of Oldham Road Overbridge (MVL3/28). The following design considerations have been taken into account in response to the magnitude of proposed alteration:

- The use of natural stone cladding to minimise the areas of visible concrete, reflecting the materiality of both the original bridge and many of the other retained structures along the Transpennine route. This approach would ensure natural stone remains the dominant material of the exterior faces of the bridge.
- Salvaged stone from the demolished span will also be considered for reuse on public facing elevations where additional highways disruption can be avoided.
- The form of the existing pilasters would be referenced beneath deck level in the form of the proposed stone clad riser units, referencing an aspect of the architectural language of the existing overbridge.
- A common approach taken to the design of the bridge reconstructions of Heyrod Hall Overbridge (MVL3/7), Wright's Overbridge (MVL3/20) and Oldham Road Overbridge (MVL3/28). It is considered that progressing comparable designs in tandem would enable a coherent approach and would provide a visible reference to the new phase of design upgrades taking place in the 21st century. This is another chapter in the story of the railway's development and improvement.

7.3.4 During construction of the works, toolbox talks to disseminate best practice for reducing potential impacts in relation to construction activity associated with Oldham Road Overbridge (MVL3/28) would also be delivered, for example to help avoid accidental damage.

Recommended compensation

7.3.5 In addition to these embedded measures, additional mitigation secured through the use of listed building consent conditions is recommended comprising:

- A scheme of historic building recording to Level 3 standards in accordance with Historic England guidance (Historic England 2016). This would provide a permanent record of Oldham Road Overbridge (MVL3/28) in its current form and would be lodged with the Greater Manchester Historic Environment Record. This building recording would help to compensate for the harm to significance resulting from the demolition by providing the opportunity to document the structure which will be largely lost as a result of the proposed works. The historic building recording would include:
    - Drawings.
    - Photography.
    - Written account.
- A scheme of permanent heritage interpretation would be developed and installed adjacent to Greenfield Station. This would provide the opportunity to engage members of the public with the heritage of the Huddersfield & Manchester Railway including the historic structures designed by A. S. Jee, such as Oldham Road Overbridge (MVL3/28). Further engagement with stakeholders with respect to the content of the interpretation would be undertaken during the detailed design phase.

7.4 Public benefit

7.4.1 The reconstruction of Oldham Road Overbridge (MVL3/28) and resulting substantial harm is considered justified to ensure the realisation of the substantial public benefits of the Order Scheme, in accordance with paragraph 214 of the NPPF.

7.4.2 As part of the wider TRU Programme, the Order Scheme would directly and indirectly play a role in improving regional connectivity and enhancing of some of Britain's busiest rail network, in turn realising economic, social and environmental objectives of the programme. The Transpennine route is identified as a key transport corridor, providing connections between cities in the North of England. The improvements in connectivity delivered by the TRU programme will support aspirations for economic growth and "levelling up" opportunities across the North of England.

7.4.3 The key objectives of the TRU programme are to achieve the part electrification of the Transpennine Route, improve journey times and capacity between key destinations, improve overall reliability and resilience of the route, and provide environmental benefits from modal shift from road to rail freight reducing the number of heavy vehicles on the highway network and associated air pollution. The reconstruction of Oldham Road Overbridge (MVL3/28) would directly facilitate the achievement of these aims by creating sufficient clearance beneath the bridge to accommodate electrification and the use of larger gauge trains, delivering increases in line speed, capacity and resilience.

7.4.4 Electrification would deliver faster journey times and improved performance by allowing trains to accelerate faster, and brake more efficiently. The Order Scheme will deliver faster line speeds (80 mph throughout), improving journey times along the Transpennine Route, aiming to provide an improved journey time from Leeds – Manchester Victoria of 42-44 minutes and York to Manchester Victoria of 65-67 minutes. Works to the track and structures along the Route, including reconstruction of Oldham Road Overbridge (MVL3/28), are required to accommodate this increase, and without these changes the Scheme would be unable to go ahead.

7.4.5 The reconstruction of Oldham Road Overbridge (MVL3/28) also presents an opportunity to improve highway safety at this location. The proposed design would result in improved visibility across the bridge which is situated at the confluence of a number of junctions. There is a history of road accidents in this location, with the prospect of improving visibility and providing a segregated footway assessed to comprise a significant public benefit.

7.4.6 As a vital constituent part of the Order Scheme, the proposed reconstruction would also facilitate indirect benefits associated with the wider programme of works, including station upgrades, track renewal and signalling improvements.

7.4.7 The reliability and resilience of the route and services operating on it will be improved by replacement of existing infrastructure with electrification equipment, new track drainage and signalling. Modern signalling equipment will reduce the headway between trains, allowing them to run closer together which will in turn provide increased capacity. The Scheme will provide the capability to operate four ‘express’, two ‘semi-express’ services and up to two local services an hour on the Route and will provide increased flexibility to timetable more train paths.

7.4.8 Electrification of the Scheme would provide substantial environmental and sustainability benefits and is an investment in

'greener' energy technology. This supports Network Rail's Decarbonisation Strategy and is bolstering national targets for reducing harmful emissions that cause climate change, which are set out in Government legislation for achieving net zero carbon by 2050.

7.4.9 The Order Scheme will also deliver improved safety through measures including replacement of two level crossings, installation of additional safety measures on existing bridges; enhancements to the local highway networks and new pedestrian crossing points at locations including Greenfield and Mossley Stations. Accessibility of the railway network will also be improved with the provision of fully accessible stations at Greenfield Station and the relocated Mossley Station. These measures are being brought forward as part of the wider TRU Scheme to electrify and modernise the Route, as facilitated, in part, by the reconstruction of Oldham Road Overbridge (MVL3/28).

7.4.10 Significant residual beneficial effects arising from the operation of the wider TRU Scheme have been previously identified in the Huddersfield-Westtown TWA Order Inquiry from December 2021. These included recognition of improved journey times, reliability, and capacity at the Local Authority area and in turn the sub-regional and regional level. These improvements will bring direct significant benefits to local businesses and the labour market through improved access to the local regions along the section of the route from Stalybridge to Diggle.

7.4.11 To this effect, the proposals at Oldham Road Overbridge (MVL3/28) are therefore essential in achieving the overall substantial public benefits of Route Section W2B and wider objectives of the Order Scheme, and without these interventions, the Order Scheme would not be able to be safely and successfully implemented. Alongside these substantial public benefits, the delivery of heritage interpretation adjacent to Greenfield Station would enable public engagement with the heritage of the Huddersfield & Manchester Railway, its architecture and significance.

8. CONCLUSION

8.1.1 The significance of Oldham Road Overbridge (MVL3/28) lies primarily in its historical and architectural interest. The bridge is a largely unaltered example of an 1840s skewed overbridge, dating from the Heroic Age (1841–50). The high quality of the bridge's architecture, including segmental arches with stepped rusticated voussoirs and keystones, together with the high quality workmanship of its construction is characteristic of A.S. Jee's work for the

Huddersfield & Manchester Railway. The bridge also derives significance from this direct historical relationship with the notable railway engineer A.S. Jee and the historic railway companies of the Huddersfield & Manchester Railway and LNWR. The setting of Oldham Road Overbridge (MVL3/28) makes a minor contribution to the significance of the structure, it also possesses group value as one of a number of A.S Jee structures on the Transpennine route which share a common design language.

8.1.2 A number of design options were pursued to achieve the clearance required for the OLE at Oldham Road Overbridge (MVL3/28). The OLE is a fundamental part of the Order Scheme to deliver a faster service (reduced journey time) and to make provision for electrification and the operation of a 'greener' transport solution. The development of a scheme-specific pantograph which enables the use of reduced overhead line wire height under structures, subject to a site-specific risk assessment, has not resolved the clash between proposed OLE and the listed structure.

8.1.3 A full and robust optioneering process was undertaken in consultation with the LPA and Historic England. This reviewed options comprising track lowering, bridge jacking, bridge reconstruction and bridge removal and considered these against a range of factors comprising:

- Local geology including the shallow depth of rock within the railway cutting;
- The topography of the site;
- Construction access from the highway network;
- Buildability within the constraints of working on an active railway and highway network;
- Highway and pedestrian safety requirements; and
- Whole life costs as a publicly funded project.

8.1.4 Reconstruction of the bridge was identified, on balance, to deliver the optimum solution in terms of delivering a feasible and cost-effective design solution, reducing disruption to rail and road users and the railway and highway network, and in achieving the aims of the Scheme.

8.1.5 Options were then pursued which accepted the loss of the historic bridge and made attempts to achieve an optimum reconstructed bridge design solution that retained the relationship with the railway and to an extent compensated for the removal of the existing structure. This was done through material choices (use of natural stone cladding referencing the character of the existing bridge), the

ambition to salvage stone from the demolished span for reuse on reconstruction of listed structures along the Scheme, and reference to the existing pilasters in the form of the stone clad concrete riser units.

8.1.6 The design process has been undertaken in a strongly collaborative manner and has sought historic environment professional support from the outset. The desire to maximise heritage benefits and limit harm was the primary position. Every effort was made to retain this historic structure as part of TRU. However, this was unachievable within the operational parameters set. Regular consultation with historic environment stakeholders and the design team were held throughout the design development process and several mitigation measures have been considered to attempt to avoid or reduce the impact on the significance of Oldham Road Overbridge (MVL3/28). Historic England and OMBC have accepted that the approach of reconstructing the structure is necessary to deliver the proposed Scheme, and that alternative approaches are not viable. The design development process, including engagement with historic environment stakeholders, resulted in mitigation being embedded within the design of the reconstruction as well as compensation measures being agreed, to be secured as conditions of the LBC (see Section 7.3).

8.1.7 With the reconstruction of Oldham Road Overbridge (MVL3/28), the Order Scheme can achieve key improvement objectives as outlined in Section 7.4. It would also support the achievement of substantial public benefits related to:

- Improved efficiency and reliability of the railway (in journey time saving and increased capacity);
- Reduction of delays to trains and other highway users (improved efficiency of the railways means fewer heavy vehicles on the highway network causing traffic issues and contributing to air pollution);
- Supporting sustainable transport development in line with Network Rail's Decarbonisation Strategy; and
- Improving public health and safety in providing safe routes across the railway.

8.1.8 In addition to this, the delivery of a programme of heritage interpretation at Greenfield Station would provide the opportunity for engagement of the public with the heritage of the Huddersfield & Manchester Railway.

8.1.9 The reconstruction of Oldham Road Overbridge (MVL3/28), which is a grade II listed building, would result in substantial harm to the

significance of the listed building and should be considered exceptional. This will mean the loss of an irreplaceable piece of railway infrastructure, dating to the Heroic Age (1841-50) of railway building. It is also a loss to the collection of A.S. Jee bridges that are located along this section of the Transpennine route.

8.1.10 Whilst the reconstruction of Oldham Road Overbridge (MVL3/28) is regrettable; its loss would be outweighed by the substantial public benefits that accrue from enabling the Transpennine programme to be achieved, as set out in paragraph 214 of the NPPF. The proposals would satisfy the requirements of the Oldham Local Development Framework, namely clear and convincing justification provided to outweigh the strong presumption against demolition of listed buildings as outlined in Policy 24. It would also satisfy Policy JP-P2 contained within Greater Manchester Combined Authority's Places for Everyone (2024). The proposals therefore satisfy both national and local policy requirements in relation to the justification for harm to the significance of Oldham Road Overbridge (MVL3/28).

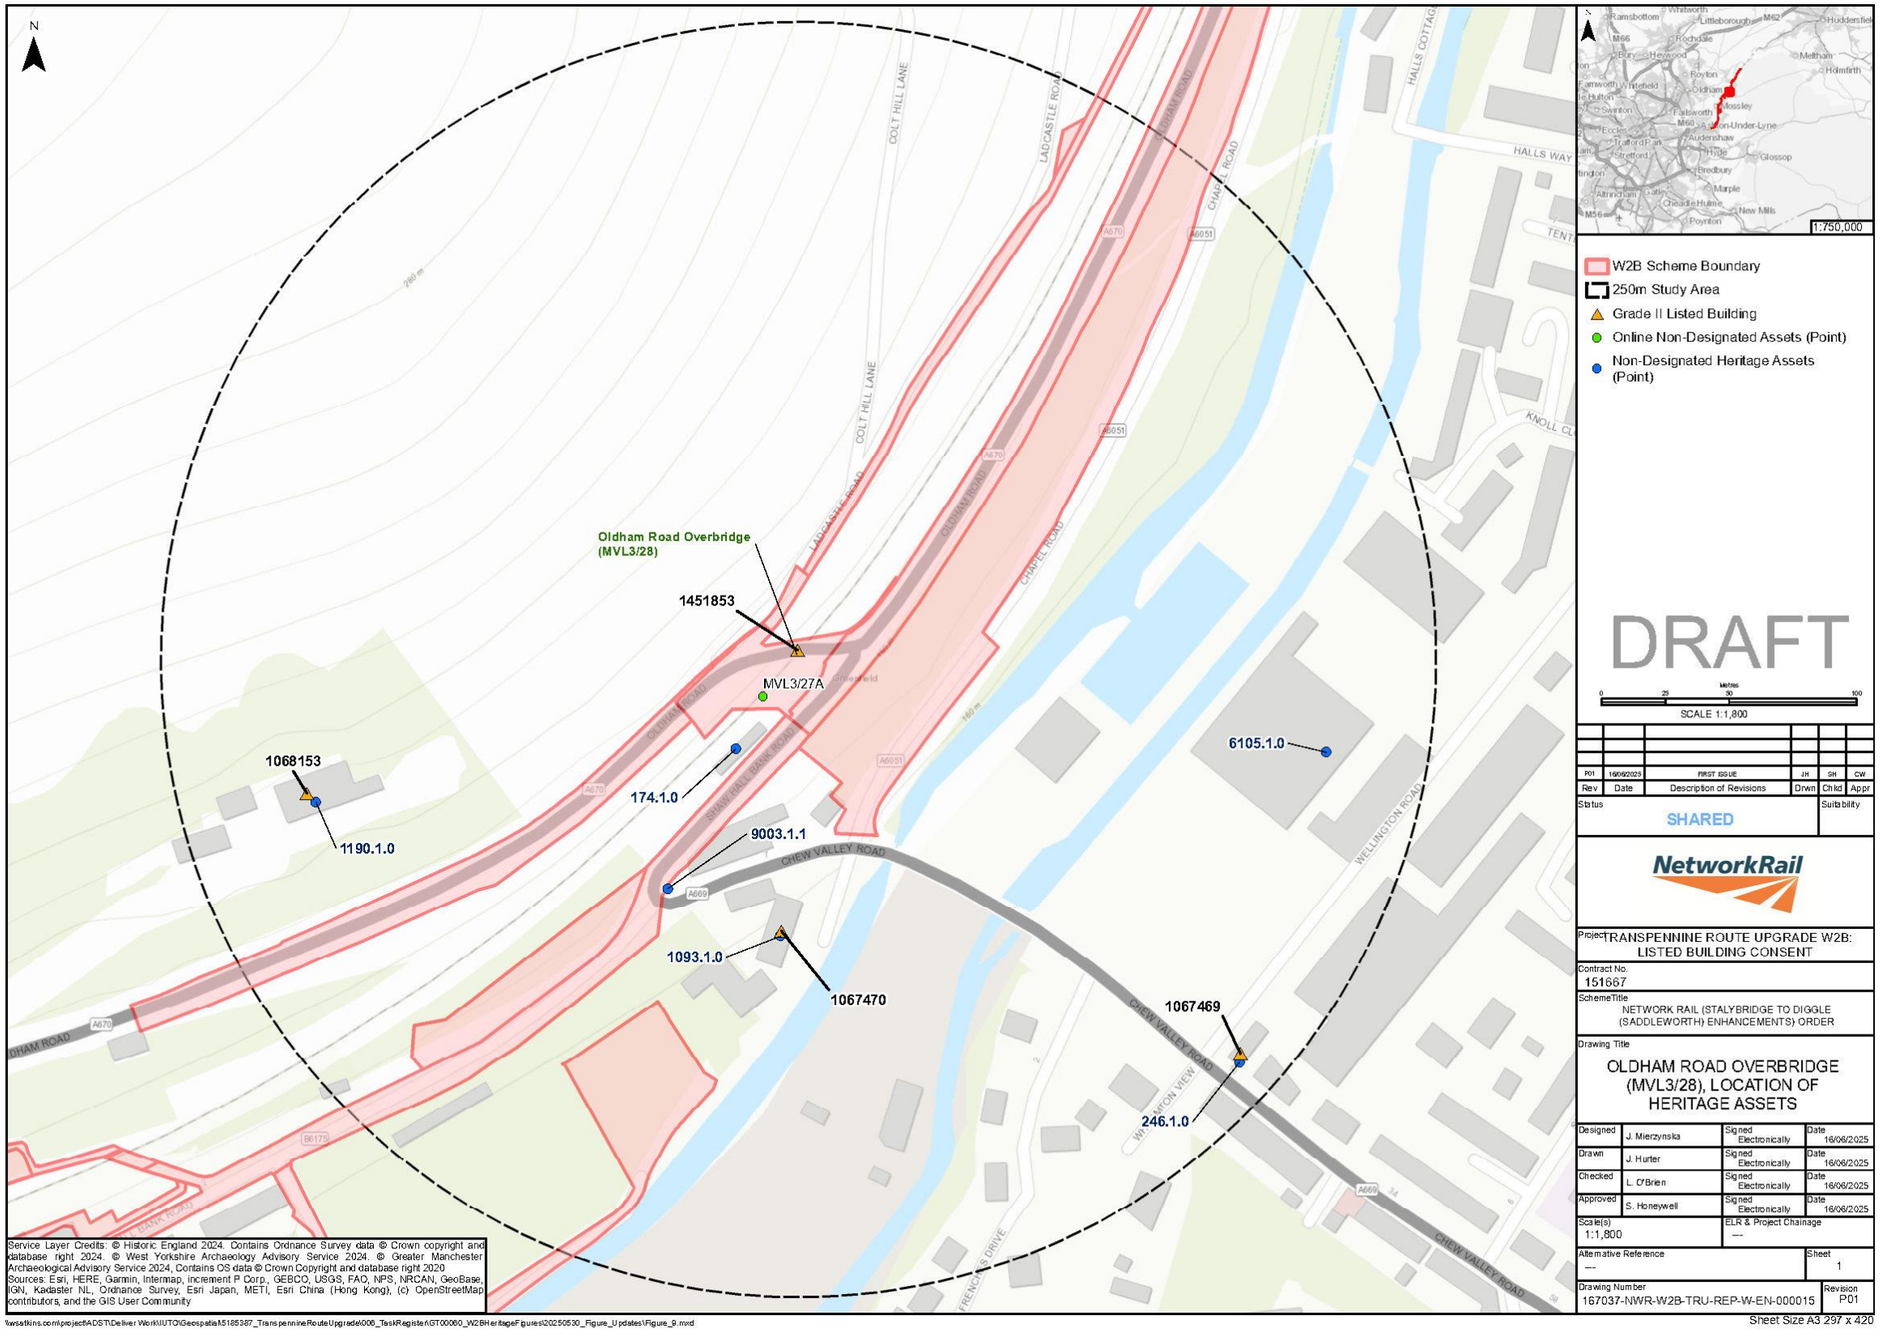
APPENDIX A – LOCATION PLAN



APPENDIX B – NATIONAL HERITAGE LIST DESCRIPTION

Official list entry

Heritage Category: Listed Building

Grade: II

List Entry Number: 1451853

Date first listed: 23-Mar-2018

List Entry Name: Railway overbridge MVL3/28, Oldham Road

Location Description: Oldham Road, adjacent to Greenfield Station.

Location

The building or site itself may lie within the boundary of more than one authority.

District: Oldham (Metropolitan Authority)

Parish: Saddleworth

National Grid Reference: SD9920204728

Summary

Railway overbridge for the Huddersfield & Manchester Railway. Mid-late 1840s by A S Jee.

Reasons for Designation

The overbridge MVL3/28 constructed in the mid-late 1840s by A S Jee for the Huddersfield & Manchester Railway, is listed at Grade II for the following principal reasons:

Historic interest:

* constructed during the heroic age of railway building and a little altered example of an 1840s overbridge on what is now one of the main railway lines in northern England;

* designed by the notable railway engineer Alfred Stanistreet Jee.

Architectural interest:

* as a well-designed and crafted stone bridge with attention to architectural detail in the use of a skew-coursed soffit, stepped, picked and tooled ashlar voussoirs with v-joints, ashlar impost

band and coping and contrasting rock-faced spandrels, parapets, piers and wing walls, all lifting it above the purely functional.

Group value:

* architecturally inter-related with the other listed structures designed by A S Jee on the Huddersfield & Manchester line.

History

In contrast to the main trunk lines of the late 1830s that were constructed by single railway companies, the route from Stalybridge to Leeds had fragmented origins and was the work of three different railway companies: the Huddersfield & Manchester Railway, Leeds, Dewsbury & Manchester Railway, and the Manchester & Leeds Railway.

The Huddersfield & Manchester Railway was authorised in 1845 and followed the route of the Huddersfield Narrow Canal for much of its length, including a railway tunnel through the Pennine hills set alongside the earlier Standedge Canal Company tunnel of 1811; in 1846 the railway company also acquired the canal. Joseph Locke and Alfred Stanistreet Jee were appointed to survey and design the new line, the two engineers having already worked together on a major project linking Manchester and Sheffield. Jee became the lead engineer for the Huddersfield line, which passed through challenging terrain, assisted by resident engineers that included his brother Moreland Jee (until 1848) and Herbert F Mackworth. Construction of the line was divided into various contracts, with many contractors being only responsible for a single cutting, viaduct or tunnel portal. The largest contract for the Standedge Tunnel between Diggle and Marsden was let to a single contractor, Thomas Nicholson in 1847. The tunnel's completion in 1849 marked the opening of the line.

The Leeds end of the route, which was also authorised in 1845, was constructed by the Leeds, Dewsbury & Manchester Railway. The engineer was Thomas Grainger who had previously largely worked in Scotland, and the line was completed in 1849.

A short three-mile section of the route between Heaton Lodge Junction and Thornhill Junction near Mirfield was developed by the Manchester & Leeds Railway and was constructed between 1837 and 1840, with George Stephenson as the chief engineer. The structures on this line were designed by Thomas Gooch under the oversight of Stephenson. In 1847 the railway company changed its name to the Lancashire & Yorkshire Railway.

In 1847 the Huddersfield & Manchester Railway and the Leeds, Dewsbury & Manchester Railway were acquired by the London & North Western Railway (LNWR) so that the company could access the city of Leeds and the textile towns of West Yorkshire. This pitted them as rivals to the Lancashire & Yorkshire Railway, although at points on the route the two companies had to work together. By 1851 the London & North Western Railway had an overall mileage of railway track of 800 miles and it became the most prominent railway company in the country and the largest joint-stock concern in the world in the late C19. Although the LNWR had a general manager, Captain Mark Huish, the lines of the Stalybridge to Leeds route still

managed their own affairs. LNWR later carried out expansion works, including the widening of tracks and bridges, the construction of additional tunnels, and station alterations. In 1923 the line became part of the London Midland & Scottish Railway, and subsequently part of the nationalised British Railways in 1948. The line, its structures and track are currently (2018) owned by Network Rail, and the passenger services operated by TransPennine Express and Northern Rail.

Oldham Road bridge dates to the construction of the Huddersfield & Manchester Railway between 1845 and 1849 when A S Jee was the lead engineer (it is depicted and named as Frenches Top Bridge on the first edition 1:10,560 OS map surveyed between 1849 and 1851 and published in 1854). The bridge was constructed to carry Oldham Road over the railway line adjacent to Greenfield Station.

Details

Railway overbridge for the Huddersfield & Manchester Railway. Mid-late 1840s by A S Jee.

MATERIALS: rock-faced and ashlar sandstone (shale grit/Kinderscout grit/millstone grit).

DESCRIPTION: the skew overbridge is located on the north-east side of Greenfield Station and carries Oldham Road over the two-line track below. The bridge has segmental arches with stepped voussoirs and slightly taller keystones. The v-jointed voussoirs are of picked ashlar with tooled margins. They spring from an ashlar impost band with similarly detailed ashlar quoins to the bridge abutments, which are otherwise constructed of coursed, rock-faced stone blocks, as are the spandrels. The bridge soffit is constructed of skew-coursed, rock-faced stone blocks. The bridge arches are framed by slightly projecting piers of rock-faced stone, the rows coursing through to the wing walls, which are continued a considerable distance round the inner curves of the road on each side. The bridge, piers, and wing walls have parapets of coursed, rock-faced stone blocks with square-moulded stone coping and a lower string course of two square-moulded bands. At the west end of the southern parapet is a former opening, now blocked.

29 November 2024

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the meetings on 6 and 21 November 2024 to review the proposals for bridges MVL3/9, 10, 23, 25, 26, 28, 29 and 31. As before, it was helpful to see the drawings in advance and then talk through the proposals with the team.

The impacts of the proposed changes and our comments are detailed below:

Proposals at *Manchester Road underbridge MVL3/10*, *Shaw Hall Bank Road underbridge MVL3/26* and *Wickens underbridge MVL3/29* will involve minor works, consisting of renewal of railings and strengthening of parapets with reinforced concrete. Visually, there will be only a minor impact, as the replacement railings are similar to the existing and the concrete strengthening will be hidden from view by the parapets. There will be a very low level of less than substantial harm to the physical fabric of the bridges due to the new railings being grouted into cored holes in the masonry parapet blocks. We do not have concerns over the works at these three bridges and recognise the efforts to maintain the visual appearance on the bridges.

The proposals for *Spring Bank Lane overbridge MVL3/9* and *Uppermill Viaduct MVL3/31* have been discussed at previous meetings, and it was helpful to see further details of the works at these structures. There will be a low level of less than substantial harm to *Spring Bank Lane overbridge* due to the introduction of raised copers, however the use of colour-matched concrete here will help to mitigate some of the harm caused by the visual impact of the new copers. Works to *Uppermill Viaduct* will likewise lead to a low level of less than substantial harm due to the introduction of brackets to support the OLE portals which will have an impact both physically and visually. We appreciate that care has been taken in the spacing of these portals so the rhythm of the bridge arches is not unduly interrupted, and so that the pattress plates are not affected.

More considerable impacts will result from proposals at *Wright's overbridge MVL3/23*, *Oaklands Road underbridge MVL3/25* and *Oldham Road overbridge (Greenfield*

Historic England

Station) MVL3/28, all of which will result in substantial harm to the significance of the designated assets.

As mentioned in previous letters, the removal of *Wright's Overbridge* will cause substantial harm to its significance through the total loss of its historic form and all original fabric, and through the re-routing of a historic public footpath. Thorough justification will need to be presented in the supporting documentation to provide the reasoning for the total loss of this bridge.

The proposed reconstruction of *Oldham Road Overbridge* has also been discussed previously. This is a skew overbridge located on the north-east side of Greenfield Station which carries Oldham Road over the track below. The bridge currently has a masonry arch which will be dismantled, along with much of the approaching wing walls, resulting in very little historic fabric being retained. The works will also necessitate the removal of the ornate historic iron railway footbridge. There will be substantial harm to the significance of the listed asset due to the severity of changes to its physical appearance and the loss of historic fabric. We recognise that some fabric will be retained for reuse as cladding material, however this will need to be carefully managed to maintain the look of the structure. The stone coursing in the existing bridge runs through the parapets into the wing walls. We would like to see care taken to replicate this effect within the reconstructed bridge to avoid a disjointed appearance to the new structure, which could arise from using mismatched stone-cladded panels. The existing bridge features flat masonry pilasters that project slightly from the bridge to either side of the arch. These have not been articulated in the proposed design and we would like to see further investigation into whether they could be incorporated into the design. This location would be suitable for display of permanent interpretation materials which could help to mitigate some of the harm by informing the public about the history of the route and the upgrade works.

Oaklands Road underbridge MVL3/25 is a skew girder bridge carrying the two-track railway line over a bend in the road below. The angled abutments have distinctive semi-octagonal piers, and the parapets are ornate balustrades of decorative cast-iron panels of Gothic arcading. The craftsmanship of the stonemasonry and attention to architectural detail lifts the design of this bridge above the purely functional and it has considerable architectural interest. There will be substantial harm to the significance of this listed bridge resulting from the proposals to reconstruct and widen the bridge deck and to rebuild the octagonal piers. In order to minimise the harm, the design of the rebuilt piers and abutments will need to be careful managed to ensure there is meaningful articulation of the distinctive shape of the piers. This includes the contrasting shape and dimensions of the piers where they extend through and above the parapet. We are comfortable with the proposals to replicate the decorative cast-iron panels to minimise the visual impact of the loss of the original fabric here.

25 June 2024

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the pre-application meetings over the last five months. These have been extremely useful in explaining the significance of the heritage assets, the design team's approach, and in exploring issues and constraints associated with electrifying the track.

This letter covers our advice regarding proposals for change to eight listed railway structures between Stalybridge and Standedge Tunnel, within the Metropolitan boroughs of Tameside and Oldham in Greater Manchester. This section of the railway is referenced as W2B.

Significance

The section of railway between Stalybridge and Standedge Tunnel was constructed in stages between 1844 and 1849. This was at the height of "railway mania"; an intense period of activity when many competing companies formed and were racing to complete sections of railway. The Stalybridge and Standedge Tunnel railway eventually became part of a wider network of sections of track that extends from Selby and York to Manchester Victoria via Leeds.

The W2B route has considerable heritage value. It traverses areas of dramatic landscape and varied geology, and has remained well preserved and largely unaltered since its opening in the 1840s. The wider railway network from the Yorkshire cities to Manchester contributed hugely to the economic and urban development of the North and was a major factor in the industrial revolution and in the development of towns.

SUITES 3.3 AND 3.4 CANADA HOUSE 3 CHEPSTOW STREET MANCHESTER M1 5FW

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

The tricky geology and terrain of the W2B route presented challenges to the engineers of the 1840s, and many of the most notable surviving features of the railway are the impressively engineered bridge and viaduct structures. These structures are predominantly built from locally sourced stone, meaning they harmonise with the landscape and contribute to local views, adding to the aesthetic value of the route. The significance of the structures also lies in the fact that they survive well and in large numbers. There have been few alterations to bridges, mainly because this section of the line has not been widened as other parts of the wider route have been.

There are eight listed railway structures that will be affected by the proposed electrification works between Stalybridge and Standedge Tunnel; these are:

- Heyrod Hall Overbridge - MVL3/7
- Heyrod Footbridge Overbridge - MVL3/8
- Spring Bank Lane Overbridge - MVL3/9
- Roughtown Road Overbridge - MVL3/17
- Wright's Mill Overbridge - MVL3/20
- Wright's Overbridge - MVL3/23
- Oldham Road Overbridge - MVL3/28
- Saddleworth Viaduct - MVL3/31

All eight of the listed structures were designed by notable railway engineer Alfred Stanistreet Jee, lead engineer for the railway between Huddersfield and Manchester. They were built in the mid-late 1840s and share many architectural characteristics, adding to their group value and enhancing their significance.

Bridges MVL3/7, MVL3/9, MVL3/17, MVL3/20, MVL3/23, and MVL3/28 are all very similar in design. All are made from coursed local sandstone and have segmental arches formed from tooled voussoirs, with larger keystones. Each has dressed ashlar impost bands, sloping string courses above the arch, and parapet copings, with shallow pyramidal caps to the slender piers. They have considerable group value and are easily identifiable in the landscape as bridges associated with the original construction of the railway. The bridges are all well designed and adapted to their individual locations, some being skewed or sloped. High quality workmanship and

Historic England is subject to both the Freedom of Information Act (2000) and Environmental Information Regulations (2004). Any information held by the organisation can be requested for release under this legislation.
We respect your privacy and the use of your information. Please read our full privacy policy for more information
https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

details such as picked and tooled ashlar voussoirs elevate their design above what is purely function, enhancing their significance further.

Heyrod Footbridge (MVL3/8) and Saddleworth Viaduct (MVL3/31) are clearly recognisable as part of the same scheme of work but differ in their form. Heyrod Footbridge features a flat span, and retains its cast-iron edge beams and brick parapets, while Saddleworth Viaduct comprises 23 sandstone arches spanning the River Tame and Huddersfield Narrow Canal.

The structures are all Grade II listed in recognition of their special architectural and historic interest at national level. Saddleworth Viaduct was listed in 1986, while all seven overbridges were listed in 2017 or 2018 after a comprehensive review of the line.

Impacts

The proposals involve demolition and reconstruction of three structures, total removal of one structure, and modifications to four structures. These works are deemed necessary to achieve the clearance required for the OLE (overhead line equipment) and to ensure safety for bridge users. The impacts of proposed works at each structure are discussed below.

Bridges requiring demolition works:

Heyrod Hall Overbridge MVL3/7 carries a short section of private road over the railway to Heyrod Hall. This bridge is in a rock cutting with very hard rock beneath the track, prohibiting track lowering.

Wright's Mill Overbridge MVL3/20 carries the public footpath and bridleway over the railway where it passes through a steep-sided rock cutting. Options to lower the track at this bridge have been investigated but discounted due to the location on the bridge in a rock cutting with very hard rock beneath. Track lowering would also have a knock-on effect to a nearby underbridge.

Oldham Road Overbridge MVL3/28 is a skew overbridge located on the north-east side of Greenfield Station and carries Oldham Road over the track below. There will be

Historic England is subject to both the Freedom of Information Act (2000) and Environmental Information Regulations (2004). Any information held by the organisation can be requested for release under this legislation.
We respect your privacy and the use of your information. Please read our full privacy policy for more information
https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

the addition of a new footbridge alongside the reconstructed road bridge. Options to lower the track at this bridge have been investigated but would be difficult to achieve due to the proximity to the station.

Proposals at these three bridges involves the complete dismantling of each bridge and reconstruction to create a raised, flat deck with sufficient clearance for OLE. Stone would be reclaimed and used to clad the inside faces of parapet walls; however matching stone is likely to be needed to clad the external sides of the parapets. New copers would also be needed to ensure parapets were the correct height.

The demolition and reconstruction of these bridges will cause substantial harm to their significance through the total loss of historic form and loss of much of their original fabric. The proposals will also diminish the group value of the historic bridges on the railway.

Wright's Overbridge MVL3/23 is a footbridge that carries a public footpath from north-west to south-east across the railway. The railway here is in a steep cutting and due to gradients, the bridge slopes down towards the south-east. Proposals involve the total removal of this bridge and diversion of the public right of way across the railway at another point.

The removal of Wright's Overbridge will cause substantial harm to its significance through the total loss of its historic form and all original fabric. Its removal will necessitate the re-routing of a historic public footpath, which is part of a network of paths in the area connecting mills and farms with workers' housing, and contributes to the landscape character of the area and to the setting of the bridge. The proposals will also further diminish the group value of the historic bridges on the railway.

Bridges requiring modifications:

Heyrod Footbridge Overbridge MVL3/8 carries a footpath running east-west over the railway, with steps on the eastern side down to a path running south-east towards Spring Bank Lane which are also listed.

Spring Bank Lane Overbridge MVL3/9 (also known as Heyrod Bridge) carries Spring Bank Lane over the railway. Due to the lie of the land the bridge slopes down towards the east. The splayed projecting wing walls are also covered by the listing.

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

Roughtown Road Overbridge MVL3/17 carries Roughtown Road north-south across the railway, to the east of Mossley Station. Due to gradients the deck slopes down towards the south. The projecting wing walls are also covered by the listing.

Minimal interventions are proposed at these three bridges, the most significant changes being the introduction of new triangular copers to ensure the correct and safe parapet heights.

The introduction of triangular copers to raise the parapet heights to 1.5m will result in a low level of less than substantial harm to the significance of the bridges through the changes to their appearance and the loss of original copers. This harm could be further lowed by using stone copers instead of concrete, and by undertaking any other restoration works required such as replacing the recently rendered section of parapet copings in the south-west corner of Roughtown Road Bridge.

Saddleworth Viaduct MVL3/31 (also known as Uppermill Arches and Uppermill Viaduct) carries the railway over a series of roads and lanes, and the River Tame and Huddersfield Narrow Canal. Due to the lack of space available on the viaduct deck, proposals here involve attaching brackets to the exterior of the viaduct for the OLE supports.

The proposed works at Saddleworth Viaduct will result in a low level of less than substantial harm to the significance of the structure through the change to its appearance and in the physical impact on the elevations of the viaduct from the brackets. This harm could be further lowed by ensuring the spacing of the masts responds to the structural and architectural rhythm of the viaduct to lessen their visual impact.

Policy

National policy relating to the conservation and enhancement of the historic environment is articulated in section 16 of the National Planning Policy Framework (NPPF, 2023). These policies state that heritage assets are an irreplaceable resource and should be conserved in a manner appropriate to their significance, so they can be enjoyed for their contribution to the quality of life of existing and future generations (NPPF para 195). Also, when considering the impact of a proposed development, great weight should be given to an asset's conservation (NPPF para 205).

Historic England

Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification (NPPF 206).

Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss. In practice this means that less harmful alternative solutions should be explored through the pre-application and application processes.

In addition to section 16 of the NPPF, we refer you to Section 12 'Achieving well-designed and beautiful places' when considering the design for replacement bridge structures. Para 132 states that being sympathetic to local character and history is important, along with a consistent and high-quality standard of design (para 133).

Position

The proposed works to upgrade the W2B section of the Transpennine route network will be the first major programme of work since its construction in the 1840s. The wider public benefits of the upgrade work to this key transport network will be vast and will have positive knock-on effects across the region. The challenging geology and hydrology across the route still present issues to engineers today, and we welcome the work that has gone into investigating alternative options to demolition and reconstruction for the bridges affected.

The proposals will result in substantial harm to the significance of bridges MVL3/7, MVL3/20, MVL3/23, and MVL3/28, with the highest level of harm to bridge MVL3/23 which will be dismantled and not reconstructed. The proposals will cause harm through the loss of the form of the arched bridges and though the loss of historic fabric. There will be the additional harm to the group value of the bridges.

We agree that the bridges are predominantly experienced from the bridge deck, and that re-use of original fabric should be focussed on the inside faces of the parapet walls to ensure the look of the bridge when crossing it is not unacceptably altered, however this re-use of materials does not lower the harm to less than substantial levels. It will be for decision takers to weigh the balance of this substantial harm against the public benefits of the scheme.

Historic England

Works to bridges MVL3/8, MVL3/9 and MVL3/17 is largely limited to raising the parapets to ensure they are the safe and correct height. We acknowledge that Network Rail has a legal obligation to take reasonable steps to prevent people from coming into contact with the OLE by ensuring parapets cannot be climbed or walked on. We appreciate the work undertaken to investigate various options for different types of pantographs to limit the height at which the parapets need to be raised to. The use of triangular copers will introduce a change in the appearance of the bridges and cause a low level of less than substantial harm to their significance, but the impact can be lessened by use of stone rather than concrete copers which will be less visually obtrusive. Parapet design should be tailored to the individual circumstances of each bridge to ensure the least harmful solution is used.

There will also be a low level of less than substantial harm at Saddleworth Viaduct from the introduction of brackets to the structure to support the OLE. This can be further lowered by thoughtful spacing of the brackets.

We welcome the detailed options appraisals undertaken during the design of the proposed works to listed structures on the W2B route. We recommend that details are finalised using bespoke designs that respond to the particular character of each structure and its setting.

Next Steps

Thank you for involving us at the pre-application stage of this project. The above advice is the response that we would give if the same proposals were put forward unamended for statutory approval.

Yours sincerely

Dear Sarah

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the recent meetings to review the draft Heritage Statements that will be submitted for Listed Building Consent applications for changes to bridges on the proposed Transpennine Route Upgrade line.

The Heritage Statements are well considered and it is clear that alternative options to reconstruction have been investigated in each case, which are helpfully set out in tables in the reports. The proposals will result in substantial harm to listed bridges along the route, however clear justification for this has been set out in the Heritage Statements.

We very much welcome the inclusion of heritage interpretation at Greenfield Station. This is a significant early rail route and there is notable educational potential in the material that has been generated from the research into the railway structures as part of this project.

Regarding Oaklands Road underbridge MVL3/25, we are comfortable with the design of the proposals for the reconstruction of the parapet and stone turrets. These have been carefully considered to minimise the visual impact.

Next Steps

We appreciate having been involved at pre-application stage in this important project, and value being able to feed into design plans. If you require further pre-application advice please get in touch.

Yours sincerely

1. INTRODUCTION

1.1 Transpennine Route Upgrade

1.1.1 The Transpennine Route Upgrade (TRU) is a major, multi-billion pound program of improvements to increase capacity, improve journey time and reliability performance of rail services on the Transpennine Route.

1.1.2 The TRU will aim to deliver:

- An improved journey time for Leeds – Manchester Victoria of 42-44mins;
- An improved journey time for York to Manchester Victoria of 65-67mins;
- Capability to operate four 'express' and two 'semi-express' services an hour;
- Capability to operate up to two 'local services' an hour on the route;(subject to future operating timetables);
- Performance of the Transpennine Route to be 92.5% or higher each period;
- Larger freight containerisation capability (W12 gauge);
- Freight paths/rights to be retained as existing; and
- A contribution to Network Rail's Decarbonisation Strategy and climate policy.

1.1.3 The Network Rail (Stalybridge to Diggle (Saddleworth) Enhancements) Order extends from Stalybridge Tunnel, in the west, through to the western portal of Standedge Tunnel (the "Order Scheme"). This section of the Transpennine route follows the Tame Valley from Stalybridge to Diggle and is referred to hereafter as Route Section W2B.

1.1.4 The TRU programme in Route Section W2B involves a variety of works including the electrification of the railway (installation of overhead line equipment (OLE) and associated infrastructure), reconstruction and modification of existing bridges to facilitate electrification of the railway, construction of a new station at Mossley, closure of Stockport Road Level Crossing and Moorgate Halt Level Crossing, railway works at Greenfield Station to support the upgrade and electrification of the railway track reconfiguration works and track lowering works through Stalybridge and Scout Tunnels.

1.1.5 Under the Planning (Listed Buildings and Conservation Areas) Act 1990, consent is required from the local planning authority for any proposed works that would affect the character of a listed building. The Transport and Works Act 1992 introduced section 12(3A) into the Planning (Listed Buildings and Conservation Areas) Act 1990, the effect of which is to "call-in" for determination by the Secretary of State applications to the local planning authority for listed building consent where such consent is required in consequence of proposals included in an application for a Transport and Works Act Order (TWAO). The procedures in the Transport and Works Applications (Listed Buildings, Conservation Areas and Ancient Monuments Procedure) Regulations 1992 then apply to the call in of such listed building consent applications.

1.1.6 This Heritage Statement has been compiled in support of an application for listed building consent by Network Rail in respect of the proposed works on the grade II listed Wickens Underbridge (MVL3/29) (NHLE 1451854). This bridge is located in Uppermill (NGR SD 99465), Oldham. A location plan is provided in Appendix A.

1.1.7 The Historic England list description (included in full in Appendix B) names the listed building as “Railway accommodation underbridge MVL3/29, Wickens”. Throughout this Heritage Statement the structure is referred to as “Wickens Underbridge (MVL3/29)” in accordance with Network Rail’s naming of the structure.

1.1.8 The preparation of this assessment has been informed by the Statement of History and Significance: West of Leeds (Alan Baxter Associates, 2024) and the Route-wide Statement of Significance (Alan Baxter Associates, 2019).

1.2 Scope

1.2.1 The requirement for assessment and its scope is guided by policy contained within the National Planning Policy Framework (NPPF, revised 2025) specifically paragraph 207, which seeks an assessment proportionate to the asset’s importance and sufficient to understand the potential impacts of development. The specific scope of this assessment is determined by Network Rail’s requirement to provide an objective assessment of the heritage value of assets that may be affected by the Order Scheme, and to appraise the nature and extent of any impact upon setting and significance.

1.2.2 This Heritage Statement will:

- Identify and discuss the heritage significance of the listed structure, including the contribution of setting;

- Present the design requirements of the Order Scheme at the structure;
- Present the process of development and optioneering which has led to the design proposal for the Order Scheme in relation to the structure;
- Identify the impacts of the design proposal on the significance of the structure, in the context of current national and local planning policy and guidance;
- Discuss any mitigation recommended in relation to the structure; and
- Consider the public benefits to be gained from the Order Scheme weighed against the impact on the significance of the structure, in line with the National Planning Policy Framework, 2025 and the Oldham Local Development Framework.

1.3 Current Condition

1.3.1 Wickens Underbridge (MVL3/29) (grade II listed, NHLE 1451854) is a mid to late 1840s masonry bridge, built to the design of Alfred Stanistreet (A.S.) Jee for the Huddersfield and Manchester Railway. The underbridge is located to the west of Uppermill and comprises a single span segmental-arched bridge which spans a footpath under the Transpennine route.

1.3.2 Wickens Underbridge (MVL3/29) was subject to detailed examination in June 2016 as part of Network Rail's maintenance regime which identified that the general condition of the structure was fair. A visual inspection was most recently undertaken in September 2021 and identified outstanding defects including:

- Defects in pointing;
- Fractures in stonework (Insert 1-1);
- Loose, displaced and bulging stonework (Insert 1-2);
- Overgrown vegetation around the structure including invasive species (Insert 1-3);
- High levels of ballast with potential to fall on the footpath; and
- Loose, corroded and missing sections of parapet handrails and safety fencing.

1.4 Summary of proposal

1.4.1 In order to achieve the TRU Programme objectives, electrification of the Route is required. This would require the alteration of a number of existing underbridges, including Wickens Underbridge (MVL3/29) to accommodate OLE, higher line speed and increased freight trains. It has been determined necessary to strengthen the underbridge using precast reinforced units as well as replace the handrails with GRP in line with Network Rail safety regulations. These works will therefore enable the implementation of the Order Scheme.

Insert 1-1 South elevation of Wickens Underbridge (MVL3/29)

0

Insert 1-2 Wickens Underbridge (MVL3/29), loose, displaced and bulging stonework.

Insert 1-3 Wickens Underbridge (MVL3/29) fracture in masonry on arch.

2. LEGISLATION AND POLICY CONTEXT

2.1 Legislation

2.1.1 The Planning (Listed Buildings and Conservation Areas) Act 1990(as amended) (the "Act") governs the designation and works to listed buildings in England.

2.1.2 The Act states in s.1 (5):

2.1.3 'In this Act "listed building" means a building which is for the time being included in a list compiled or approved by the Secretary of State under this section; and for the purposes of this Act—

a) any object or structure fixed to the building;

b) any object or structure within the curtilage of the building which, although not fixed to the building, forms part of the land and has done so since before 1st July 1948, shall be treated as part of the building.'

2.1.4 Under the Act, no one is permitted to undertake or cause to be undertaken any works that would affect the character of a listed building unless the works are authorised. Section 16 of the Act identifies that whether such works can be carried out is determined by the local planning authority or the Secretary of State:

'(1) Subject to the previous provisions of this Part, the local planning authority or, as the case may be, the Secretary of State may grant or refuse an application for listed building consent and, if they grant consent, may grant it subject to conditions.

(2) In considering whether to grant listed building consent for any works the local planning authority or the Secretary of State shall have special regard to the desirability of preserving and enhancing the building or its setting or any features of special architectural or historic interest which it possesses.

(3) Any listed building consent shall (except in so far as it otherwise provides) ensure for the benefit of the building and of all persons for the time being interested in it.'

2.1.5 In relation to the granting of listed building consent, Section 17 of the Act stipulates that conditions attached to listed building consent may include those with respect to:

a) ' the preservation of particular features of the building, either as part of it or after severance from it;

b) the making good, after the works are completed, of any damage caused to the building by the works; [and]

c) the reconstruction of the building or any part of it following the execution of any works, with the use of original materials so far as practicable and with such alterations of the interior of the building as may be specified in the conditions'.

2.1.6 It is also defined in s.17 (2) that a condition 'may also be imposed requiring specified details of the works (whether or not set out in the application) to be approved subsequently by the local planning authority or, in the case of consent granted by the Secretary of State, specifying whether such details are to be approved by the local planning authority or by him'.

2.1.7 The Act also states in s.66 (1):

'In considering whether to grant planning permission or permission in principle for development which affects a listed building or its setting, the local planning authority or, as the case may be, the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses'.

2.1.8 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) also governs duties of the local planning authority relating to conservation areas, particularly Sections 69, 72 and 74.

- Section 69 requires local planning authorities to define as conservation areas any '*areas of special architectural or historic interest the character or appearance of which it is desirable to preserve or enhance'*.
- Section 72 confers a general duty '*with respect to any buildings or other land in a conservation area… special attention shall be paid to the desirability or preserving or enhancing the character or appearance of that area'.*
- Section 74 defines that demolition of a building in a conservation area is not permitted '*without the consent of the appropriate* authority'.

2.2 National Policy

2.2.1 The National Planning Policy Framework (NPPF, 2025) sets out the Government's planning policies for England and how these should be applied to contribute to the achievement of sustainable development, supported by the Planning Practice Guidance (updated July 2019) (MHCLG, 2019).

2.2.2 Section 2 of the NPPF outlines the principles of achieving sustainable development including, in Paragraph 8, an environmental objective 'to protect and enhance our natural, built and historic environment'. Paragraph 9 sets out that these objectives should be delivered through the preparation and implementation of plans and the application of the policies within the NPPF. Section 16 of the NPPF deals specifically with the historic environment. Where changes are proposed, the NPPF sets out a clear framework to ensure that heritage assets are conserved, and where appropriate enhanced, in a manner that is consistent with their significance.

2.2.3 This Heritage Statement aims to address relevant policy within the NPPF in relation to Section 16 'Conserving and enhancing the historic environment' and includes guidance on plan making, managing Historic Environment Records; how to determine proposals affecting the historic environment; and how to consider potential impacts on significance.

2.2.4 The following paragraphs as set out in the NPPF include key provisions considered of particular importance to this application:

- Paragraph 207 – '*In determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand the potential impact of the proposal on their significance.'*
- Paragraph 212 – '*When considering the impact of a proposed development on the significance of a designated heritage asset, great weight should be given to the asset's conservation (and the more important the asset, the greater the weight should be). This is irrespective of whether any potential harm amounts to substantial harm, total loss, or less than substantial harm to its significance.'*
- Paragraph 213 – '*Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification. Substantial harm to or loss of:*
    - *a) grade II listed buildings, or grade II registered parks or gardens, should be exceptional;*
    - *b) assets of the highest significance, notably scheduled monuments, protected wreck sites, registered battlefields, grade I and II* listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional.'*

- Paragraph 214 – '*Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss, or all of the following apply:*

  a) the nature of the heritage asset prevents all reasonable uses of the site; and

  b) no viable use of the heritage asset itself can be found in the medium term through appropriate marketing that will enable its conservation; and

  c) conservation by grant-funding or some form of not for profit, charitable or public ownership is demonstrably not possible; and

  d) the harm or loss is outweighed by the benefit of bringing the site back into use.'

- Paragraph 215 – '*Where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate, securing its optimum viable use.'*

- Paragraph 216 – '*The effect of an application on the significance of a non-designated heritage asset should be taken into account in determining the application. In weighing applications that directly or indirectly affect non-designated heritage assets, a balanced judgment will be required having regard to the scale of any harm or loss and the significance of the heritage asset.'*

- Paragraph 219 - '*Local planning authorities should look for opportunities for new development within Conservation Areas and World Heritage Sites, and within the setting of heritage assets, to enhance or better reveal their significance. Proposals that preserve those elements of the setting that make a positive contribution to the asset (or which better reveal its significance) should be treated favourably.'*

Planning Practice Guidance

2.2.5 The Planning Practice Guidance (PPG) (MHCLG, 2019) provides further advice and guidance that expands the policy outlined in the NPPF. It expands on terms such as 'significance' and its importance in decision making. The PPG clarifies that being able to properly assess the nature, extent and the importance of the significance of

the heritage asset and the contribution of its setting, is very important to understanding the potential impact and acceptability of development proposals (paragraph 008 Reference ID: 18a-008-20190723).

2.2.6 The PPG states that in relation to setting, a thorough assessment of the impact on setting needs to take in to account, and be proportionate to, the significance of the heritage asset under consideration and the degree to which proposed changes enhance or detract from that significance and the ability to appreciate it (paragraph 009 Reference ID: 18a-009-20190723).

2.2.7 The extent and importance of setting is often expressed by reference to visual considerations. Although views of or from an asset will play an important part, the way in which an asset is experienced in its setting is also influenced by other environmental factors such as noise, dust and vibration from other land uses in the vicinity, and by our understanding of the historic relationship between places.

2.2.8 Paragraph 013 of the PPG recognises that the contribution that setting makes to the significance of the heritage asset does not depend on there being public right or the ability to experience that setting. When assessing any application for development which may affect the setting of a heritage asset, local planning authorities may also need to consider the implications of cumulative change (Paragraph: 013 Reference ID: 18a-013-20190723 Revision date: 23 07 2019).

2.2.9 In relation to substantial harm, the PPG states that 'it is the degree of harm to the asset's significance rather than the scale of the development that is to be assessed' (paragraph 017). Harm to heritage assets can be avoided or minimised if proposals are based on a clear understanding of the heritage asset and its setting (paragraph 008 Reference ID: 18a-008-20190723). The NPPF indicates that the degree of harm should be considered alongside any public benefits that can be delivered by development.

2.3 Local planning policy

Oldham Joint Core Strategy and Development Policies

2.3.1 Local planning policy for Oldham is provided by the Joint Core Strategy and Development Management Policies of the Oldham Local Development Framework, adopted in November 2011 (Oldham Council, 2011), and a small number of retained policies from the Unitary Development Plan (2006) (Oldham Council, 2009).

2.3.2 Policy 24 relates to the Historic Environment and is reproduced in full below:

Policy 24 Historic Environment

'Oldham has a rich historic environment with many significant and valuable features, structures and characteristics. The council will protect, conserve and enhance these heritage assets and their settings which adds to the borough's sense of place and identity.

Development proposals must have regard to:

- *National and local guidance and policies on the historic environment.*
- *Oldham Rochdale Housing Market Renewal Pathfinder Heritage Assessments.*
- *Greater Manchester and Oldham Urban Historic Landscape Characterisation Study.*

2.3.3 *Conservation Area Appraisals and Management Plans, where appropriate.*

When allocating sites and determining applications for planning and advertisement consents, the council will seek to protect, conserve and enhance the architectural features, structures, settings, historic character and significance of the borough's heritage assets and designations including:

a. *Listed buildings.*
b. *Conservation areas.*
c. *Registered parks and gardens (their historic character and setting).*
d. *Scheduled ancient monuments (their archaeological value and interest).*
e. *Significant archaeological remains.*

2.3.4 *Locally significant buildings, structures, areas or landscapes of architectural or historic interest (including non-designated locally significant assets identified in the local lists compiled by the council).*

The council will support heritage-led regeneration, including the reuse of historic buildings such as mills, to achieve economic, community and regeneration objectives, where appropriate.

Listed Buildings

Development to, or within the curtilage or vicinity of, a listed building or structure must serve to preserve or enhance its special interest and its setting. There will be a strong presumption against proposals involving the demolition of listed buildings or structures. Proposals which would lead to the loss or cause harm to grade I and II listed buildings should be wholly exceptional. Development proposals for a building incorporating a historic shop front should make provision for its retention, restoration and repair.*

Conservation Areas

Development within or affecting the setting of a conservation area, including views in or out, must serve to preserve or enhance the character or appearance of the area. Proposals for all new development, including alterations and extensions to buildings and their re-use, must have a sensitive and appropriate response to context and good attention to detail. Proposals must not adversely affect important architectural or historic features or distinctive local features or structures unless it can be demonstrated that the development brings substantial benefits to the community. Proposals for the demolition of a building in a conservation area must demonstrate that it is unrealistic for the building to continue in its existing use and a suitable alternative use cannot be found, or the building is in poor structural condition and the cost of repairing and maintaining it would be disproportionate to its importance and value and the demolition would preserve or enhance the character or appearance of the conservation area. In exceptional circumstances, the fact that a demolition would bring substantial benefits to the local community may outweigh the balance in favour of the preservation of the building.

Registered Parks and Gardens

Development which would lead to the loss of, or cause harm to, the historic character or setting of any part of registered park and garden will not be permitted.

Scheduled Monuments

Development which would lead to the loss of, or cause harm to, scheduled ancient monuments should be wholly exceptional.

Local Designations

Development which would affect the following designations will only be permitted in cases where it can be demonstrated that the benefits

of the development brings substantial benefits to the community which outweigh the preservation of the heritage asset:

Places for Everyone

2.3.5 Places for Everyone (Greater Manchester Combined Authority 2024) is a joint development plan covering nine Greater Manchester districts including Oldham, setting out a framework for sustainable development. Policy JP-P2 concerns Heritage and is of relevance to this assessment:

Policy JP-P2: Heritage

We will proactively manage and work with partners to positively conserve, sustain and enhance our historic environment and heritage assets and their settings. Opportunities will be pursued to aid the promotion, enjoyment, understanding and interpretation of heritage assets, as a means of maximising wider public benefits and reinforcing Greater Manchester's distinct character, identity and sense of place.

Local Plans will set out the key elements which contribute to the district's identity, character and distinctiveness and which should be the priority for conserving and enhancing in the future and demonstrate a clear understanding of the historic environment and the heritage values of sites, buildings or areas and their relationship with their surroundings. This knowledge should be used to inform the positive management and integration of our heritage by:

1. *Setting out a clear vision that recognises and embeds the role of heritage in place-making;*

2. *Ensuring that the heritage significance of a site or area is considered in accordance with national planning policy in the planning and design process and opportunities for interpretation and local engagement are optimised;*

3. *Integrating the conservation and enhancement of heritage assets and their settings, with creative contextual architectural responses that contribute to their significance and sense of place;*

4. *Delivering positive benefits that sustain and enhance the historic environment, as well as contributing to the economic viability, accessibility and environmental quality of a place, and to social wellbeing; and*

5. *Exploring opportunities to reduce greenhouse gas emissions that restoration of historic buildings offer.*

Particular consideration will be given to ensure that the significance of key elements of the historic environment which contribute to Greater Manchester's distinctive identity and sense of place are protected from harm. These include historic town centres, places of worship, historic transport routes including the canal network, industrial buildings and structures including textile mills, farmsteads and other sites, buildings, and areas of identified archaeological, architectural, artistic and/or historic value. Development proposals affecting designated and non-designated heritage assets and/or their settings will be considered having regard to national planning policy. Where heritage assets have been identified as being at risk, Local Plans should identify specific opportunities for them to contribute to regeneration and place-making, and they should set out strategies for their repair and re-use. Development proposals which will help safeguard the significance of and secure a sustainable future for Greater Manchester's heritage at risk will be supported in principle, provided they are not contrary to national policy or other policies in the development plan. Proposals should be informed, as necessary, by the findings and recommendations of the appropriate heritage assessment(s) in the development plan evidence base and/or any updated heritage assessment submitted as part of the planning application process.

Historic England Guidance

2.3.6 Historic England has published a series of Good Practice Advice (GPA) notes and Advice Notes (AN) of which those of most relevance to this appraisal are GPA2 – Managing Significance in Decision-taking (Historic England, 2015), GPA3 – The Setting of Heritage Assets (Historic England, 2017), and AN12, Statements of Heritage Significance (Historic England, 2019).

2.3.7 GPA2 – Managing Significance in Decision-taking emphasises the importance of having a knowledge and understanding of the significance of heritage assets likely to be affected by the development and that the 'first step for all applicants is to understand the significance of any affected heritage asset and, if relevant the contribution of its setting to its significance' (paragraph 4). Early knowledge of this information is also useful to a local planning authority in pre-application engagement with an applicant and ultimately in decision making (paragraph 7).

2.3.8 GPA3 – The Setting of Heritage Assets provides advice on the setting of heritage assets. Setting is as defined in the NPPF and comprises the surroundings in which a heritage asset is experienced. Elements of a setting can make positive or negative contributions to the significance of an asset and affect the ways in which it is experienced. Historic England state that setting does not

have a boundary and what comprises an asset's setting may change as the asset and its surrounding evolve. Setting can be extensive and particularly in urban areas or extensive landscapes can overlap with other assets. The contribution of setting to the significance of an asset is often expressed by reference to views and the GPA in paragraph 11 identifies those views, such as those that were designed or those that were intended, that contribute to understanding the significance of assets.

2.3.9 AN12, Statements of Heritage Significance outlines a recommended approach to assessing the significance of heritage assets in line with the requirements of NPPF. It includes a suggested reporting structure for a 'Statement of Heritage Significance', as well as guidance on creating a statement that is proportionate to the asset's significance and the potential degree of impact of a proposed development. The AN also offers an interpretation of the various forms of heritage interest that an asset can possess, based on the terms provided in the NPPF Glossary (Annex 2); namely archaeological, architectural, artistic, and historic.

3. ASSESSMENT METHODOLOGY

3.1 Research

3.1.1 In accordance with Historic England guidance and as determined by policy requirements, this assessment identifies the baseline heritage interest of Wickens Underbridge (MVL3/29). The historical narrative informing the baseline has been derived from a review of various resources including maps and other cartographic and photographic sources. Statutory information in relation to the designated assets has been obtained from the National Heritage List for England maintained by Historic England and the Historic Environment Record maintained by Greater Manchester Archaeology Advisory Service.

3.1.2 Additional information concerning the asset, its condition, use and setting has been obtained from a survey undertaken by suitably qualified and experienced heritage specialists on 21 and 22 May 2024, including observation from surrounding vantage points and informed by appraisal and observation derived from close working with other disciplines within the project team.

3.2 Significance and setting

3.2.1 Assessment of the significance of the heritage asset and its setting has been undertaken in consideration of guidance issued by Historic England. Significance is often established by statutory designations such as listed buildings, scheduled monuments and conservation areas. More particular advice as to what makes up significance is set out in AN12, which establishes a method for thinking consistently about the heritage values that can be ascribed to a place. When making an assessment of significance, numerous aspects are considered including architectural interest, historic interest, group value, social value, former uses and local distinctiveness. These aspects are grouped into four values defined in Annex 2 of the NPPF as historical interest, archaeological interest, artistic interest, and architectural interest.

3.2.2 In assessing whether the setting of an asset contributes to its significance, and in assessing the effect of development, Historic England GPA3 provides a checklist of attributes that may affect setting and significance under five broad categories comprising:

- The location and siting of the development;
- The form and appearance of the development;
- Additional effects (change to skyline etc.);
- Permanence; and
- Consequential effects.

4. CONSULTATION

4.1.1 Historic England and OMBC have been involved in ongoing stakeholder consultation with Network Rail through the development of Route Section W2B of the TRU.

4.1.2 Regular meetings with Historic England and OMBC have been held to discuss the design development of the proposal in relation to Wickens Underbridge (MVL3/29). Initial meetings were held periodically throughout 2021 and resumed in 2024 to discuss the overall route and design development for all structures along Route Section W2B.

4.1.3 The design development for Wickens Underbridge (MVL3/29) was presented and discussed with historic environment stakeholders on the following dates:

Table 4-1 Consultations for Wickens Underbridge (MVL3/29)

Date	Stakeholder in attendance	Key agreements/items discussed
15 February 2021	• OMBC	Project briefing on the bridge structures in order to identify the location and Order Scheme output, Network Rail electrification challenge, structures overview and next steps. • Structures presentation included MVL3/29 and identified the need to upgrade the handrails with a non-conductive material. Given that this would result in a change to the structure which is not like-for-like, this was identified to require listed building consent.
May 2021	• Historic England • OMBC • Kirklees Council	• Overview of the structures along Route Section W2B which are of historic interest, including the grade II overbridges and underbridges which are noted for their heritage significance, particularly as essential railway structures. The group value of the bridges was identified as a key contributor to significance. • Presentation of the purpose of Heritage Statements and their assessment of impact with the emerging GRIP 3 designs • Early-stage recommendations to minimise harm to significance against the requirements for justification of proposals and opportunities to pursue sensitive design and compensation. • Reassurance was provided to the councils that they will be involved in the GRIP 3 design process which will be used within the detailed design development of GRIP 4 (Single Option Development). Clarification was also provided on the sustainable heritage initiatives. • Historic England stated that they expect to get an understanding of significance at this stage and that they anticipate options to be shared for comment. Also stressed the importance of minimising harm.

Date	Stakeholder in attendance	Key agreements/items discussed
6 February 2024	• Historic England	• Overview of listed structure, and details of the challenges of the electrification of the route in relation to listed overbridges were presented. • The design approach for electrification across / under existing railway bridges was noted to have been agreed in principal by Network Rail and following consultation with the Local Authorities & Historic England at the preceding design stage.
22 April 2024	• OMBC	• Overview of preferred options for structures along the route within Oldham. This included the preferred option for Wickens Underbridge (MVL3/29) which consists of installation of GRP handrails and potential spandrel strengthening and ballast retention.
7 May 2024	• Historic England	• Presentation of development of next steps for the underbridges, including Wickens Underbridge (MVL3/29). • All of the underbridges are of masonry arch construction (apart from MVL3/25) and would be progressed once the track designs are received.
6 November 2024	• Historic England	• Draft listed building consent drawings presented for discussion • Presentation of interventions required to strengthen Wickens Underbridge (MVL3/29) and replace handrails in compliance with Network Rail safety standards. Acknowledgement that there will be minimal change to the bridge's appearance. • Confirmation that this will not entail raising the parapet, and no additional OLE equipment will be required.

Date	Stakeholder in attendance	Key agreements/items discussed
29 November 2024	• Historic England	• In their formal pre-application advice letter, Historic England confirmed that proposals for Wickens Underbridge (MVL3/29) would result in *'a very low level of less than substantial harm'* (Appendix C.1).
2 April 2025	• OMBC	• Presentation of overview of the aims and objectives of TRU to OMBC heritage officers, with emphasis on the historic context of Route Section W2B and the 12 listed building consents applications which are being prepared for the various works to the grade II listed bridges and viaduct along the route section. • Network Rail requested for the draft Heritage Statement to be reviewed by the Council for comment and feedback. • Presentation of overview of electrification challenges caused by the existing arch profile of a number of existing bridges and have developed bespoke solutions for these to achieve the required clearance.
4 April 2025	• Historic England	• Overview of draft comments from Historic England. Request to draw out the heritage interpretation in the reports as part of the heritage benefits. • Historic England were content with the assessment of significance for all structures, and noted that the optioneering tables were helpful. Historic England requestion for further details on the heritage interpretation as part of the heritage benefits.
12 May 2025	• OMBC	• Proposals for Wickens Underbridge (MVL3/29) presented to OMBC heritage officers, noting less than substantial harm to the structures. • Existing handrail across the structure noted to be modern and metallic, and proposed to be replaced with non-metallic fitting of similar appearance.
24 June 2025	• OMBC	• Pre-application advice letter received from OMBC outlining local planning authority advice following review of the draft listed building consent application material. • OMBC found that the proposals at Wickens Underbridge (MVL3/29) would result in a low level of less than substantial harm arising from minor physical intervention.

Date	Stakeholder in attendance	Key agreements/items discussed
		• OMBC highlight that clear and convincing justification will be required for any harm arising to designated heritage assets, with substantial benefits required to outweigh substantial harm. • A high level of harm was also found to the group value of the bridges designed by A.S Jee on the TransPennine Route, due to the proposed demolition of Wright's Mill Overbridge (MVL3/20) and reconstruction of four other bridges and a limited level of harm to group value arising from the alteration of three other structures (including Wickens Underbridge (MVL3/29)).
18 July 2025	• Historic England	• Pre-application advice letter received from Historic England providing overarching feedback on proposals affecting listed bridges between Stalybridge and Standedge Tunnel (See Appendix C). • Acknowledgment given to the collaborative approach taken at pre-application stage, to fully explore alternative options to reconstruction and for the opportunity for Historic England to feed into design plans. • The heritage statements adjudged to be well considered with clear justification having been provided for the substantial harm identified to those structures proposed for removal or reconstruction. • The inclusion of interpretation at Greenfield Station is very much welcomed by Historic England.

5. HERITAGE ASSSETS AND THEIR SIGNIFICANCE

5.1 History of the W2B Transpennine Route

5.1.1 The railway connecting Stalybridge to Huddersfield, which runs over Uppermill Viaduct (MVL3/31) in Uppermill, was constructed by the Huddersfield & Manchester Railway Company between 1846 and 1849. The mid-1840s was a period of commercial confidence and massive expansion in the railway network across England, known as 'Railway Mania' which has been described by Historic England as the Heroic Age of railway building (Historic England, 2017b). Between 1845 and 1852 the railway network expanded from 2,345 miles to 7,272 miles (3774km to 11,703km) (Alan Baxter Associates, 2019). Constructed at the height of this boom, the Stalybridge to Leeds line was a product of this trend. Traversing a challenging landscape through the Pennines, the line was planned to follow the route of the Huddersfield Narrow Canal for much of its length, with the canal acquired by the Railway Company the year after its authorisation (Alan Baxter Associates, 2019). These difficult landscape conditions resulted in the need to build several major viaducts and tunnels. These included Standedge Tunnel through the Pennines, which was constructed alongside the 1811 canal tunnel and is *'indisputably significant as a major engineering achievement'* (Alan Baxter Associates, 2024).

5.1.2 The development and expansion of the railways during the 19th century transformed the landscape and settlements through which they passed, fuelling industrial growth and settlement expansion. The impact of improved communications, first with the arrival of the canal in 1811, and then the railway in 1849, provided valuable links with Huddersfield, Manchester and Leeds, enabling import of raw materials and export of manufactured goods. This fuelled the gradual industrialisation and settlement expansion along the Tame Valley. This can be seen on historic Ordnance Survey maps dating from the 19th and early 20th century where industrial development including mills, dyeworks, printworks and quarries, is shown to have been present along the route of the railway and extending into the more upland areas around Saddleworth and Harrop Dale, whilst settlements such as Mossley and Dobcross gradually expanded.

5.1.3 Uppermill Viaduct (MVL3/31) was constructed for the Huddersfield & Manchester Railway Company in the mid to late 1840s. The principal engineer for the Huddersfield & Manchester Railway was Alfred Stanistreet (A. S.) Jee (1816–1858), who was assisted by the more renowned engineer Joseph Locke (1805–1860). Jee's work on the Huddersfield & Manchester Railway represents, arguably, his greatest achievement. This can be seen particularly in the construction of the Standedge Tunnel, which at over three miles long

was one of the longest and most difficult in England, but also through the various large-scale viaducts along the route. In the 1850s, he worked internationally on the Spanish line from Alar-del-Rey to Reynosa where his skill in design, his accuracy and his completeness of the details earned him high praise. He died in a fatal accident upon the opening of the second portion of that line.

5.1.4 In 1847, prior to the opening of the line, the Huddersfield & Manchester Railway Company was taken over by the London and North Western Railway (LNWR). As part of the LNWR network, the Huddersfield & Manchester Railway formed part of a direct route from Manchester to the West Riding, enabling the LNWR to access the textile and coal industries of West Yorkshire. By 1851, the LNWR was the most prominent railway company of the period, with over 800 miles of track and was the largest joint-stock concern of its time, capitalised at £29 million. The line was acquired by the London Midland and Scottish Railway in 1923, before being nationalised in 1948.

5.1.5 Whilst other parts of the Transpennine route were subject to significant alterations, the Huddersfield & Manchester Railway between Standedge Tunnel and Stalybridge was subject to relatively limited alteration. The Micklehurst Loop was constructed from 1881-85 to provide additional capacity, and diverged from the existing railway to the east of the Tame Vally, avoiding physical interaction with the majority of its alignment. A new junction to the south of Greenfield Station is shown on historic maps from the early 20th century as additional tracks toward Oldham were established from this station. However similarly to the Micklehurst loop, the additional lines diverged from the main Huddersfield line, running westwards at its intersection with Shaw Hall Bank Road Footway (MVL3/26). The railway was also widened to the east of Diggle to accommodate additional tracks serving new bores for the Standedge Tunnel which were added in 1868-71 and 1894, necessitating widening of bridges to the east of the route.

5.1.6 Piecemeal change has occurred on the Huddersfield & Manchester Railway, most notably with the closure of a small number of stations along the route, such as Diggle and Saddleworth Stations. The route today forms part of the wider Transpennine route between York, Selby and Manchester, which comprises sections of rail line developed by different railway companies.

5.1.7 The history and significance of the Transpennine route is discussed at more length in the Route-Wide Statement of Significance (Alan Baxter Associates, 2019). This was produced to characterise the overall heritage significance of the Transpennine route.

5.2 Wickens Underbridge (MVL3/29)

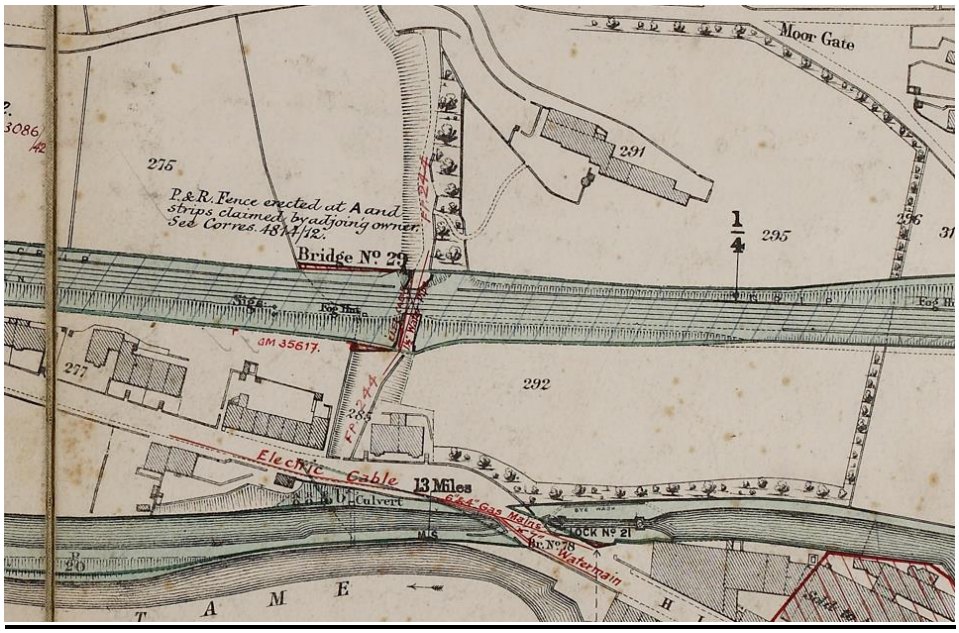
History

5.2.1 Wickens Underbridge (MVL3/29) was constructed between 1845 and 1849 during the Heroic Age of railway building. The single-span accommodation bridge was designed by A.S. Jee for the Huddersfield & Manchester Railway.

5.2.2 In the mid-19th century, the village of Uppermill was industrial in character. Within Uppermill there were numerous textile mills, the growth of which had been fuelled by the position of the settlement on the Huddersfield Narrow Canal which opened in 1811. Located on the south edge of the village, Wickens Underbridge (MVL3/29) is not depicted on the 1st edition 6" Ordnance Survey map of 1854, although the footpath to the bridge is indicated (Insert 5-1). This is likely to be a drafting error, as construction of the underbridge was undertaken as an integral part of the railway embankment's construction between 1845 and 1849. To the west of the railway line a large building named as Wickens is labelled to the north-west of the underbridge. The building remains extant today, continuing in use as a farm. Wickens also gave its name to a sandstone quarry located to the south of the building and a watercourse running down the hillside to the west of this which is labelled as Wickens Clough. To the east of the line, the River Tame and Huddersfield Canal run in proximity to the end of High Street. Wickens Underbridge (MVL3/29) provided access from Wickens Farm and Wickens Quarry to the base of High Street and the Huddersfield Narrow Canal, providing an important link through the railway embankment to enable access to these important communication routes.

5.2.3 Subsequent Ordnance Survey map editions show a similar situation, through fully depicting the underbridge. Residential development is shown to gradually extend southwards from Uppermill, with the land to the west of the railway remaining undeveloped, likely due to its steep topography.

Insert 5-1 Extract from the 1st edition 6" Ordnance Survey map of 1854. Wickens Underbridge (MVL3/28) is located just below the label for Wade Lock Bridge on the railway line.



Insert 5-2 Historic line plan of Huddersfield and Manchester Railway and Canal by LNWR in 1905 in which Wickens Underbridge (MVL3/29) is illustrated. Wickens is annotated *29* on the map.

Description

5.2.4 Wickens Underbridge (MVL3/29; Insert 5-3 and Insert 5-4) comprises a single semi-circular accommodation underbridge which provides access east-west under the embankment for the Transpennine route. The bridge survives in its original form, with no evidence of significant alteration.

5.2.5 Wickens Underbridge (MVL3/29) is constructed in regular-coursed, quarry-faced buff sandstone, with smaller coursed ashlar blocks employed across the arch soffit. The underbridge is formed by a deep semi-circular arch with rusticated v-joined picked ashlar voussoirs with projecting keystones with diagonal tooling. The arch springs from squared and tooled ashlar impost bands. A square moulded band above the arch supports the deep, plain ashlar parapet across the top of the structure. The parapet is formed of discrete stone blocks and a metallic tubular handrail is fixed into this. The wingwalls project at right angles from the arch, and are raked and splayed, terminating in slightly projecting piers of rock-faced stone blocks with squared-moulded ashlar coping stone.

5.2.6 The setting of Wickens Underbridge (MVL3/29) is localised due to the presence of mature planting to the east and west of the structure (Insert 5-5 and Insert 5-6). Whilst the underbridge accommodates a pedestrian footpath, it is set back from Oldham Road and is screened from the road by dense vegetation. Views of the underbridge are gradually revealed as one moves along the footpath and under the structure. The relationship of the bridge with the Transpennine route is its key contributor towards its significance and continues to be legible today.

Insert 5-3 Wickens Underbridge (MVL3/29) east elevation.

Insert 5-4 Wickens Underbridge (MVL3/29) west elevation.

Insert 5-5 The setting of Wickens Underbridge (MVL3/29) looking west.

Insert 5-6 Wickens Underbridge (MVL3/29) looking west towards its east elevation

Significance

5.2.7 Wickens Underbridge (MVL3/29) was designated as a grade II listed building in March 2018. The Historic England List Entry description identifies the bridge to be of special interest for the following reasons:

- Historic interest:
    - Constructed during the heroic age of railway building and a little altered example of an 1840s accommodation underbridge on what is now one of the main railway lines in northern England;
    - Designed by the notable railway engineer Alfred Stanistreet Jee.
- Architectural interest:
    - As a well-designed bridge, with good quality stone masonry and attention to architectural detail in its use of picked and tooled, v-jointed voussoirs with larger keystones, ashlar impost bands, parapets, coping and soffit and contrasting rock-faced stonework of the spandrels, abutments and raked and splayed wing walls which all lift it above the purely functional.
- Group value:
    - Architecturally inter-related with the other listed structures designed by A S Jee on the Huddersfield and Manchester line.

5.2.8 Wickens Underbridge (MVL3/29) is of significance as an unaltered example of an 1840s accommodation underbridge, dating from the Heroic Age (1841–50) of railway building and the period of 'railway mania' which marked a time of commercial confidence and expansion in the railways. The bridge's direct historic relationship with historic railway companies of the period, comprising the Huddersfield & Manchester Railway and LNWR, and the notable railway engineer A. S. Jee, who also designed similar structures along the route give the structure historical value from which it derives significance. The underbridge remains in use as a part of the operational railway network and, together with surviving contemporary structures, evidences the historic infrastructure of the Huddersfield & Manchester Railway.

5.2.9 Wickens Underbridge (MVL3/29) derives significance from the quality of its architecture and construction, a characteristic feature of Jee's work for the Huddersfield & Manchester Railway. Architectural elements such as the rusticated voussoirs and the quality of workmanship across the structure are notable features of Jee's design which elevates the structure above the purely functional. The

design language used is consistent with other bridges built by A.S. Jee for the Huddersfield & Manchester Railway, which further contributes towards a consistency in architectural character and an appreciation of their group value. The bridge survives in its original form, with no evidence of significant intervention or alteration, and remains in use for its original purpose. The integrity of the structure enables Jee's original design intent and the historic function of the structure to be understood, contributing to its significance.

5.2.10 The setting of Wickens Underbridge (MVL3/29) makes a limited contribution to its significance, deriving principally from the continued historic and functional relationship between the bridge and the Transpennine route.

Group value

5.2.11 As identified in the list description, Wickens Underbridge (MVL3/29) is recognised to be of group value with other listed structures by A.S. Jee on the Huddersfield & Manchester Railway[1]. These comprise:

- Heyrod Hall Overbridge (MVL3/7) (grade II listed, NHLE 1449242);
- Springbank Lane Footbridge (MVL3/8) (grade II listed, NHLE 1452382);
- Springbank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (grade II listed, NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405);
- Wright's Mill Overbridge (MVL3/20) (grade II listed, NHLE 1452406);
- Wright's Overbridge (MVL3/23) (grade II listed, NHLE 1452409);
- Royal George Underbridge (MVL3/25) (grade II listed, NHLE 1451848);
- Shaw Hall Bank Road Footway (MVL3/26) (grade II listed, NHLE 1451852);

[1] Wheatley's Overbridge (MVL3/103) (grade II listed NHLE 1450537) was designed by A.S. Jee for the Huddersfield & Manchester Railway. The Overbridge was granted consent for extensive change as part of the Huddersfield to Westtown (Dewsbury) Order section of the Transpennine Route Upgrade, and will be demolished and replaced with a new structure (ref 2021/91337). This is likely to result in de-listing. As such its contribution to group value has therefore been excluded from this assessment.

- Oldham Road Overbridge (MVL3/28) (grade II listed, NHLE 1451853);
- Uppermill Viaduct (MVL3/31) (grade II listed, NHLE 1068120);
- Slaithwaite Viaduct (MVL3/61) (grade II listed, NHLE 1224049);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);
- Milne Viaduct (MVL3/76) (Longwood Viaduct) (grade II listed, NHLE 1220121);
- Church Street (MVL3/82) (grade II listed, NHLE 1452083);
- Huddersfield Viaduct (MVL3/92) (grade II listed, NHLE 223531);
- Hillhouse Lane Underbridge (MVL3/94) (Willow Lane East) (grade II listed, NHLE 1432641); and
- B6118 Colne Bridge Road Overbridge (MVL3/107) (grade II, NHLE 1450265)[2]

5.2.12 Wickens Underbridge (MVL3/29) shares a common design language with Heyrod Hall Overbridge (MVL3/7), Springbank Lane Overbridge (MVL3/9), Roughtown Road Overbridge (MVL3/17), Roughtown Road Overbridge (MVL3/17), Wright's Mill Overbridge (MVL3/20) and Wright's Overbridge (MVL3/23), all of which utilise the same architectural detailing and architectural articulation to the arch As a group, these bridges are substantially unaltered, and evidence Jee's characteristic finely detailed construction, with elegantly skewed stone soffits.

5.2.13 The group value which Wickens Underbridge (MVL3/29) derives from these relationships provides an understanding of the wider trends and engineering achievement which characterise both the Huddersfield & Manchester Railway and the Heroic Age of railway building (1825–41) more generally. This group value is enhanced by the structures continuing to form part of the operational railway; as a collective group of assets, they are experienced by those following the rail line (traveling on it, or near it) as coherent features of a single historic route.

5.2.14 Masonry railway bridges across the historic Huddersfield & Manchester Railway route have been characterised as being of local or regional interest, depending on their architectural quality, contribution to wider historical interest of the route, and their group value (Alan Baxter and Associates, 2024). It has been noted in the Route Wide Statement of Significance, however that, as a group,

[2] B6118 Colne Bridge Road Overbridge (MVL3/107)) (grade II, NHLE 1450265) will be partially demolished and rebuilt with a supplementary structure replacing its spans over the railway. Listed building consent has been granted for this considerable intervention (ref: 2021/91330), and as a result may limit the contribution that this bridge makes towards the group value with the Jee bridges.

they are not of substantial national interest due to their dating from a period of railway development when thousands of similar structures were erected (Alan Baxter and Associates, 2024).

5.3 Surrounding heritage assets

5.3.1 The location of the designated and non-designated heritage assets discussed below are shown in Appendix A.

Designated heritage assets

5.3.2 There are no listed buildings present within 250m of Wickens Underbridge (MVL3/29).

5.3.3 Wickens Underbridge (MVL3/29) is located adjacent to the Uppermill Conservation Area, the boundary of which follows the base of the railway embankment to the east of the Transpennine route. The conservation area covers the core of the historic village of Uppermill and the Huddersfield Narrow Canal which runs parallel to the railway along the west edge of the village. Close to Wickens Underbridge (MVL3/29), the conservation area is characterised by the presence of residential buildings of 18th to 20th century date, lining Oldham Road, looking eastwards across the canal and river. The railway does not form a prominent feature in the setting of the conservation area in this locale, being set up a steep slope and largely screened by buildings and mature planting. Wickens Underbridge (MVL3/29) is screened by vegetation and buildings along the roadside and does not form a prominent or contributing element in the setting of the conservation area.

Non-designated heritage assets

5.3.4 The Greater Manchester Historic Environment Record (HER) records six non-designated heritage assets and 2 findspots within 250m of Wickens Underbridge (MVL3/29). These comprise:

- Station Brow, Diggle (stone heads) (9003.1.0) located c. 210 m to the south-east;
- 146 Carr Lane (stone head) (9017.1.0) located c.165 m to the east;
- Oldham Road (19032.1.0) located c.20 m to the east;
- Canal Lock 21W on the Huddersfield Narrow Canal (19036.1.0) located c.85 m to the north-east;
- Sacred Heart & St William Catholic Church (19046.1.0) located c.230 m to the north-east;

- K6 Telephone Kiosk (19045.1.0) located c.200 m to the north-east;
- Alexandra Mill (6108.1.0) located c. 210 m to the north-east; and
- Victoria Mill (6107.1.0) located approximately 200 m to the north-east.

5.3.5 2 Oldham Road (19032.1.0) is an early 20th century red brick villa designed in a classical revival style. Sited on the hillslope adjacent to the Transpennine route, the building is oriented to the east to enjoy views across the Tame Valley and form a formal and imposing structure on the approach to Uppermill. Whilst located in proximity to the Wickens Underbridge (MVL3/28), the underbridge does not contribute to the significance of 2 Oldham Road, due to its historic functional association with the railway and screening by vegetation in views to and from the asset.

5.3.6 Canal Lock 21W (19036.1.0), the Sacred Heart & St William Catholic Church (19046.1.0), K6 Telephone Kiosk (19045.1.0), Alexandra Mill (6108.1.0) and Victoria Mill (6107.1.0) are located between 150 m and 230 m from Wickens Underbridge (MVL3/29) within the built-up townscape of Uppermill. These assets do not enjoy a historic or visual relationship with the bridge and do not derive any contribution to significance from its presence.

5.3.7 The remaining records (9003.1.0 and 9017.1.0) comprises findspots of carved stone heads (9003.1.1), which have been removed and therefore do not contribute to setting.

6. PROPOSALS

6.1 Background of proposals

6.1.1 In order to achieve the TRU Programme objectives of improving journey times, capacity, overall reliability and resilience, and delivering environmental benefits, the electrification of the railway line and achievement of increased line speed is required. Works to the underbridges along the route are required to accommodate the resulting additional loadings on the structures resulting from increased line speeds and increased train loading.

6.1.2 Wickens Underbridge (MVL3/29) is currently understrength. As such, provisions to safeguard the structure ahead of the increase in line speed are required. The increased line speed and train loading will impose increased forces on the underbridge. Without mitigation, this has the potential to affect the structural condition of the underbridge. The proposed design has therefore been developed to address these considerations, whilst safeguarding the significance of the structure.

6.2 Design development and justification

6.2.1 Key constraints taken into consideration during the development of proposals for Wickens Underbridge (MVL3/29) comprised:

- Time required working within the railway corridor is required to be minimised as much as possible to reduce risk to construction staff and the length of line possession (closure of the railway) and resulting disruption to railway service.
- The bridge is location within an area characterised by dense vegetation. This constrains the accessibility of the site to construction vehicles and the delivery of materials/components.
- The designation of the bridge as a grade II listed structure places a requirement on Network Rail to have special regards for its preservation under the Planning (Listed Building & Conservation Areas) Act 1990.

6.2.2 During the ES3 design stage3, proposals for Wickens Underbridge (MVL3/29) considered only installing upgraded GRP Handrails. During ES4 design stage, a comprehensive review was undertaken of the preferred options identified at ES3 across the Route Section W2B as part of a validation exercise. At this time, the requirement for strengthening of Wickens Underbridge (MVL3/29) was identified and proposals for the structure developed. The proposals for these works have been developed to minimise intervention into the historic structure and alteration of its appearance as far as possible, whilst mitigating the impact of increased lien speed and heaver trains.

6.2.3 The proposals have been developed in consultation with Historic England and OMBC). This iterative and robust design process has been undertaken to minimise the extent of interventions to the grade II listed underbridge in order to maintain the existing appearance and significance of the structure.

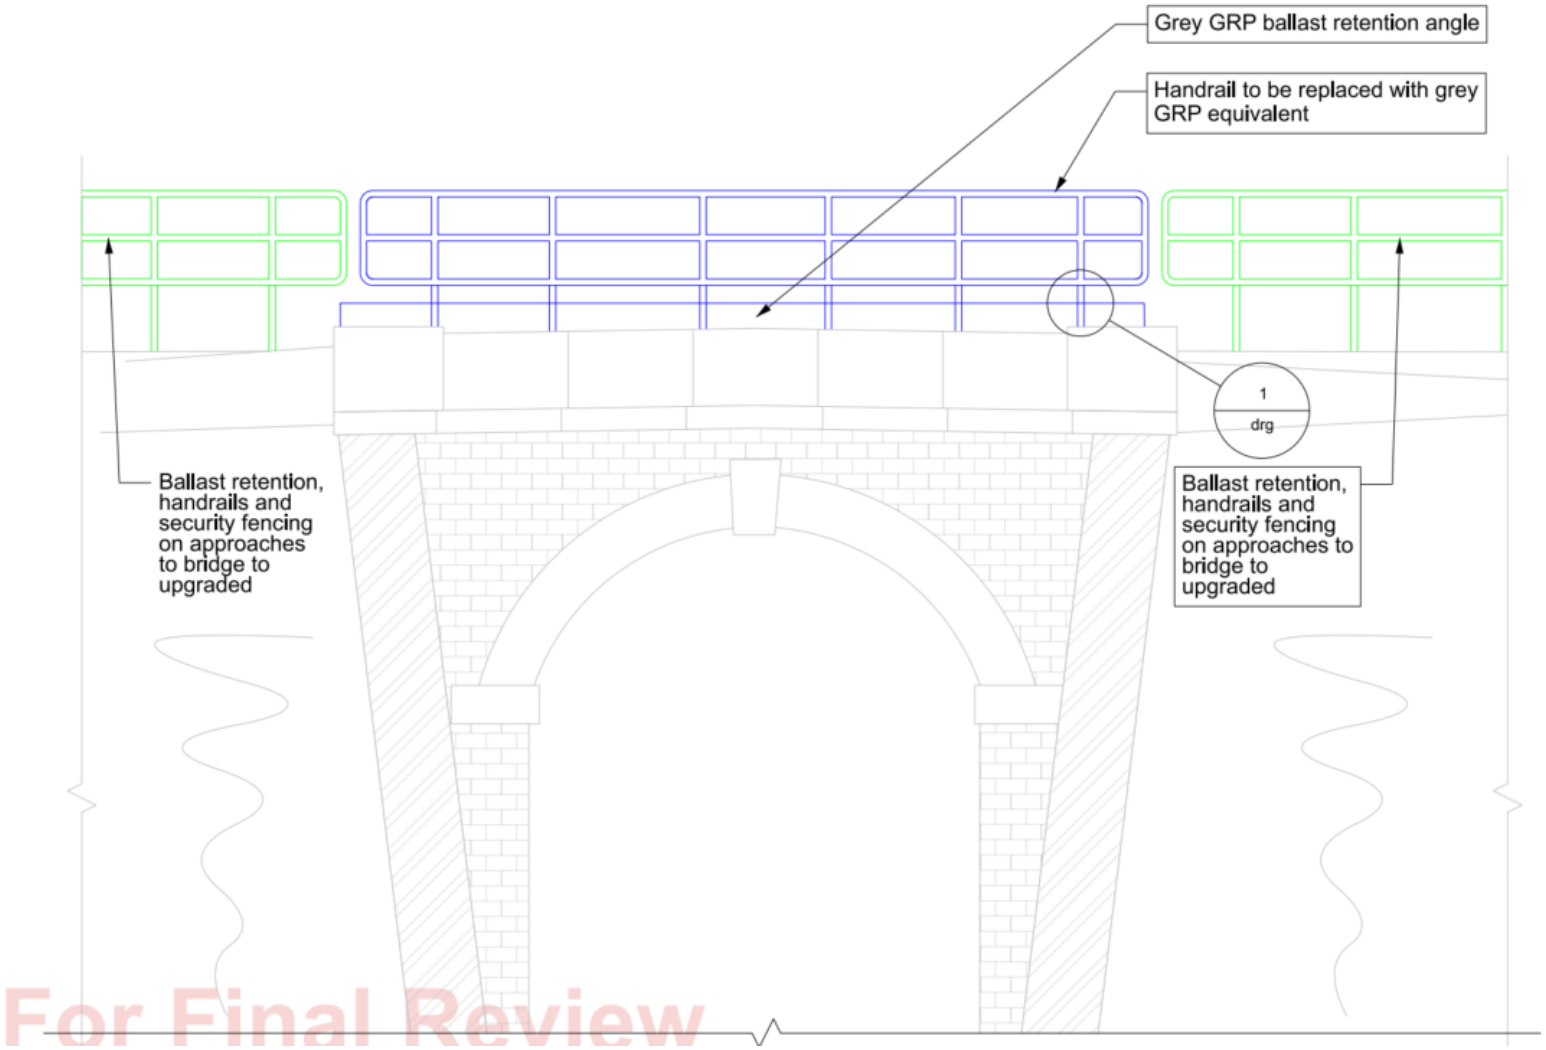
6.3 Description of proposals

6.3.1 In order to achieve the aims of the TRU programme it is necessary to re-align the track over Wickens Underbridge (MVL3/29), to increase ballast depth and to strengthen the structure to accommodate increased loading resulting from increased line speed and heavier trains (Insert 6-1 and Insert 6-2). It is also proposed to replace the existing modern handrail in compliance with Network Rail safety standards.

[3] The delivery of railway investment programmes is managed by Network Rail through the use of PACE (Project Acceleration in a Controlled Environment). This provides a flexible control framework for the delivery of rail projects. Under PACE, ES3 comprises optioneering and identification of a single design option, whilst ES4 is approval of design in principle.

6.3.2 The alterations to the listed bridge would comprise the adjustment of the existing track bed on both railway lines to lean into the new line speed. Two precast reinforced 'L' units would be installed to the inside of the underbridge parapets, below ballast level. Grout infill to the rear of the precast reinforced units and sand/cement bedding underneath would secure these in place and would not require drilling into the stone parapet or the stone arch below. An in-situ concrete stitch would be installed between the precast reinforced units to help further secure these. These measures would enable the precast reinforced units to perform as a singular structural unit, increasing the strength of the structure and relieving the load from the existing parapets.

6.3.3 The existing tubular metal 'kee klamp' type barrier will be replaced with a grey tubular GRP which will be installed ahead of the electrification of the railway to comply with Network Rail safety standards. These will be attached to the structure by means of stainless steel anchors, resin-fixed into the stone. Holes from the existing fittings would be made good using mortar, colour-matched to the surrounding stone. This will not result in any appreciable visual change to the structure given that the new handrail will follow the same height as the existing.



For Final Review

For F
NOT FOR

Insert 6-2 Proposed west elevation Wickens Underbridge (MVL3/29)

Construction Methodology

6.3.4 The proposed works to Wickens Underbridge (MVL3/29) will comprise the following:

- Temporarily divert signalling and telecom (S&T) cables on top of the parapet.
- Install lateral restraint to outside of parapet if required.
- Remove track from the Up and Down line.
- Excavate ballast using tracked excavator
- Prepare sand/cement bed ahead of placing precast reinforced concrete units.
- Install precast reinforced units using tracked excavator.
- Fix precast reinforced units and install concrete stitch along centre of precast reinforced concrete units.
- Backfill in-situ grout to rear of precast reinforced units.
- Anchor GRP angle resin into concrete with stainless steel fixings to provide ballast retention.
- Reinstate ballast, S&T cables, and track.
- Replace handrails with GRP equivalent.

6.3.5 The proposed works to Wickens Underbridge (MVL3/29) are shown in the following drawings which accompany this application:

- Existing and Proposed Plan (167037-TGP-26-MVL3-DRG-T-LP-162902); and
- Existing and Proposed Elevation and Section (167037-TGP-26-MVL3-DRG-T-LP-162903).

7. IMPACT OF PROPOSALS

7.1 Wickens Underbridge (MVL3/29)

7.1.1 The proposed works to the grade II listed Wickens Underbridge (MVL3/29) are required in order to safeguard the structure ahead of the upgrade of the line as part of the TRU Programme. These works would result in permanent minor alterations to the underbridge due to the installation of precast reinforced units and new GRP handrails.

7.1.2 Though the installation of reinforced concrete strengthening to the bridge deck and parapets would result in a permanent addition to the underbridge, this would be located on the inside of the bridge deck and substantially below ballast level. The strengthening units would

be secured in place using grout infill and sand/cement bedding, avoiding the need to fix into the masonry parapets. Though these works would result in some minor intervention into the existing underbridge, it would enable for retention of the entire underbridge and would result in only slight physical impacts to the historic fabric.

7.1.3 The proposed reinforced concrete units have been sensitively and sympathetically developed to minimise visual impact on the listed underbridge. Whilst the majority of the precast reinforced concrete units would be located below ballast level on the bridge deck, the top portion of these would rise above the ballast along the inside elevation of the parapets and would be visible only from the bridge deck. These would, however, not be visible in views of the external bridge elevations. The design for the reinforced concrete units would retain the ability to appreciate the overall historic form, features and legibility of the underbridge which contributes towards its overall significance. Whilst the ballast retention angles would slightly protrude above the parapets, these would form very small elements in the elevations and would not be prominent or intrusive. Elements of interest recognised by Historic England, including the ashlar impost bands, voussoirs, rock-faced stonework and splayed wing walls, would be wholly retained and unaltered. Given the nature of these works, there would be very limited visual impact to the structure which would not detract from its aesthetic value.

7.1.4 The proposed works for the replacement of the existing modern handrails with new GRP handrails would result in some, albeit very light tough, localised physical impact to the masonry parapet. Whilst the handrail will be doweled into existing fixing locations where possible, additional cores into the masonry parapet may be required to fix the new handrail into place. Where existing cores are not used, these will be infilled with mortar, colour-matched to the surrounding fabric to makes good these areas. These works will have negligible visual impact as the new handrails would match existing, maintaining the current appearance of the bridge.

7.1.5 Wickens Underbridge (MVL3/29) derives significance from its association with the historic railway and engineer A.S. Jee, its construction within the Heroic Age (1841-1850) of railway building, and the quality of its architectural design. Though these works would introduce contemporary materials, they would result in only slight physical and visual changes which would not detract from its design, which is a major contributing factor to its significance. Following the implementation of proposals, the historic value derived from associations with the Heroic Age of railway building and, A.S. Jee would continue to be understood and continue to contribute towards the underbridge's overall significance.

7.1.6 Wickens Underbridge (MVL3/29) does not derive particular significance from its setting, save for its relationship with the historic operational railway. The proposed works would not result in any appreciable change to the relationship between the underbridge and the railway.

7.1.7 Wickens Underbridge (MVL3/29) also derives significance from its group value with other A.S. Jee structures which share a common design language identifiable across parts of the Huddersfield & Manchester Railway, and particularly Heyrod Hall Overbridge (MVL3/7), Springbank Lane Overbridge (MVL3/9), Roughtown Road Overbridge (MVL3/17), Roughtown Road Overbridge (MVL3/17), Wright's Mill Overbridge (MVL3/20) and Wright's Overbridge (MVL3/23). The proposed works would not have any impact on the ability to appreciate its group value given that the historic form, architectural quality of Jee's design and contribution as part of the historic railway would not be impacted. The proposals have been devised with an appreciation for their group value by ensuring the appearance of the new precast reinforced units and GRP handrails are sensitively incorporated into the historic underbridge.

7.1.8 The proposals would therefore result in less than substantial harm at the lower end of the scale as stated in the pre-application advice provided by Historic England on 29 November 24.

7.2 Other heritage assets

7.2.1 Due to the minor nature of the works, the proposals would not result in any impact to any surrounding non-designated heritage assets

7.2.2 The Uppermill Conservation Area is located to the east of Wickens Underbridge (MVL3/29). However, it is not anticipated that these works would have an impact on the character and appearance of the conservation area given that it is significantly screened, and the underbridge does not contribute to its setting, character or appearance.

7.3 Mitigation

7.3.1 The design proposals have been developed to minimise impacts on the fabric, form and appearance of Wickens Underbridge (MVL3/29). This has been achieved through the design development, undertaken in consultation with Historic England and OMBC. Measures incorporated into the design to mitigate impacts on the significance of the underbridge include:

- Ensure the continued viable use of the structure as a part of the TRU network, and to safeguard it ahead of the electrification of the railway.
- Placement of precast reinforced units on the inside of the bridge deck to minimise visual and physical interventions into the historic structure.
- Replace the current modern handrails to match the appearance of the existing fittings.

7.3.2 In addition to these measures, Toolbox Talks would be undertaken in advance of construction works to Wickens Underbridge (MVL3/29). These talks would disseminate best practice for reducing potential impacts in relation to construction activities, for example to help avoid accidental damage.

Recommended compensation

7.3.3 In addition to these embedded measures, additional mitigation secured through the use of listed building consent conditions is recommended comprising:

- A scheme of historic building recording to Level 1 in accordance with Historic England guidance (Historic England, 2016). This would provide a permanent record of Wickens Underbridge (MVL3/29) in its current form and would be lodged with the Greater Manchester Historic Environment Record.
- A scheme of permanent heritage interpretation would be developed and installed adjacent to Greenfield Station. This would provide the opportunity to engage members of the public with the heritage of the Huddersfield & Manchester Railway including the historic structures designed by A. S. Jee, such as Wickens Underbridge (MVL3/29). Further engagement with stakeholders with respect to the content of the interpretation would be undertaken during the detailed design phase.

7.4 Public Benefit

7.4.1 The works proposed to be undertaken to Wickens Underbridge (MVL3/29) are required to ensure the realisation of the substantial public benefits of the Order Scheme.

7.4.2 As part of the wider TRU Programme, the Order Scheme would directly and indirectly play a role in improving regional connectivity and enhancing of some of Britain's busiest rail network, in turn realising economic, social and environmental objectives of the programme. The Transpennine route is identified as a key transport corridor, providing connections between cities in the North of

England. The improvements in connectivity delivered by the TRU programme will support aspirations for economic growth and "levelling up" opportunities across the North of England.

7.4.3 The key objectives of the TRU programme are to achieve the part electrification of the Transpennine Route, improve journey times and capacity between key destinations, improve overall reliability and resilience of the route, and provide environmental benefits from modal shift from road to rail freight, reducing the number of heavy vehicles on the highway network and associated air pollution. The completion of the proposed works to strengthen Wickens Underbridge (MVL3/29), would contribute towards delivering increases in line speed, capacity and resilience.

7.4.4 Electrification would deliver faster journey times and improved performance by allowing trains to accelerate faster, and brake more efficiently. The Order Scheme will deliver faster line speeds (80 mph throughout), improving journey times along the Transpennine Route, aiming to provide an improved journey time from Leeds – Manchester Victoria of 42-44 minutes and York to Manchester Victoria of 65-67 minutes. Works to the track and structures along the Route, including Wickens Underbridge (MVL3/29), are required to accommodate this increase, and without these changes the Scheme would be unable to go ahead.

7.4.5 As a vital constituent part of the Order Scheme, the proposed works to Wickens Underbridge (MVL3/29) would also facilitate indirect benefits associated with the wider programme of works, including station upgrades, track renewal and signalling improvements.

7.4.6 The reliability and resilience of the route and services operating on it will be improved by replacement of existing infrastructure with electrification equipment, new track drainage and signalling. Modern signalling equipment will reduce the headway between trains, allowing them to run closer together which will in turn provide increased capacity. The Scheme will provide the capability to operate four 'express', two 'semi-express' services and up to two local services an hour on the Route and will provide increased flexibility to timetable more train paths.

7.4.7 Electrification of the Scheme would provide substantial environmental and sustainability benefits and is an investment in 'greener' energy technology. This supports Network Rail's Decarbonisation Strategy and is bolstering national targets for reducing harmful emissions that cause climate change, which are set out in Government legislation for achieving net zero carbon by 2050.

7.4.8 The Order Scheme will also deliver improved safety through measures including replacement of two level crossings, installation of additional safety measures on existing bridges; enhancements to the local highway networks and new pedestrian crossing points at locations including Greenfield and Mossley Stations. Accessibility of the railway network will also be improved with the provision of fully accessible stations at Greenfield Station and the relocated Mossley Station. These measures are being brought forward as part of the wider TRU Scheme to electrify and modernise the Route, as facilitated, in part, by the works to Wickens Underbridge (MVL3/29).

7.4.9 Significant residual beneficial effects arising from the operation of the wider TRU Scheme have been previously identified in the Huddersfield-Westtown TWA Order Inquiry from December 2021. These included recognition of improved journey times, reliability, and capacity at the Local Authority area and in turn the sub-regional and regional level. These improvements will bring direct significant benefits to local businesses and the labour market through improved access to the local regions along the section of the route from Stalybridge to Diggle.

7.4.10 To this effect, the proposals at Wickens Underbridge (MVL3/29) are therefore essential in achieving the overall substantial public benefits of Route Section W2B and wider objectives of the Order Scheme, and without these interventions, the Order Scheme would not be able to be safely and successfully implemented. Alongside these substantial public benefits, the delivery of heritage interpretation adjacent to Greenfield Station would enable public engagement with the heritage of the Huddersfield & Manchester Railway, its architecture and significance.

8. CONCLUSION

8.1.1 The significance of Wickens Underbridge (MVL3/29) lies primarily in its historic and architectural interest. The underbridge is a largely unaltered example of a masonry underbridge dating to the Heroic Age (1841-1850) of railway building. The underbridge derives significance from its direct historic relationship with the notable railway engineer A.S. Jee and the historic railway companies namely the Huddersfield & Manchester Railway and LNWR. The high quality of the underbridge's architecture together with the quality of workmanship, are characteristic of A.S. Jee's work recognised across the wider Huddersfield & Manchester Railway. It also retains group value as one of a number of A.S. Jee structures on the Transpennine route which share a common design language.

8.1.2 The proposals for strengthening Wickens Underbridge (MVL3/29) have been developed and undertaken in consultation with Historic

England and TMBC and have been developed to minimise the impact on the listed underbridge as far as possible. Special regard has been given to the desirability of preserving or enhancing the structure or its setting or any features of special architectural or historic interest which it possesses. The proposals therefore comprise:

- Strengthening of the bridge through installation of precast reinforced units to the inside of the ridge parapets, below ballast level;
- Attachment of parapet blocks by steel dowels; and
- Replacement of the existing kee-clamp handrail with new GRP handrails.

8.1.3 These works will result in minor alteration of the structure and will preserve key aspects that contribute to its overall significance including its architectural quality, detailing and construction. Whilst the proposals would introduce modern materials into the historic structure, these works have been developed to be as visually unobtrusive as possible. Additionally, the group value of Manchester Road Underbridge (MVL3/10) with other A.S. Jee bridges for the Huddersfield & Manchester Railway would be maintained.

8.1.4 The proposals would result in less than substantial harm to the significance of the Wickens Underbridge (MVL3/29) at the lower end of the scale, as defined under paragraph 215 of the NPPF. These impacts are necessary in order to deliver the TRU programme, and would enable the achievement of key improvement objectives as outlined in Section 7.4. It would also support the achievement of substantial public benefits related to:

- Improved efficiency and reliability of the railway (in journey time saving and increased capacity).
- Reduction of delays to trains and other highway users (improved efficiency of the railways means fewer heavy vehicles on the highway network causing traffic issues and contributing to air pollution)
- Supporting sustainable transport development in line with Network Rail's Decarbonisation Strategy.
- Improving public health and safety in providing safe routes across the railway.

8.1.5 In addition to this, the delivery of a programme of heritage interpretation at Greenfield Station would provide the opportunity for engagement of the public with the heritage of the Huddersfield & Manchester Railway.

8.1.6 These substantial public benefits would outweigh the less than substantial harm to the significance of the Wickens Underbridge (MVL3/29). These proposals therefore meet the requirements of the NPPF (paragraph 215) in relation to the justification for less than substantial harm. The proposals would also satisfy the requirements of Policy 24 of the Oldham Local Development Framework in relation to the impact on the character of the listed building, and preservation of its architectural style and features. It would also satisfy Policy JP-P2 contained within Greater Manchester Combined Authority's Places for Everyone (2024). The proposals therefore satisfy both national and local policy requirements in relation to the justification for harm to the significance of Wickens Underbridge (MVL3/29).

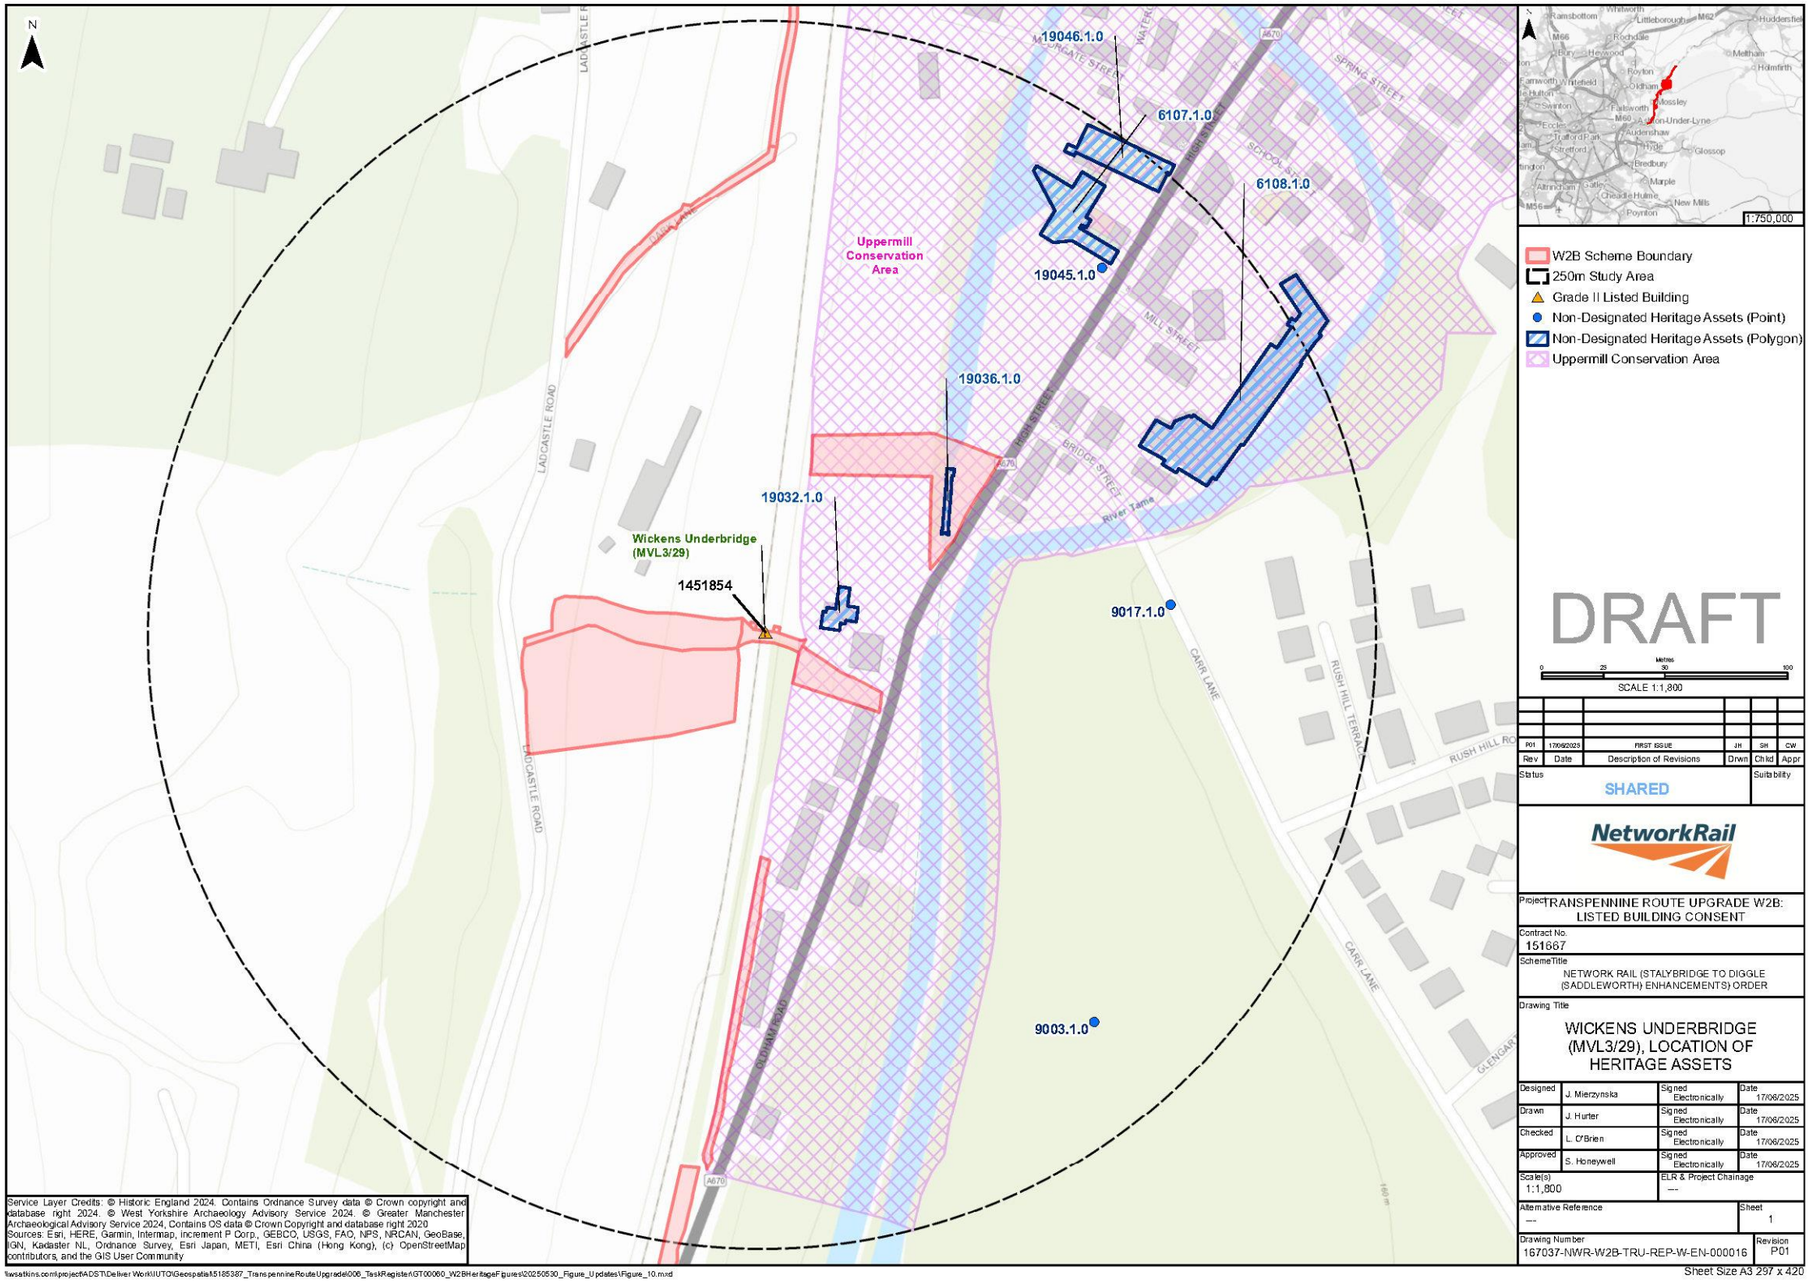
APPENDIX A – LOCATION PLAN



APPENDIX B – NATIONAL HERITAGE LIST DESCRIPTION

Official list entry

Heritage Category:	Listed Building
Grade:	II
List Entry Number:	1451854
Date first listed:	23-Mar-2018
List Entry Name:	Railway accommodation underbridge MVL3/29, Wickens
Location Description:	Oldham Road, Wickens, Upper Mill.

Location

The building or site itself may lie within the boundary of more than one authority.

District:	Oldham (Metropolitan Authority)
Parish:	Saddleworth
National Grid Reference:	SD9946505410

Summary

Accommodation underbridge for the Huddersfield & Manchester Railway. Mid-late 1840s by A S Jee.

Reasons for Designation

The accommodation underbridge MVL3/29, Wickens, constructed in the mid-late 1840s by A S Jee for the Huddersfield & Manchester Railway, is listed at Grade II for the following principal reasons:

Historic interest:

* constructed during the heroic age of railway building and a little altered example of an 1840s accommodation underbridge on what is now one of the main railway lines in northern England;

* designed by the notable railway engineer Alfred Stanistreet Jee.

Architectural interest:

* as a well-designed bridge, with good quality stone masonry and attention to architectural detail in its use of picked and tooled, v-jointed voussoirs with larger keystones, ashlar impost bands, parapets, coping and soffit and contrasting rock-faced stonework of the spandrels, abutments and raked and splayed wing walls which all lift it above the purely functional.

Group value:

* architecturally inter-related with the other listed structures designed by A S Jee on the Huddersfield & Manchester line.

History

In contrast to the main trunk lines of the late 1830s that were constructed by single railway companies, the route from Stalybridge to Leeds had fragmented origins and was the work of three different railway companies: the Huddersfield & Manchester Railway, Leeds, Dewsbury & Manchester Railway, and the Manchester & Leeds Railway.

The Huddersfield & Manchester Railway was authorised in 1845 and followed the route of the Huddersfield Narrow Canal for much of its length, including a railway tunnel through the Pennine hills set alongside the earlier Standedge Canal Company tunnel of 1811; in 1846 the railway company also acquired the canal. Joseph Locke and Alfred Stanistreet Jee were appointed to survey and design the new line, the two engineers having already worked

together on a major project linking Manchester and Sheffield. Jee became the lead engineer for the Huddersfield line, which passed through challenging terrain, assisted by resident engineers that included his brother Moreland Jee (until 1848) and Herbert F Mackworth. Construction of the line was divided into various contracts, with many contractors being only responsible for a single cutting, viaduct or tunnel portal. The largest contract for the Standedge Tunnel between Diggle and Marsden was let to a single contractor, Thomas Nicholson in 1847. The tunnel's completion in 1849 marked the opening of the line.

The Leeds end of the route, which was also authorised in 1845, was constructed by the Leeds, Dewsbury & Manchester Railway. The engineer was Thomas Grainger who had previously largely worked in Scotland, and the line was completed in 1849.

A short three-mile section of the route between Heaton Lodge Junction and Thornhill Junction near Mirfield was developed by the Manchester & Leeds Railway and was constructed between 1837 and 1840, with George Stephenson as the chief engineer. The structures on this line were designed by Thomas Gooch under the oversight of Stephenson. In 1847 the railway company changed its name to the Lancashire & Yorkshire Railway.

In 1847 the Huddersfield & Manchester Railway and the Leeds, Dewsbury & Manchester Railway were acquired by the London & North Western Railway (LNWR) so that the company could access the city of Leeds and the textile towns of West Yorkshire. This pitted them as rivals to the Lancashire & Yorkshire Railway, although at points on the route the two companies had to work together. By 1851 the London & North Western Railway had an overall mileage of railway track of 800 miles and it became the most prominent railway company in the country and the largest joint-stock concern in the world in the late C19. Although the LNWR had a general manager, Captain Mark Huish, the lines of the Stalybridge to Leeds route still managed their own affairs. LNWR later carried out expansion works, including the widening of tracks and bridges, the construction of additional tunnels, and station alterations. In 1923 the line became part of the London Midland & Scottish Railway, and subsequently part of the nationalised British Railways in 1948. The line, its structures and track are currently (2018) owned by Network Rail, and the passenger services operated by TransPennine Express and Northern Rail.

This underbridge accommodates a track beneath the railway line. It was designed by A S Jee and dates to the construction of the Huddersfield & Manchester Railway between 1845 and

1849 (the railway line is shown on the first edition 1:10,560 OS map surveyed between 1849 and 1851 and published in 1854.)

Details

Accommodation underbridge for the Huddersfield & Manchester Railway. Mid-late 1840s by A S Jee.

MATERIALS: rock-faced and ashlar sandstone (shale grit/Kinderscout grit/millstone grit).

DESCRIPTION: the accommodation bridge carries the two-track railway line over a footpath which slopes down to the south. The bridge has deep, segmental arches with v-jointed voussoirs of picked ashlar with tooled margins and slightly projecting, taller keystones with diagonal tooling. They spring from a similarly detailed, ashlar impost band. The bridge abutments and spandrels are of coursed, rock-faced stone blocks and the bridge soffit is of smaller, coursed, ashlar blocks. The ashlar parapets have a slightly projecting, square-moulded band with deeper panels above. The raked and splayed wing walls terminate in slightly projecting, rectangular piers and are of coursed, rock-faced stone blocks with square-moulded ashlar coping.

29 November 2024

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the meetings on 6 and 21 November 2024 to review the proposals for bridges MVL3/9, 10, 23, 25, 26, 28, 29 and 31. As before, it was helpful to see the drawings in advance and then talk through the proposals with the team.

The impacts of the proposed changes and our comments are detailed below:

Proposals at *Manchester Road underbridge MVL3/10*, *Shaw Hall Bank Road underbridge MVL3/26* and *Wickens underbridge MVL3/29* will involve minor works, consisting of renewal of railings and strengthening of parapets with reinforced concrete. Visually, there will be only a minor impact, as the replacement railings are similar to the existing and the concrete strengthening will be hidden from view by the parapets. There will be a very low level of less than substantial harm to the physical fabric of the bridges due to the new railings being grouted into cored holes in the masonry parapet blocks. We do not have concerns over the works at these three bridges and recognise the efforts to maintain the visual appearance on the bridges.

The proposals for *Spring Bank Lane overbridge MVL3/9* and *Uppermill Viaduct MVL3/31* have been discussed at previous meetings, and it was helpful to see further details of the works at these structures. There will be a low level of less than substantial harm to *Spring Bank Lane overbridge* due to the introduction of raised copers, however the use of colour-matched concrete here will help to mitigate some of the harm caused by the visual impact of the new copers. Works to *Uppermill Viaduct* will likewise lead to a low level of less than substantial harm due to the introduction of brackets to support the OLE portals which will have an impact both physically and visually. We appreciate that care has been taken in the spacing of these portals so the rhythm of the bridge arches is not unduly interrupted, and so that the pattress plates are not affected.

More considerable impacts will result from proposals at *Wright's overbridge MVL3/23*, *Oaklands Road underbridge MVL3/25* and *Oldham Road overbridge (Greenfield*

Historic England

Station) MVL3/28, all of which will result in substantial harm to the significance of the designated assets.

As mentioned in previous letters, the removal of *Wright's Overbridge* will cause substantial harm to its significance through the total loss of its historic form and all original fabric, and through the re-routing of a historic public footpath. Thorough justification will need to be presented in the supporting documentation to provide the reasoning for the total loss of this bridge.

The proposed reconstruction of *Oldham Road Overbridge* has also been discussed previously. This is a skew overbridge located on the north-east side of Greenfield Station which carries Oldham Road over the track below. The bridge currently has a masonry arch which will be dismantled, along with much of the approaching wing walls, resulting in very little historic fabric being retained. The works will also necessitate the removal of the ornate historic iron railway footbridge. There will be substantial harm to the significance of the listed asset due to the severity of changes to its physical appearance and the loss of historic fabric. We recognise that some fabric will be retained for reuse as cladding material, however this will need to be carefully managed to maintain the look of the structure. The stone coursing in the existing bridge runs through the parapets into the wing walls. We would like to see care taken to replicate this effect within the reconstructed bridge to avoid a disjointed appearance to the new structure, which could arise from using mismatched stone-cladded panels. The existing bridge features flat masonry pilasters that project slightly from the bridge to either side of the arch. These have not been articulated in the proposed design and we would like to see further investigation into whether they could be incorporated into the design. This location would be suitable for display of permanent interpretation materials which could help to mitigate some of the harm by informing the public about the history of the route and the upgrade works.

Oaklands Road underbridge MVL3/25 is a skew girder bridge carrying the two-track railway line over a bend in the road below. The angled abutments have distinctive semi-octagonal piers, and the parapets are ornate balustrades of decorative cast-iron panels of Gothic arcading. The craftsmanship of the stonemasonry and attention to architectural detail lifts the design of this bridge above the purely functional and it has considerable architectural interest. There will be substantial harm to the significance of this listed bridge resulting from the proposals to reconstruct and widen the bridge deck and to rebuild the octagonal piers. In order to minimise the harm, the design of the rebuilt piers and abutments will need to be careful managed to ensure there is meaningful articulation of the distinctive shape of the piers. This includes the contrasting shape and dimensions of the piers where they extend through and above the parapet. We are comfortable with the proposals to replicate the decorative cast-iron panels to minimise the visual impact of the loss of the original fabric here.

Our ref: PA01200823
18 July 2025

Dear Sarah

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the recent meetings to review the draft Heritage Statements that will be submitted for Listed Building Consent applications for changes to bridges on the proposed Transpennine Route Upgrade line.

The Heritage Statements are well considered and it is clear that alternative options to reconstruction have been investigated in each case, which are helpfully set out in tables in the reports. The proposals will result in substantial harm to listed bridges along the route, however clear justification for this has been set out in the Heritage Statements.

We very much welcome the inclusion of heritage interpretation at Greenfield Station. This is a significant early rail route and there is notable educational potential in the material that has been generated from the research into the railway structures as part of this project.

Regarding Oaklands Road underbridge MVL3/25, we are comfortable with the design of the proposals for the reconstruction of the parapet and stone turrets. These have been carefully considered to minimise the visual impact.

Next Steps

We appreciate having been involved at pre-application stage in this important project, and value being able to feed into design plans. If you require further pre-application advice please get in touch.

Yours sincerely

1. INTRODUCTION

1.1 Transpennine Route Upgrade

1.1.1 The Transpennine Route Upgrade (TRU) is a major, multi-billion pound program of improvements to increase capacity, improve journey time and reliability performance of rail services on the Transpennine Route.

1.1.2 The TRU will aim to deliver:

- An improved journey time for Leeds – Manchester Victoria of 42-44mins;
- An improved journey time for York to Manchester Victoria of 65-67mins;
- Capability to operate four 'express' and two 'semi-express' services an hour;
- Capability to operate up to two 'local services' an hour on the route;(subject to future operating timetables);
- Performance of the Transpennine Route to be 92.5% or higher each period;
- Larger freight containerisation capability (W12 gauge);
- Freight paths/rights to be retained as existing; and
- A contribution to Network Rail's Decarbonisation Strategy and climate policy.

1.1.3 The Network Rail (Stalybridge to Diggle (Saddleworth) Enhancements) Order extends from Stalybridge Tunnel, in the west, through to the western portal of Standedge Tunnel (the "Order Scheme"). This section of the Transpennine route is referred to hereafter as Route Section W2B

1.1.4 The TRU programme in Route Section W2B involves a variety of works including the electrification of the railway (installation of overhead line equipment (OLE) and associated infrastructure); reconstruction and modification of existing bridges to facilitate electrification of the railway, construction of a new station at Mossley, closure of Stockport Road Level Crossing and Moorgate Halt Level Crossing, railway works at Greenfield Station to support the upgrade and electrification of the railway track reconfiguration works and track lowering works through Stalybridge and Scout Tunnels.

1.1.5 Under the Planning (Listed Buildings and Conservation Areas) Act 1990, consent is required from the local planning authority for any proposed works that would affect the character of a listed building.

The Transport and Works Act 1992 introduced section 12(3A) into the Planning (Listed Buildings and Conservation Areas) Act 1990, the effect of which is to "call-in" for determination by the Secretary of State applications to the local planning authority for listed building consent where such consent is required in consequence of proposals included in an application for a Transport and Works Act Order (TWAO). The procedures in the Transport and Works Applications (Listed Buildings, Conservation Areas and Ancient Monuments Procedure) Regulations 1992 then apply to the call in of such listed building consent applications.

1.1.6 This Heritage Statement has been compiled in support of an application for listed building consent by Network Rail in respect of the proposed works on the grade II listed Uppermill Viaduct (MVL3/31) (NHLE 1068120). This bridge is located in Uppermill (NGR SD 99579 06310), Oldham. A location plan is provided in Appendix A.

1.1.7 The preparation of this assessment has been informed by the Statement of History and Significance: West of Leeds (Alan Baxter Associates 2024) and the Route-wide Statement of Significance (Alan Baxter Associates 2019).

1.2 Scope

1.2.1 The requirement for assessment and its scope is guided by policy contained within the National Planning Policy Framework (NPPF, 2025) specifically paragraph 207, which seeks an assessment proportionate to the importance of the affected heritage asset sufficient to understand the potential impacts of development. The specific scope of this assessment is determined by Network Rail's requirement to provide an objective assessment of the heritage value of assets that may be affected by the Order Scheme, and to appraise the nature and extent of any impact upon setting and significance.

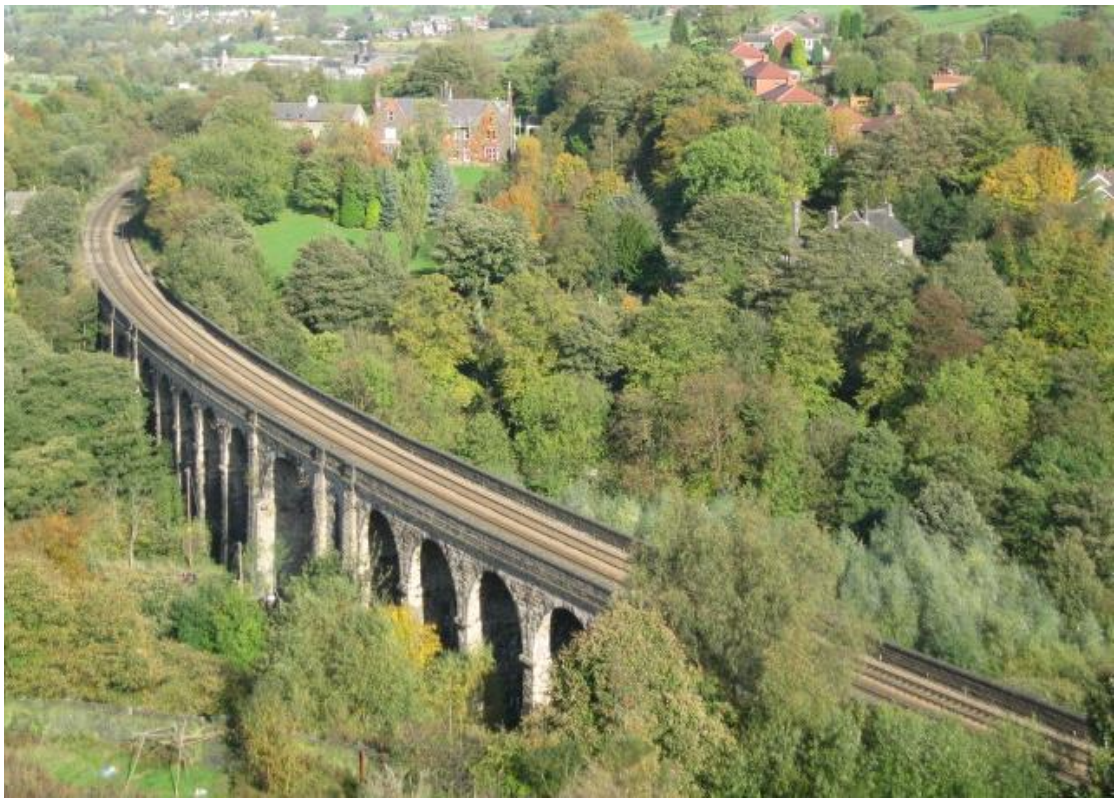
1.2.2 This Heritage Statement will:

- Identify and discuss the heritage significance of the listed structure, including the contribution of setting;
- Present the design requirements of the Order Scheme at the structure;
- Present the process of development and optioneering which has led to the design proposal for the Order Scheme in relation to the structure;
- Identify the impacts of the design proposal on the significance of the structure, in the context of current national and local planning policy and guidance;

- Discuss any mitigation recommended in relation to the structure; and
- Consider the public benefits to be gained from the Order Scheme weighed against the impact on the significance of the structure, in line with the National Planning Policy Framework, 2025 and the Oldham Local Development Framework (2011).

1.3 Current Condition

1.3.1 Uppermill Viaduct (MVL3/31) (Insert 1-1) is a mid to late 1840s masonry viaduct of 23 spans, designed by Alfred Stanistreet (A.S.) Jee for the Huddersfield & Manchester Railway. It carries the Transpennine railway across the River Tame valley to the north-west of the settlement of Uppermill, located c. 7km east of Oldham, Greater Manchester. The structure spans the A370 High Street, Den Lane and Brownhill Lane, as well as the watercourses of the Huddersfield Narrow Canal and the River Tame.



Insert 1-1 Uppermill Viaduct (MVL3/31), viewed from the south.

1.3.2 The structure was subject to a detailed examination as part of Network Rail's maintenance regime in November 2011, which identified that the viaduct is in an overall fair condition. A more recent visual inspection in March 2020 identified no change in the overall condition

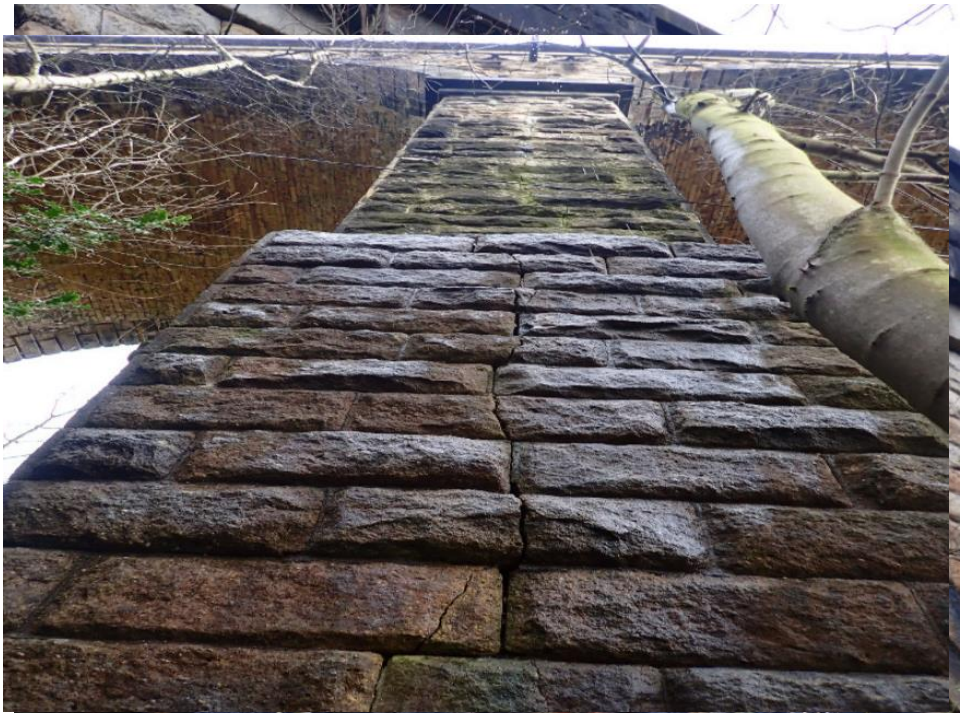
of the structure since the detail inspection. A number of small defects were identified, including:

- Open joints in the masonry elevations;
- A number of small vertical and transverse fractures in piers and buttresses (Insert 1-2);
- Vegetation infiltrating through spandrel walls and parapets (Insert 1-3);
- Isolated examples of displacement or dropped masonry in some arch barrels and buttresses; and
- Minor corrosion of pattress plates.

1.4 Summary of Proposal

1.4.1 In order to achieve the TRU Programme objectives, electrification of the Route is required. This would require the alteration of a number of existing structures, including Uppermill Viaduct (MVL3/31), in order to accommodate OLE, higher line speed and increased freight trains. It has been determined to be necessary to undertake works to Uppermill Viaduct (MVL3/31) in order to accommodate provisions for OLE portals. These works will therefore enable implementation of the Order Scheme.

Insert 1-2 Example of a typical vertical fracture in one of the arch piers.



Insert 1-3 Example of typical vegetation around one of the downpipe hoppers.

2. LEGISLATION AND POLICY CONTEXT

2.1 Legislation

2.1.1 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) (the "Act") governs the designation and works to listed buildings in England.

2.1.2 The Act states in s.1 (5):

'In this Act "listed building" means a building which is for the time being included in a list compiled or approved by the Secretary of State under this section; and for the purposes of this Act—

a. any object or structure fixed to the building;

b. any object or structure within the curtilage of the building which, although not fixed to the building, forms part of the land and has done so since before 1st July 1948, shall be treated as part of the building.'

2.1.3 Under the Act, no one is permitted to undertake or cause to be undertaken any works that would affect the character of a listed building unless the works are authorised. Section 16 of the Act identifies that whether such works can be carried out is determined by the local planning authority or the Secretary of State:

1) 'Subject to the previous provisions of this Part, the local planning authority or, as the case may be, the Secretary of State may grant or refuse an application for listed building consent and, if they grant consent, may grant it subject to conditions.

2) In considering whether to grant listed building consent for any works the local planning authority or the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses.

3) Any listed building consent shall (except in so far as it otherwise provides) ensure for the benefit of the building and of all persons for the time being interested in it.'

2.1.4 In relation to the granting of listed building consent, Section 17 of the Act stipulates that conditions attached to listed building consent may include those with respect to:

a) 'the preservation of particular features of the building, either as part of it or after severance from it;

b) the making good, after the works are completed, of any damage caused to the building by the works; [and]

c) the reconstruction of the building or any part of it following the execution of any works, with the use of original materials so far as practicable and with such alterations of the interior of the building as may be specified in the conditions'.

2.1.5 It is also defined in s.17 (2) that a condition '*may also be imposed requiring specified details of the works (whether or not set out in the application) to be approved subsequently by the local planning authority or, in the case of consent granted by the Secretary of State, specifying whether such details are to be approved by the local planning authority or by him'*.

2.1.6 The Act also states in s.66 (1):

'In considering whether to grant planning permission or permission in principle for development which affects a listed building or its setting, the local planning authority or, as the case may be, the Secretary of State shall have special regard to the desirability of preserving or enhancing the building or its setting or any features of special architectural or historic interest which it possesses'.

2.1.7 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) also governs duties of the local planning authority relating to conservation areas, particularly Sections 69, 72 and 74.

2.1.8 Section 69 requires local planning authorities to define as conservation areas any '*areas of special architectural or historic interest the character or appearance of which it is desirable to preserve or enhance'*.

2.1.9 Section 72 confers a general duty '*with respect to any buildings or other land in a conservation area… special attention shall be paid to the desirability or preserving or enhancing the character or appearance of that area*'.

2.1.10 Section 74 defines that demolition of a building in a conservation area is not permitted 'without the *consent of the appropriate authority'.*

2.2 National Policy

2.2.1 The National Planning Policy Framework (NPPF, 2025) sets out the Government's planning policies for England and how these should be applied to contribute to the achievement of sustainable development, supported by the Planning Practice Guidance (updated July 2019) (MHCLG, 2019).

2.2.2 Section 2 of the NPPF outlines the principles of achieving sustainable development including, in Paragraph 8, an environmental objective '*to protect and enhance our natural, built and historic environment*'. Paragraph 9 sets out that these objectives should be delivered

through the preparation and implementation of plans and the application of the policies within the NPPF. Section 16 of the NPPF deals specifically with the historic environment. Where changes are proposed, the NPPF sets out a clear framework to ensure that heritage assets are conserved, and where appropriate enhanced, in a manner that is consistent with their significance

2.2.3 The following paragraphs as set out in the NPPF include key provisions considered of particular importance to this application:

- Paragraph 207 – '*In determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand the potential impact of the proposal on their significance*.'
- Paragraph 212 – '*When considering the impact of a proposed development on the significance of a designated heritage asset, great weight should be given to the asset's conservation (and the more important the asset, the greater the weight should be). This is irrespective of whether any potential harm amounts to substantial harm, total loss, or less than substantial harm to its significance*.'
- Paragraph 213 – '*Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification. Substantial harm to or loss of:*

    a) grade II listed buildings, or grade II registered parks or gardens, should be exceptional;

    b) assets of the highest significance, notably scheduled monuments, protected wreck sites, registered battlefields, grade I and II listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional.'*

- Paragraph 214 – '*Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss, or all of the following apply*:

    a) the nature of the heritage asset prevents all reasonable uses of the site; and

b) no viable use of the heritage asset itself can be found in the medium term through appropriate marketing that will enable its conservation; and

c) conservation by grant-funding or some form of not for profit, charitable or public ownership is demonstrably not possible; and

d) the harm or loss is outweighed by the benefit of bringing the site back into use.'

- Paragraph 215 – '*Where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate, securing its optimum viable use*.'
- Paragraph 216 – '*The effect of an application on the significance of a non-designated heritage asset should be taken into account in determining the application. In weighing applications that directly or indirectly affect non-designated heritage assets, a balanced judgment will be required having regard to the scale of any harm or loss and the significance of the heritage asset*.'
- Paragraph 219 **–** ***'Local planning authorities should look for opportunities for new development within Conservation Areas and World Heritage Sites, and within the setting of heritage assets, to enhance or better reveal their significance. Proposals that preserve those elements of the setting that make a positive contribution to the asset (or which better reveal its significance) should be treated favourably***.'
- Paragraph 220 **–** ***'Not all elements of a Conservation Area or World Heritage Site will necessarily contribute to its significance. Loss of a building (or other element) which makes a positive contribution to the significance of the Conservation Area or World Heritage Site should be treated either as substantial harm under paragraph 214 or less than substantial harm under paragraph 215, as appropriate, taking into account the relative significance of the element affected and its contribution to the significance of the Conservation Area or World Heritage Site as a whole***.'

Planning Practice Guidance

2.2.4 The Planning Practice Guidance (PPG) (MHCLG, 2019) provides further advice and guidance that expands the policy outlined in the NPPF. It expands on terms such as 'significance' and its importance in decision making. The PPG clarifies that being able to properly assess the nature, extent and the importance of the significance of the

heritage asset and the contribution of its setting, is very important to understanding the potential impact and acceptability of development proposals (paragraph 008 Reference ID: 18a-008-20190723).

2.2.5 The PPG states that in relation to setting, a thorough assessment of the impact on setting needs to take in to account, and be proportionate to, the significance of the heritage asset under consideration and the degree to which proposed changes enhance or detract from that significance and the ability to appreciate it (paragraph 009 Reference ID: 18a-009-20190723).

2.2.6 The extent and importance of setting is often expressed by reference to visual considerations. Although views of or from an asset will play an important part, the way in which an asset is experienced in its setting is also influenced by other environmental factors such as noise, dust and vibration from other land uses in the vicinity, and by our understanding of the historic relationship between places.

2.2.7 Paragraph 013 of the PPG recognises that the contribution that setting makes to the significance of the heritage asset does not depend on there being public right or the ability to experience that setting. When assessing any application for development which may affect the setting of a heritage asset, local planning authorities may also need to consider the implications of cumulative change (Paragraph: 013 Reference ID: 18a-013-20190723 Revision date: 23 07 2019).

2.2.8 In relation to substantial harm, the PPG states that 'it is the degree of harm to the asset's significance rather than the scale of the development that is to be assessed' (paragraph 017). Harm to heritage assets can be avoided or minimised if proposals are based on a clear understanding of the heritage asset and its setting (paragraph 008 Reference ID: 18a-008-20190723). The NPPF indicates that the degree of harm should be considered alongside any public benefits that can be delivered by development.

2.3 Local planning policy

<u>Oldham Local Development Framework</u>

2.3.1 Local planning policy for Oldham is provided by the Joint Core Strategy and Development Management Policies of the Oldham Local Development Framework, adopted in November 2011, and a small number of retained policies from the Unitary Development Plan (2009).

2.3.2 Policy 24 of the Local Development Framework relates to the Historic Environment and is reproduced in full below:

Policy 24 Historic Environment

'Oldham has a rich historic environment with many significant and valuable features, structures and characteristics. The council will protect, conserve and enhance these heritage assets and their settings which adds to the borough's sense of place and identity.

Development proposals must have regard to:

- *National and local guidance and policies on the historic environment.*
- *Oldham Rochdale Housing Market Renewal Pathfinder Heritage Assessments.*
- *Greater Manchester and Oldham Urban Historic Landscape Characterisation Study.*
- *Conservation Area Appraisals and Management Plans, where appropriate.*

When allocating sites and determining applications for planning and advertisement consents, the council will seek to protect, conserve and enhance the architectural features, structures, settings, historic character and significance of the borough's heritage assets and designations including:

- *Listed buildings.*
- *Conservation areas.*
- *Registered parks and gardens (their historic character and setting).*
- *Scheduled ancient monuments (their archaeological value and interest).*
- *Significant archaeological remains.*

a. Locally significant buildings, structures, areas or landscapes of architectural or historic interest (including non-designated locally significant assets identified in the local lists compiled by the council).

The council will support heritage-led regeneration, including the reuse of historic buildings such as mills, to achieve economic, community and regeneration objectives, where appropriate.

Listed Buildings

Development to, or within the curtilage or vicinity of, a listed building or structure must serve to preserve or enhance its special interest and its setting. There will be a strong presumption against proposals involving the demolition of listed buildings or structures. Proposals which would lead to the loss or cause harm to grade I and II listed buildings should be wholly exceptional. Development proposals for a building incorporating a historic shop front should make provision for its retention, restoration and repair.*

Conservation Areas

Development within or affecting the setting of a conservation area, including views in or out, must serve to preserve or enhance the character or appearance of the area. Proposals for all new development, including alterations and extensions to buildings and their re-use, must have a sensitive and appropriate response to context and good attention to detail. Proposals must not adversely affect important architectural or historic features or distinctive local features or structures unless it can be demonstrated that the development brings substantial benefits to the community. Proposals for the demolition of a building in a conservation area must demonstrate that it is unrealistic for the building to continue in its existing use and a suitable alternative use cannot be found, or the building is in poor structural condition and the cost of repairing and maintaining it would be disproportionate to its importance and value and the demolition would preserve or enhance the character or appearance of the conservation area. In exceptional circumstances, the fact that a demolition would bring substantial benefits to the local community may outweigh the balance in favour of the preservation of the building.

Registered Parks and Gardens

Development which would lead to the loss of, or cause harm to, the historic character or setting of any part of registered park and garden will not be permitted.

Scheduled Monuments

Development which would lead to the loss of, or cause harm to, scheduled ancient monuments should be wholly exceptional.

Local Designations

Development which would affect the following designations will only be permitted in cases where it can be demonstrated that the benefits of the development brings substantial benefits to the community which outweigh the preservation of the heritage asset:

Significant archaeological remains.

Locally significant buildings, structures, areas or landscapes of architectural or historic interest'.

Places for Everyone

2.3.3 Places for Everyone (Greater Manchester Combined Authority 2024) is a joint development plan covering nine Greater Manchester districts including Oldham, setting out a framework for sustainable development. Policy JP-P2 concerns Heritage and is of relevance to this assessment:

Policy JP-P2: Heritage

We will proactively manage and work with partners to positively conserve, sustain and enhance our historic environment and heritage assets and their settings. Opportunities will be pursued to aid the promotion, enjoyment, understanding and interpretation of heritage assets, as a means of maximising wider public benefits and reinforcing Greater Manchester's distinct character, identity and sense of place.

Local Plans will set out the key elements which contribute to the district's identity, character and distinctiveness and which should be the priority for conserving and enhancing in the future and demonstrate a clear understanding of the historic environment and the heritage values of sites, buildings or areas and their relationship with their surroundings. This

knowledge should be used to inform the positive management and integration of our heritage by:

1. *Setting out a clear vision that recognises and embeds the role of heritage in place-making;*

2. *Ensuring that the heritage significance of a site or area is considered in accordance with national planning policy in the planning and design process and opportunities for interpretation and local engagement are optimised;*

3. *Integrating the conservation and enhancement of heritage assets and their settings, with creative contextual architectural responses that contribute to their significance and sense of place;*

4. *Delivering positive benefits that sustain and enhance the historic environment, as well as contributing to the economic viability, accessibility and environmental quality of a place, and to social wellbeing; and*

5. *Exploring opportunities to reduce greenhouse gas emissions that restoration of historic buildings offer.*

Particular consideration will be given to ensure that the significance of key elements of the historic environment which contribute to Greater Manchester's distinctive identity and sense of place are protected from harm. These include historic town centres, places of worship, historic transport routes including the canal network, industrial buildings and structures including textile mills, farmsteads and other sites, buildings, and areas of identified archaeological, architectural, artistic and/or historic value. Development proposals affecting designated and non-designated heritage assets and/or their settings will be considered having regard to national planning policy. Where heritage assets have been identified as being at risk, Local Plans should identify specific opportunities for them to contribute to regeneration and place-making, and they should set out strategies for their repair and re-use. Development proposals which will help safeguard the significance of and secure a sustainable future for Greater Manchester's

heritage at risk will be supported in principle, provided they are not contrary to national policy or other policies in the development plan. Proposals should be informed, as necessary, by the findings and recommendations of the appropriate heritage assessment(s) in the development plan evidence base and/or any updated heritage assessment submitted as part of the planning application process.

Historic England Guidance

2.3.4 Historic England has published a series of Good Practice Advice (GPA) notes and Advice Notes (AN) of which those of most relevance to this appraisal are GPA2 – Managing Significance in Decision-taking (Historic England, 2015), GPA3 – The Setting of Heritage Assets (Historic England, 2017), and AN12, Statements of Heritage Significance (Historic England, 2019).

2.3.5 GPA2 – Managing Significance in Decision-taking emphasises the importance of having a knowledge and understanding of the significance of heritage assets likely to be affected by the development and that the 'first step for all applicants is to understand the significance of any affected heritage asset and, if relevant the contribution of its setting to its significance' (paragraph 4). Early knowledge of this information is also useful to a local planning authority in pre-application engagement with an applicant and ultimately in decision making (paragraph 7).

2.3.6 GPA3 – The Setting of Heritage Assets provides advice on the setting of heritage assets. Setting is as defined in the NPPF and comprises the surroundings in which a heritage asset is experienced. Elements of a setting can make positive or negative contributions to the significance of an asset and affect the ways in which it is experienced. Historic England state that setting does not have a boundary and what comprises an asset's setting may change as the asset and its surrounding evolve. Setting can be extensive and particularly in urban areas or extensive landscapes can overlap with other assets. The contribution of setting to the significance of an asset is often expressed by reference to views and the GPA in paragraph 11 identifies those views, such as those that were designed or those that were intended, that contribute to understanding the significance of assets.

2.3.7 AN12, Statements of Heritage Significance outlines a recommended approach to assessing the significance of heritage assets in line with the requirements of NPPF. It includes a suggested reporting structure for a 'Statement of Heritage Significance', as well as guidance on creating a statement that is proportionate to the asset's significance

and the potential degree of impact of a proposed development. The AN also offers an interpretation of the various forms of heritage interest that an asset can possess, based on the terms provided in the NPPF Glossary (Annex 2); namely archaeological, architectural, artistic, and historic.

3. ASSESSMENT METHODOLOGY

3.1 Research

3.1.1 In accordance with Historic England guidance and as determined by policy requirements, this assessment identifies the baseline heritage interest of Uppermill Viaduct (MVL3/31). The historical narrative informing the baseline has been derived from a review of various resources including maps and other cartographic and photographic sources. Statutory information in relation to the designated assets has been obtained from the National Heritage List for England maintained by Historic England and the Historic Environment Record maintained by Greater Manchester Archaeology Advisory Service.

3.1.2 Additional information concerning the assets, their condition, use and setting has been obtained from a survey undertaken by suitably qualified and experienced heritage specialists on 21 and 22 May 2024, including observation from surrounding vantage points and informed by appraisal and observation derived from close working with other disciplines within the project team. A site visit was undertaken on 1 July 2024 with a Landscape and Visual specialist to assess potential visual impacts of electrification across the viaduct.

3.2 Significance and setting

3.2.1 Assessment of the significance of heritage assets and their setting has been undertaken in consideration of guidance issued by Historic England. A methodology for the assessment of significance of heritage assets is outlined in Advice Note 12 (Historic England, 2019) whilst Historic England GPA3 (Historic England 2017a) provides the basis of a methodology for the assessment of setting.

3.2.2 Significance is often established by statutory designations such as listed buildings, scheduled monuments and conservation areas. More particular advice as to what makes up significance is set out in AN12, which establishes a method for thinking consistently about the heritage values that can be ascribed to a place. When making an assessment of significance, numerous aspects are considered including architectural interest, historic interest, group value, social value, former uses and local distinctiveness. These aspects are grouped into four values defined in Annex 2 of the NPPF as historical

interest, archaeological interest, artistic interest, and architectural interest.

3.2.3 In assessing whether the setting of an asset contributes to its significance, and in assessing the effect of development, Historic England GPA3 provides a checklist of attributes that may affect setting and significance under five broad categories comprising:

- The location and siting of the development;
- The form and appearance of the development;
- Additional effects (change to skyline etc.);
- Permanence; and
- Consequential effects.

4. CONSULTATION

4.1.1 Historic England and Oldham Metropolitan Borough Council (OMBC) have been involved in ongoing stakeholder consultation with Network Rail through the development of Route Section W2B of TRU.

4.1.2 Regular meetings with Historic England and OMBC have been held to discuss design development in relation to Uppermill Viaduct (MVL3/31). Initial meetings were held periodically throughout 2021 and resumed in 2024 to discuss the overall route and design development for all listed structures within Route section W2B.

4.1.3 The design development for Uppermill Viaduct (MVL3/31) was presented and discussed with the historic environment stakeholders on the dates outlined in Table 4-1:

Table 4-1 Consultation for Uppermill Viaduct (MVL3/31)

Date	Stakeholder in attendance	Key agreements/items discussed
12 January 2021	• TMBC • Historic England	• Presentation of detailed structures along Route Section W2B. • Network Rail addressed the requirements for OLE to be attached on the outside of the viaduct due to limited clearance on the trackside of the viaduct.

Date	Stakeholder in attendance	Key agreements/items discussed
16 February 2021	• TMBC • Historic England	• Presentation overview of the Order Scheme, objectives and its scope which included the full electrification and works to Uppermill Viaduct (MVL3/31). • Works to Uppermill Viaduct (MVL3/31) to help achieve the objectives of the overall Order Scheme, works to install Overhead Line Electrification (OLE) gantry fixing to the pier locations along the viaduct.
16 March 2021	• OMBC	• Presentation of early optioneering for Uppermill Viaduct (MVL3/31) and overview of the grade II listed viaduct including its location, historic background and problem statement. • Decision to install OLE portals was required in order to accommodate the electrification of the railway over the viaduct and increase the line speed from 65mph to 80mph. Gauge constraints on the existing deck and the need for a slight track slew would result in insufficient clearance to install the portals on the inside of the deck. However, given the concrete strengthening measures which were installed in 1919, these would provide ideal areas to attach these portals. • Presentation of OLE portal locations adopting a red, amber, green rating system based on natural viewpoints and surrounding vegetation. The following was determined: o Piers 0-4: Preferred (green)

Date	Stakeholder in attendance	Key agreements/items discussed
		○ Piers 5-7: Preferred (green) ○ Pier 8: Acceptable (amber) ○ Piers 9-10: Unfavourable (red) ○ Piers 11-12: Acceptable (amber) ○ Piers 13-14: Preferred (green) ○ Piers 15-16: Unfavourable (red) ○ Pier 17: Acceptable (amber) ○ Piers 18-20: Preferred (green) ○ Piers 21-22: Acceptable (amber) ○ Pier 23: Preferred (green)
26 May 2021	• OMBC • TMBC • Historic England	• Overview of the structures along Route Section W2B which are of historic interest, including the grade II viaducts which are noted for their inherent significance, particularly as essential railway structures and their shared common themes, significance and group value with each other. Acknowledgement that these are monumental examples of 19th century engineering and prominent elements of local townscape and landscape.

Date	Stakeholder in attendance	Key agreements/items discussed
		• Presentation of the purpose of Heritage Statements and their assessment of impact with the emerging GRIP 3 designs[1]. • Early-stage recommendations to minimise harm to significance against the requirements for justification of proposals and opportunities to pursue sensitive design and compensation. The proposed OLE on the viaducts were presented and included the recommendation for feasibility and optioneering around location of portals taking into account setting and how setting of the viaducts contributes towards its overall significance. The viaducts were flagged as amber on a RAG scale. • Reassurance was provided to the council that they will be involved in the GRIP 3 design process which will be used within the detailed design development of GRIP 4. Clarification was also provided on the sustainable heritage initiatives. • Historic England stated how they expect to get an understanding of significance at this stage and that they anticipate options to be shared for comment. Also stressed the importance of minimising harm.
6 February 2024	• Historic England	• Meeting with Historic England to discuss the approach taken to significant interventions to designated structures, including Uppermill Viaduct (MVL3/31).

[1] At the time of consultation in 2021, the delivery of railway investment programmes was managed by Network Rail as a staged process through use of the GRIP (Governance for Railway Investment Projects) process. GRIP 3 comprised option selection. This has since been replaced by PACE (Project Acceleration in a Controlled Environment).

Date	Stakeholder in attendance	Key agreements/items discussed

		• Electrification is required across the grade II listed viaduct and increase in line speed from 65mph to 80mph. The design consideration for the OLE portals were as follows:
		  ○ The restricted width of the viaduct which would necessitate the siting of OLE masts on the exterior face of the parapet;
		  ○ The 1920 concrete saddle has the potential for anchoring the OLE; and
		  ○ Key views of the viaduct will inform the proposed siting of the OLE Masts.
		• At this stage, the concept designs for OLE brackets have been shared with Historic England.

22 April 2024	• OMBC	• Overview of proposed works to the structures within Oldham which included the OLE portal attachments to Uppermill Viaduct (MVL3/31).
7 May 2024	• Historic England	• Agreement in principle with Historic England on the principle of attachment of OLE across Uppermill Viaduct (MVL3/31). • Justification for design of location for OLE which has been devised to avoid Den Lane, Huddersfield Narrow Canal and the High Street, and other locations would be hidden by vegetation or obscured • At this stage the development of the OLE support brackets was still being developed however these are expected to be to standard Network Rail design.

Date	Stakeholder in attendance	Key agreements/items discussed
25 June 2024	• Historic England	• Pre-application advice letter from Historic England for the OLE attachments to Uppermill Viaduct (MVL3/31) on the exterior of the viaduct would result in less than substantial harm to its significance (Appendix C.1). • Historic England summarised that less than substantial harm would arise from the change in the physical appearance on the elevations of the structure from the brackets. • Historic England conclude that harm can be lowered by following the architectural rhythm of the viaduct to lessen the visual impact.
6 November 2024	• Historic England	• The draft listed building consent drawings were shared prior to the meeting, with feedback requested from Historic England on the works shown in the drawings. Discussion also took place regarding the justification for proposed works. • Confirmation from Network Rail that the works to Uppermill Viaduct (MVL3/31) will be primarily in the inclusion of OLE Gantries and their locations have been chosen to maximise the current viewing corridors near larger spans over the road or canal, in which Historic England was in agreement with the approach and did not express any concerns.
29 November 2024	• Historic England	• In their formal pre-application advice letter (see Appendix C), Historic England confirmed that proposals for Uppermill Viaduct (MVL3/31) would result in '*a low level of less than substantial harm*'

Date	Stakeholder in attendance	Key agreements/items discussed
		• It was acknowledged that the design adhered to the rhythm of the viaduct spans to minimise visual impact and the pattress plates would not be affected (see Appendix C.2).
2 April 2025	• OMBC	• Presentation of overview of the aims and objectives of TRU to OMBC heritage officers, with emphasis on the historic context of Route Section W2B and the 12 listed building consents applications which are being prepared for the various works to the grade II listed bridges and viaduct along the route section. • Presentation of overview of electrification challenges caused by the existing arch profile of a number of existing bridges and have developed bespoke solutions for these to achieve the required clearance. • Overview of the current status of each structure within OMBC's jurisdiction, including the installation of OLE brackets to Uppermill Viaduct (MVL3/31).
4 April 2025	• Historic England	• Overview of draft comments from Historic England. Request to draw out the heritage interpretation in the reports as part of the heritage benefits. • Historic England were content with the assessment of significance for all structures, and noted that the optioneering tables were helpful. Historic England requestion for further details on the heritage interpretation as part of the heritage benefits.
12 May 2025	• OMBC	• Presentation of proposals for Uppermill Viaduct (MVL3/31) to OMBC heritage officers. • Low level of harm to listed buildings noted with minimal physical impact to structure and arrangement of OLE portals to avoid key viewing corridors.
24 June 2025	• OMBC	• Pre-application advice letter received from OMBC outlining local planning authority advice following review of the draft listed building consent application material. • OMBC found that the alteration of Uppermill Viaduct (MVL3/31) would result in a low level of less than

Date	Stakeholder in attendance	Key agreements/items discussed
		substantial harm arising from the physical intervention, the impact of which is limited by the considered placement of portals to maintain key views. • OMBC highlight that clear and convincing justification will be required for any harm arising to designated heritage assets, with substantial benefits required to outweigh substantial harm. • A high level of harm was also found to the group value of the bridges designed by A.S Jee on the TransPennine Route, due to the proposed demolition of Wright's Overbridge (MVL3/23) and reconstruction of four other bridges, and a limited level of harm to group value arising from the alteration of three other structures (including Uppermill Viaduct (MVL3/31)).
18 July 2025	• Historic England	• Pre-application advice letter received from Historic England providing overarching feedback on proposals affecting listed bridges between Stalybridge and Standedge Tunnel (see Appendix C). • Acknowledgment given to the collaborative approach taken at pre-application stage, to fully explore alternative options to reconstruction and for the opportunity for Historic England to feed into design plans. • The heritage statements adjudged to be well considered with clear justification having been provided for the substantial harm identified to those structures proposed for removal or reconstruction. • The inclusion of interpretation at Greenfield Station is welcomed by Historic England.

5. HERITAGE ASSETS AND THEIR SIGNIFICANCE

5.1 History of the W2B Transpennine Route

5.1.1 The railway connecting Stalybridge to Huddersfield, which runs over Uppermill Viaduct (MVL3/31) in Uppermill, was constructed by the Huddersfield & Manchester Railway Company between 1846 and 1849. The mid-1840s was a period of commercial confidence and massive expansion in the railway network across England, known as 'Railway Mania' which has been described by Historic England as the

Heroic Age of railway building (Historic England, 2017b). Between 1845 and 1852 the railway network expanded from 2,345 miles to 7,272 miles (3774km to 11,703km) (Alan Baxter Associates, 2019). Constructed at the height of this boom, the Stalybridge to Leeds line was a product of this trend. Traversing a challenging landscape through the Pennines, the line was planned to follow the route of the Huddersfield Narrow Canal for much of its length, with the canal acquired by the Railway Company the year after its authorisation (Alan Baxter Associates, 2019). These difficult landscape conditions resulted in the need to build several major viaducts and tunnels. These included Standedge Tunnel through the Pennines, which was constructed alongside the 1811 canal tunnel and is 'indisputably significant as a major engineering achievement' (Alan Baxter Associates, 2024).

5.1.2 The development and expansion of the railways during the 19th century transformed the landscape and settlements through which they passed, fuelling industrial growth and settlement expansion. The impact of improved communications, first with the arrival of the canal in 1811, and then the railway in 1849, provided valuable links with Huddersfield, Manchester and Leeds, enabling import of raw materials and export of manufactured goods. This fuelled the gradual industrialisation and settlement expansion along the Tame Valley. This can be seen on historic Ordnance Survey maps dating from the 19th and early 20th century where industrial development including mills, dyeworks, printworks and quarries, is shown to have been present along the route of the railway and extending into the more upland areas around Saddleworth and Harrop Dale, whilst settlements such as Mossley and Dobcross gradually expanded.

5.1.3 Uppermill Viaduct (MVL3/31) was constructed for the Huddersfield & Manchester Railway Company in the mid to late 1840s. The principal engineer for the Huddersfield & Manchester Railway was Alfred Stanistreet (A. S.) Jee (1816–1858), who was assisted by the more renowned engineer Joseph Locke (1805–1860). Jee's work on the Huddersfield & Manchester Railway represents, arguably, his greatest achievement. This can be seen particularly in the construction of the Standedge Tunnel, which at over three miles long was one of the longest and most difficult in England, but also through the various large-scale viaducts along the route. In the 1850s, he worked internationally on the Spanish line from Alar-del-Rey to Reynosa where his skill in design, his accuracy and his completeness of the details earned him high praise. He died in a fatal accident upon the opening of the second portion of that line.

5.1.4 In 1847, prior to the opening of the line, the Huddersfield & Manchester Railway Company was taken over by the London and North Western Railway (LNWR). As part of the LNWR network, the

Huddersfield & Manchester Railway formed part of a direct route from Manchester to the West Riding, enabling the LNWR to access the textile and coal industries of West Yorkshire. By 1851, the LNWR was the most prominent railway company of the period, with over 800 miles of track and was the largest joint-stock concern of its time, capitalised at £29 million. The line was acquired by the London Midland and Scottish Railway in 1923, before being nationalised in 1948.

5.1.5 Whilst other parts of the Transpennine route were subject to significant alterations, the Huddersfield & Manchester Railway between Standedge Tunnel and Stalybridge was subject to relatively limited alteration. The Micklehurst Loop was constructed from 1881-85 to provide additional capacity, and diverged from the existing railway to the east of the Tame Vally, avoiding physical interaction with the majority of its alignment. A new junction to the south of Greenfield Station is shown on historic maps from the early 20th century as additional tracks toward Oldham were established from this station. However similarly to the Micklehurst loop, the additional lines diverged from the main Huddersfield line, running westwards at its intersection with Shaw Hall Bank Road Footway (MVL3/26). The railway was also widened to the east of Diggle to accommodate additional tracks serving new bores for the Standedge Tunnel which were added in 1868-71 and 1894, necessitating widening of bridges to the east of the route.

5.1.6 Piecemeal change has occurred on the Huddersfield & Manchester Railway, most notably with the closure of a small number of stations along the route, such as Diggle and Saddleworth Stations. The route today forms part of the wider Transpennine route between York, Selby and Manchester, which comprises sections of rail line developed by different railway companies.

5.1.7 The history and significance of the Transpennine route is discussed at more length in the Route-Wide Statement of Significance (Alan Baxter Associates, 2019). This was produced to characterise the overall heritage significance of the Transpennine route.

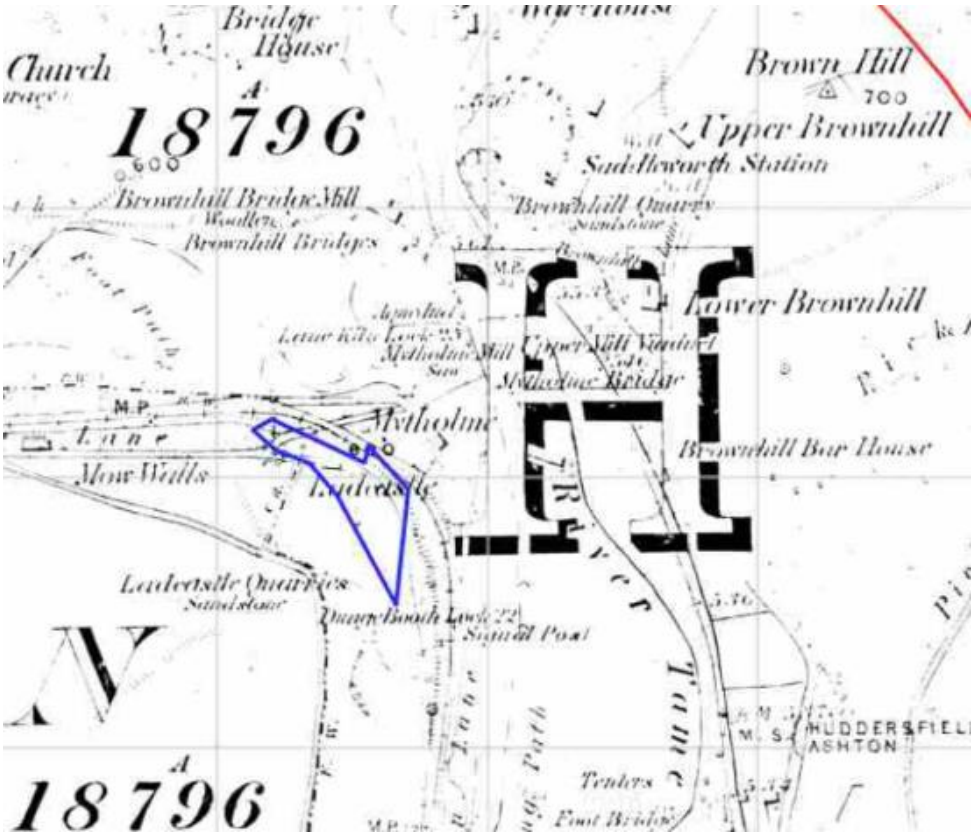
5.2 Uppermill Viaduct (MVL3/31)

History

5.2.1 Uppermill Viaduct (MVL3/31) was constructed between 1845 and 1847 during the Heroic Age of railway building (1841-1850). The 23-span viaduct was designed by A.S. Jee for the Huddersfield & Manchester Railway. The viaduct was built to carry two railway tracks over the Pennine valley, and passes over A670 High Street, Den Lane, Huddersfield Narrow Canal, the River Tame and Brownhill Lane.

5.2.2 Uppermill developed as a centre of textile production during the post-medieval period. Evidence of this can be seen in the survival of textile workshops within the town, as revealed by the presence of multi-light mullioned windows across the upper floors of some buildings of 18th century date, used to light weaving workshops. The 1828 County Map of Yorkshire (not reproduced here) shows pre-industrial Uppermill before the arrival of the railway and shows scattered buildings along Mow Halls Lane, Den Lane and the current A670 High Street extending to Knowl Top Lane and Gellfield Lane to the east. This was a dispersed settlement of farmsteads and domestic workshops were established around a central nucleus, which remains the core of Uppermill in the present day.

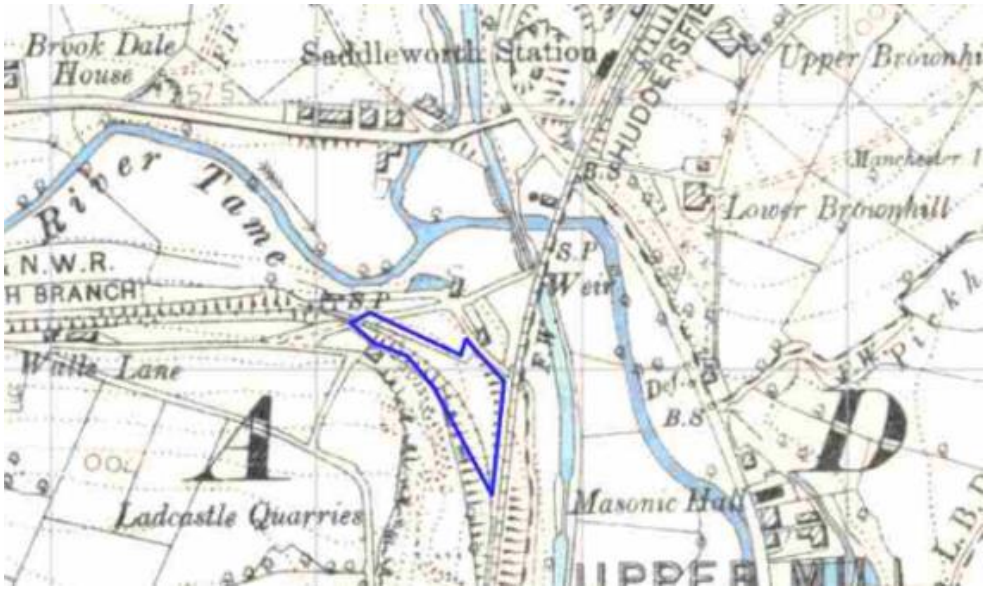
5.2.3 The mechanisation of the textile industry from the later 18th century onwards led to the development of larger-scale mills within the village, powered by the River Tame. The opening of the Huddersfield Narrow Canal in 1811 further fuelled industrialisation, enabling the import and export of raw materials and goods with Manchester and Huddersfield. The role of the canal was, however, superseded by the arrival of the Huddersfield & Manchester Railway in the late 1840s, further unlocking connections between the village and the industrial and trading centres of Manchester, Leeds and Huddersfield. Historic Ordnance Survey maps show this progression, with a shift from small-scale woollen mills and tenter grounds, as shown on the County Series Map of 1854, to larger-scale cotton and woollen mills by the time of the 2nd edition 25-inch map of 1893 (not reproduced here).



Insert 5-1 Ordnance survey County Series 1854 Map

5.2.4 The arrival of the railway resulted in significant and highly visible change to Uppermill, namely the construction of the 23-span Uppermill Viaduct (MVL3/31). The presence of the viaduct crossing the river, canal and roads in the north-west of the village formed a dominant new element and became a conspicuous symbol of Uppermill's connection to the wider north of England. The impact of the viaduct can be seen in James Carse's painting of the River Tame Valley from 1859 which shows the viaduct as a dominant element within the landscape (Insert 5-2). Other changes in Uppermill instigated by the railway included rerouting existing roads which forced the extension of High Street to pass underneath the viaduct as well as the construction of New Dobcross Road. A railway station was also constructed to the north of Uppermill and the viaduct and operated from 1849 to 1968. A second station was located to the east along the Stalybridge & Diggle Loop Line to the east of the settlement. The County Series map of 1890-92 (Insert 5-3), development, particularly to the north of the viaduct underwent some growth and expansion, as well as along the High Street in Uppermill.

Insert 5-2 Landscape painting by James Carse (1859) of the River Tame Valley, featuring Uppermill Viaduct (MVL3/31).



Insert 5-3 County Series Map 1890-92

5.2.5 Into the 20th century, Uppermill and Dobcross developed with an industrial character as can be seen in the presence of quarries, textile mills, sawmills and dyeworks on historic mapping of the period. The immediate environs of the viaduct, however, was largely surrounded by open land, the road network and some scattered buildings.

5.2.6 Since the mid-20th century, industry throughout the Pennines had slowly declined and, whilst the character of Uppermill recalls its industrial heritage, the area has developed with a more residential and commercial character. However, the viaduct is amongst the structures which help to recall the industrial heritage of Uppermill and remains a

landmark feature in the area which can be appreciated in views from the Huddersfield Narrow Canal, Den Lane and the High Street.

Insert 5-4 Uppermill Viaduct (MVL3/31) viewed from the canal to the north-west with Lock 23 of the Huddersfield Narrow Canal visible in the foreground.

Insert 5-5 Uppermill Viaduct (MVL3/31) viewed from the canal from the south-east.

Description

5.2.7 Uppermill Viaduct (MVL3/31) is comprised of 23 semi-circular arched spans and extends approximately 265m across the River Tame Valley. It runs on a slightly curved alignment with a north-east / south orientation. The viaduct carries the railway over three public roads: Den Lane (span 9), the A670 High Street (span 21) and Brownhill Lane (span 22), as well as the watercourses of the Huddersfield Narrow Canal (span 15) and the River Tame (span 18). The remaining spans accommodate the wooded open land of the River Tame valley sides and floor. Both ends of the structure have abutments buried into the valley sides and railway embankments.

5.2.8 The viaduct is constructed in rock-faced gritstone with dressings in ashlar and quarry-faced gritstone. The viaduct arches are semi-circular, with three broader skewed spans which traverse Den Road (span 9), the Huddersfield Narrow canal (span 15) and A670 High Street (span 21). The arches have rusticated v-channelled voussoirs with picked surfaces and tooled edges, which spring from squared ashlar impost bands. Two of the skewed arches, spans 15 and 21, feature corbels which would have supported wooden centres used during construction of the structure (Alan Baxter Associates, 2024).

5.2.9 The rectangular piers and spandrels of the viaduct are topped by a squared projecting string course and parapets. The piers on either side of the skewed arches feature flat pilasters, articulating these wider arches. In each case, the pilasters on the northern pier of each

of these spans essentially form double buttresses (visible in Insert 5-4).

5.2.10 On either side of the deck of the structure, parapets of squared and coursed rock-faced gritstone sit atop the projecting string course (see Insert 5-7). The parapets are relatively low, with only four and five courses of stonework visible above the ballast level on either side. A pitched ashlar coping runs across the parapets with recently installed GRP black handrail. The handrails are of dark colour and positioned slightly inbound of the centre of the coping of each parapet to minimise visual intrusions from ground level. Due to the partially buried arches of the southernmost spans (see below), the parapet on the western side of the structure commences between spans 2 and 3.

5.2.11 The viaduct does not feature wing walls at each end, with the structure instead being buried into the hillside on each approach. The topography of the surrounding valley sides defines the sub-structure of the viaduct in these locations, particularly at the southern end, where spans 1 to 4 are partially buried into the hillside on the western side of the viaduct. At the northern end, span 23 is also partly buried on both sides of the structure into the hillside.

5.2.12 The deck of the viaduct carries two tracks along its full length, supported on a track bed of ballast. In 1919, the viaduct deck was strengthened with a concrete saddle installed over the arches. The saddle was installed below the string course within the spandrel walls, sitting above the arches (Insert 5-8). This intervention was undertaken to improve the structural integrity of the viaduct, and is not visible externally. Evidence of earlier strengthening works can also be seen in the form of tie bars and pattress plates which were installed along the viaduct at the same time and remain in place today (Insert 5-7). Further pattress plating is also visible on the insides of the piers of the viaduct on a number of spans. Drainage downpipes are present between a number of the spans, some of which appear to have been later replacements or additions.

Insert 5-6 Deck of Uppermill Viaduct (MVL3/31), viewed from the southern end of the structure, showing parapets

5.2.13 The setting of Uppermill Viaduct (MVL3/31) contributes to the asset's significance. Uppermill Viaduct spans the Tame Valley, to the north of the village of Uppermill, crossing the watercourses of the Huddersfield Narrow Canal and River Tame, as well as the roads of Den Lane and High Street (A670). The surroundings of the viaduct are characterised by the presence of mature tree cover along the river, canal and flanking hillsides, restricting views of the structure principally to corridors along the canal, Den Lane and High Street. Whilst visibility is increased during the winter months due to lack of foliage, views towards the viaduct continue to be filtered by trees, preventing clear views of the structure outside the corridors of the canal, Den Lane, and the High Street. There are no views of the viaduct from the core of the settlement along High Street to the south of the viaduct. Uppermill Viaduct (MVL3/31) is visible as linear element in longer-range views from the hillsides above Uppermill or around Dobcross, however, it is not possible to appreciate the full monumental scale of the viaduct to in these views.

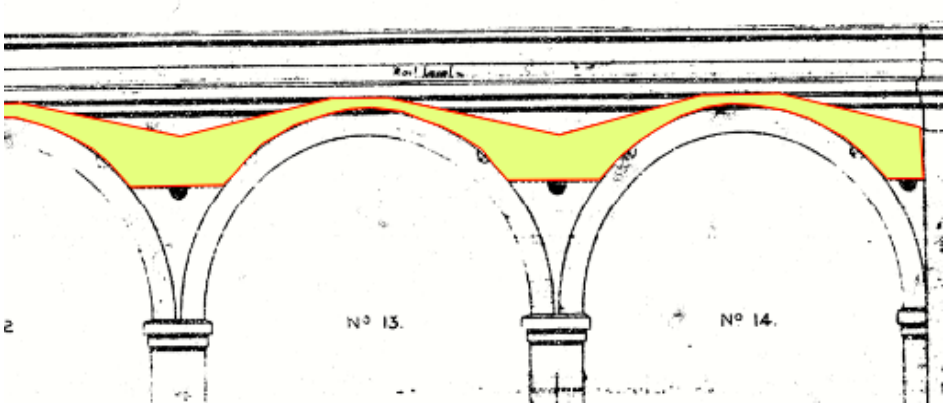
5.2.14 Views of the Uppermill Viaduct (MVL3/31) along the canal, Den Lane and the High Street/Wool Road are channelled towards and under the structure by the surrounding woodland, with the viaduct gradually being revealed on approach to it. These views enable the scale and grandeur of the viaduct to be appreciated, and allow understanding of its architectural and historic interest and the quality of Jee's design (Insert 5-6, Insert 5-10 and Insert 5-11). Even in close up views of the structure, visibility of the viaduct is limited by the presence of mature

trees, and it is not possible to view the structure in its entirety (Insert 5-11).

5.2.15 Uppermill Viaduct (MVL3/31) enjoys strong group value with Huddersfield Narrow Canal and the grade II listed Lock 23 and adjoining tailbridge No.75 (NHLE 1356719) (Insert 5-12 Uppermill Viaduct (MVL3/31) and tail bridge No.75 (NHLE 1356719) on the Huddersfield Narrow Canal showing their close relationship and use of skew arch. (Insert 5-12). Views north and south along the canal enable appreciation of this relationship and contribute to the historic, architectural and aesthetic value of the viaduct (Insert 5-4).

5.2.16 Those traveling by train over the viaduct are also afforded views of the surrounding landscape and villages, which evidence the historic character of Uppermill village and its association with the canal, and the Pennine landscape and this contributes towards its setting. Such views from the railway characterise the experience of passengers on the Transpennine route passing through the Tame Valley. These views allow the impact of the railway in the development of the area during the 19th century to be appreciated, with former mill buildings, chimneys and settlements characterised by gritstone and sandstone terraces visible along the valley floor.

Insert 5-7 View of typical span detailing on the western elevation of the Uppermill Viaduct (MVL3/31)



Insert 5-8 Placement of Concrete reinforcement added in 1919 to Uppermill Viaduct (MVL3/31) from an archival drawing held by Network Rail.

Insert 5-9 View of Uppermill Viaduct (MVL3/31) from the Brownhill Nature Garden to the north, showing an example of a restricted view of the structure.

Insert 5-10 View of Uppermill Viaduct (MVL3/31) from Wool Road.

Insert 5-11 Uppermill Viaduct (MVL3/31), eastern elevation viewed from Den Lane.

Insert 5-12 Uppermill Viaduct (MVL3/31) and tail bridge No.75 (NHLE 1356719) on the Huddersfield Narrow Canal showing their close relationship and use of skew arch.

Significance

5.2.17 Uppermill Viaduct (MVL3/31) is of significance as a largely unaltered example of an 1840s viaduct, dating from the Heroic Age (1841–50) of railway building and the period of 'railway mania' which marked a time of commercial confidence and expansion in the railways. The viaduct's direct historic relationship with historic railway companies of the period, comprising the Huddersfield and Manchester Railway and LNWR, and the notable railway engineer A.S. Jee, who also designed similar structures along the route, give the structure historical value from which it derives significance. The viaduct remains in use as a part of the operational railway network and together with surviving contemporary structures, evidences the historic infrastructure of the Huddersfield & Manchester Railway.

5.2.18 The viaduct derives significance from its architectural quality, evident in its design, detailing and monumental form. A.S. Jee's use of architectural elements such as the rusticated voussoirs and monumental pilasters, and the quality of detailing and construction, together with the quality of the craftsmanship, help to elevate the expression of the viaduct and raise it above the purely functional. The architectural interest of the viaduct is enhanced further by its presence within the landscape and the ways in which its monumental scale, architectural quality and engineering achievement can be appreciated in views towards and through the viaduct as it spans the valley.

5.2.19 Uppermill Viaduct (MVL3/31) has undergone some alterations including strengthening works and the attachment of modern handrails, all of which have been undertaken to ensure the ongoing

use of the structure for its original purpose. These works have not detracted from the historic and aesthetic interest of the structure. Jee's original design intent and the historic function of the structure continues to be understood and form key aspects of the structure's significance. The corbels along the string course on spans 15 and 21 reveal the construction techniques used by Jee to construct the complex arrangement of skew arches required to traverse the watercourses below. As a surviving component feature along the wider railway network, the design of Uppermill Viaduct (MVL3/31) contributes to the legibility of the Huddersfield & Manchester Railway in the contemporary landscape.

5.2.20 Historic Ordnance Survey maps show the setting of the viaduct formerly to have been characterised by the presence of quarry workings to the south-west and enclosed land along the base of the valley and dispersed development to the north, with only pockets of tree planting in this area. This would have afforded extensive views of the structure from the surrounding landscape. The setting of Uppermill Viaduct (MVL3/31) today, however, is more localised and screened due to extensive mature planting. Despite this, the setting of the viaduct contributes towards its overall significance. Spanning the River Tame and the Huddersfield Narrow Canal, the viaduct forms an imposing structure which, although visible in localised views only, forms a landmark structure within the settlement of Uppermill. The viaduct's position over and adjacent to local roads and waterways enable appreciation of its design and function (with the addition of the frequent movement of trains atop it), defines it as an element of the historic industrial and transportation network within the area. The close relationship of the viaduct and canal, and particularly views of the viaduct along the canal corridor, and its spanning over Lock 23 and tailbridge No.75 (NHLE 1356719) illustrate the close historic connection between the Huddersfield & Manchester Railway and the Huddersfield Narrow Canal. The engineering achievement of the viaduct is also vividly illustrated by the way in which the viaduct crosses over the tailbridge with a wider skew span. Experiencing the viaduct by passing under the spans on Den Lane and High Street, or along the canal, enables appreciation of the quality of its design and skill in construction. Views from the viaduct can also be appreciated by train passengers, with expansive views of Uppermill to the east and its setting within the Pennines. To this effect, the setting facilitates a different appreciation of the significance of Uppermill Viaduct (MVL3/31) not just as a mode of transportation but as a feature within a landscape characterised by the juxtaposition of its natural and industrial history.

Group value

5.2.21 As identified in the list description, Uppermill Viaduct (MVL3/31) is recognised to be of group value with other listed structures by A.S. Jee on the Huddersfield & Manchester Railway[2]. These comprise:

- Heyrod Hall Overbridge (MVL3/7) (grade II listed, NHLE 1449242);
- Springbank Lane Footbridge (MVL3/8) (grade II listed, NHLE 1452382);
- Springbank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (grade II listed, NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405);
- Wright's Overbridge (MVL3/20) (grade II listed, NHLE 1452409);
- Wright's Mill Overbridge (MVL3/23) (grade II listed, NHLE 1452406);
- Royal George Underbridge (MVL3/25) (grade II listed, NHLE 1451848);
- Shaw Hall Bank Road Footway (MVL3/26) (grade II listed, NHLE 1451852);
- Oldham Road Overbridge(MVL3/28) (grade II listed, NHLE 1451853);
- Wickens Underbridge (MVL3/29) (grade II listed, NHLE 1451854);
- Slaithwaite Viaduct (MVL3/61) (grade II listed, NHLE 1224049);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);
- Milne Viaduct (MVL3/76) (Longwood Viaduct) (grade II listed, NHLE 1220121);
- Church Street (MVL3/82) (grade II listed, NHLE 1452083);

[2] Wheatley's Overbridge (MVL3/103) (grade II listed NHLE 1450537) was designed by A.S. Jee for the Huddersfield & Manchester Railway. The Overbridge was granted consent for extensive change as part of the Huddersfield to Westtown (Dewsbury) Order section of the Transpennine Route Upgrade, and will be demolished and replaced with a new structure (ref 2021/91337). This is likely to result in de-listing. As such its contribution to group value has therefore been excluded from this assessment.

- Huddersfield Viaduct (MVL3/92) (grade II listed, NHLE 1223531);
- Hillhouse Lane Underbridge (MVL3/94) (Willow Lane East) (grade II listed, NHLE 1432641); and
- B6118 Colne Bridge Road Overbridge (MVL3/107) (grade II, NHLE 1450265)[3]

5.2.22 The route is notable for the succession of viaducts, required due to the hilly terrain which it navigates. Along the Huddersfield & Manchester Railway there are four other viaducts designed by A.S. Jee. These comprise:

- Slaithwaite Viaduct (MVL3/61) (grade II listed , NHLE 1224049);
- Crimble Viaduct (MVL3/64) (grade II listed , NHLE 1233737);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);[4] and
- Milne (Lockwood) Viaduct (MVL3/76) (grade II listed , NHLE 1220121).

5.2.23 The viaducts at Slaithwaite (MVL3/61), Crimble (MVL3/64) and Milne (Lockwood) (MVL3/76) have similar design language to that at Uppermill Viaduct (MVL3/31) and are all of considerable scale with 17, 19 and 20 arches respectively. Golcar Viaduct (MVL3/70) is not as large in scale with only four arches but it is similar in style and construction. In each case, stylistic motifs are employed such as rusticated dressings and string courses which add architectural quality to the functional structures. Each viaduct also forms a prominent element of its surrounding landscape or townscape. Slaithwaite (MVL3/61), Crimble (MVL3/64) and Milne (Lockwood) (MVL3/76) Viaducts form a legible group with Uppermill Viaduct (MVL3/31), evidencing Jee's common approach to the engineering of these structures. That all four have been little altered adds to their group value. Though the similar aesthetics and scale of the viaducts place them in close relationship with one another, Uppermill Viaduct (MVL3/31) is also part of a wider group of structures constructed by Jee for the Huddersfield and Manchester Railway, which also includes underbridges and overbridges of both cast iron and masonry construction as well as the Standedge Tunnel.

[3] B6118 Colne Bridge Road Overbridge (MVL3/107)) (grade II, NHLE 1450265) will be partially demolished and rebuilt with a supplementary structure replacing its spans over the railway. Listed building consent has been granted for this considerable intervention (ref: 2021/91330), and as a result may limit the contribution that this bridge makes towards the group value with the Jee bridges.

[4] MVL3/69 Golcar New Viaduct (constructed by the LNWR in c.1890) and MVL3/70 Golcar Viaduct are both Listed together under one designation. https://historicengland.org.uk/listing/the-list/list-entry/1276344

5.2.24 The largely contemporary construction of a number of individual railways which combined to form the wider Transpennine route mean that historic structures derive significance as part of wider groups across these various historic lines. As noted above, large-scale viaducts are a feature of those constituent historic railways which make up the Transpennine route today. In particular, a number of the viaducts engineered by Thomas Grainger for the Leeds, Dewsbury and Manchester Railway demonstrate similarities in scale and architectural detailing to Jee's viaducts on the Huddersfield and Manchester Railway, including Uppermill Viaduct (MVL3/31). Three examples from Grainger, in particular, demonstrate these similarities and form a legible group alongside Jee's viaducts:

- Batley (Union Mill) Viaduct (MDL1/27) (grade II listed , NHLE 1134650);
- Dewsbury Viaduct (MDL1/19) (grade II listed , NHLE 1313659); and
- Churwell Viaduct (MDL1/40) (grade II listed , NHLE 1451053).

5.2.25 The group value which Uppermill Viaduct (MVL3/31) derives from these relationships provides an understanding of the wider trends and engineering achievement which characterise both the Huddersfield & Manchester Railway and the Heroic Age of railway building (1841–50) more generally. This group value is enhanced by the structures continuing to form part of the operational railway; as a collective group of assets, they are experienced by those following the rail line (traveling on it, or near it) as coherent features of a single historic route.

5.3 Surrounding heritage assets

5.3.1 The location of the designated and non-designated heritage assets discussed below are shown in Appendix A.

Designated heritage assets

5.3.2 A total of four listed buildings are present within 250m of the Uppermill Viaduct (MVL3/31). These comprise:

- Huddersfield Narrow Canal, Lock No. 23 (Lime Kiln Lock and adjoining Tailbridge No. 75 and Aqueduct No. 74) (grade II, NHLE 1356719), a lock, tail bridge and adjoining aqueduct over the River Tame built by Benjamin Outram between 1794-99, located directly below and to the west of the viaduct.
- Huddersfield Narrow Canal Lock No. 22W (Dunge Booth Lock) (grade II, NHLE 1163263), a lock built by Benjamin Outram in 1794-99 for the Huddersfield Narrow Canal, located c.180 m to the south.

- Brownhill Bridge Mill (grade II, NHLE 1309426), a water-powered woollen mill built in 1722, located c.160 m to the north.
- Lower Brownhill House (grade II, NHLE 1309706), a late 18th century vernacular stone house, located c.120 m to the east.

5.3.3 Huddersfield Narrow Canal, Lock No. 23 (NHLE 1356719) is situated directly to the west of the viaduct, the ramp for the tail bridge extending beneath span 15 of Uppermill Viaduct (MVL3/31). Whilst the lock predates the construction of the railway by c. 50 years and its significance is focused on its association with the Huddersfield Narrow Canal, the relationship of the lock and viaduct contributes to their significance, evidencing the development of transportation and communications through the Tame Valley in the 19th century. The viaduct forms a prominent feature in its setting of the lock, framing views of the lock and the canal.

5.3.4 Due to the curve of the canal and the presence of mature trees on its west bank, views towards Uppermill Viaduct (MVL3/31) from Huddersfield Narrow Canal Lock No. 22W (NHLE 1163263) are more oblique and filtered. The dominance of the viaduct is however understood when moving along the towpath to the next lock and contributes to the understanding of the historic interrelationship between the canal and railway.

5.3.5 Whilst filtered oblique views towards Uppermill Viaduct (MVL3/31) are possible from Brownhill Bridge Mill (NHLE 1309426), these views are incidental to the building and make limited contribution to its significance due to the lack of historic relationship between the structures.

5.3.6 The principal elevation of Lower Brownhill House (NHLE 1309706) looks south, parallel to the viaduct, with views west towards the viaduct constrained by mature tree planting. Dating from the 18th century, the building does not enjoy a significant historic relationship with the Uppermill Viaduct which does not make a notable contribution to its significance.

5.3.7 Uppermill Conservation Area (DGM3166) is located south-east of the Uppermill Viaduct (MVL3/31), which lies within its northwestern extent. The conservation area is characterised by the presence of post-medieval domestic and industrial buildings, dating principally from the 18th and 19th centuries. Within the historic core of the village along High Street, buildings are typically of two to three storeys in height and constructed in local stone. These include vernacular houses, some with weaving workshops on their upper floors, 19th century terraces and shops, villas, former mills, churches and pubs. The river and canal are located to the west of the conservation area and separated from the High Street by mature tree planting and

intervening buildings. Despite this, the viaduct forms a key element in the conservation area, forming a large-scale feature within the designated area and evidencing the contribution of the railway to the history and development of the settlement. Views from the canal are channelled along the towpath, with Uppermill Viaduct (MVL3/31) forming a landmark feature within the canal corridor. Views of the viaduct are possible from a small number of locations to the west of the conservation area. These views are generally constrained by surrounding planting, enabling only a few spans to be viewed simultaneously. Views of the viaduct from the canal towpath, and movement towards and under the viaduct form an important aspect of the conservation area's character and contribute to its significance. Views of the viaduct and conservation area from the surrounding hills also contribute to this significance, enabling its scale and form to be understood.

Non-designated heritage assets

5.3.8 The Greater Manchester Historic Environment Record (HER) records 10 non-designated heritage assets within 250m of Uppermill Viaduct (MVL3/31), four of which duplicate the listed buildings identified in paragraph 5.3.2 above. The remaining assets comprise:

- Buckley (New) Mill (6098.1.0), c. 240 m south-east of the southern end of Uppermill Viaduct (MVL3/31), which was subject to a field investigation in 2003 (EGM3497);
- Mytholm Mill (site of) (16625.1.0), located c. 55 m west of Uppermill Viaduct (MVL3/31);
- Saddleworth Station (former) (173.1.0), located c. 160m north of the northern end of Uppermill Viaduct (MVL3/31);
- Barrow on Brown Hill (site of) (1096.1.0), c. 190 m north-east of the northern end of Uppermill Viaduct (MVL3/31);
- Woolroad Canal Warehouse (site of) (13851.0), located c. 190 m north-west of the northern end of Uppermill Viaduct (MVL3/31); and
- Woolroad Canal Warehouse (at Stone Bottom Mills) (13850.1.0), located c. 240 m north of the northern end of Uppermill Viaduct (MVL3/31).

5.3.9 Saddleworth Station (former) (MGM291) was constructed contemporarily with the Huddersfield & Manchester Railway to serve the village of Uppermill. Now in residential use and privately owned, this is a two-storey building with gable and bay window, ornamental rood, veranda with cast-iron pillars. The former station retains a historic relationship with the railway viaduct given that they both

serviced the operation of the railway and helps to communicate the Huddersfield & Manchester route.

5.3.10 Woolroad Canal Warehouse (13850.1.0) is a modest canal-side warehouse dating to the early 19th century. The setting of this structure on the Huddersfield Canal is the key aspect of setting which contributes to its significance, and it does not enjoy any visual relationship with Uppermill Viaduct (MVL3/31).

5.3.11 Buckley (New) Mill (MGM7146), Mytholm Mill (MGM18723) and Woolroad Canal Warehouse (site of) (13851.1.0) are the former locations of mills, the setting of which does not contribute to their significance.

5.3.12 Barrow on Brown Hill (site of) (1096.1.0) comprises the possible site of a barrow or cemetery, destroyed in the mid-19th century. It was probably of late Neolithic or Bronze Age date and shares no historic or visual relationship with the railway or Uppermill Viaduct (MVL3/31) which therefore does not contribute towards its significance.

6. PROPOSALS

6.1 Background of proposals

6.1.1 In order to achieve the TRU Programme objectives of improving journey times, capacity, overall reliability and resilience, and delivering environmental benefits, the electrification of the railway line and achievement of increased line speed is required. This necessitates the installation of overhead line equipment (OLE) along Route Section W2B, and the installation of OLE across Uppermill Viaduct (MVL3/31).

6.1.2 Due to the length and curve of Uppermill Viaduct (MVL3/31) and the required distance between OLE portals, it is not possible to span the OLE wires across the viaduct with portals only at either end. As such, it has been determined that portals need to be installed on the viaduct itself. These requirements have been considered as part of the optioneering process which has sought to minimise the visual presence of the portals on the structure. As part of this process, electrification across other historic listed railway viaducts was reviewed to inform the design and siting of proposed OLE across Uppermill Viaduct (MVL3/31).

6.2 Design development and justification

6.2.1 Design development for the installation of OLE at Uppermill Viaduct (MVL3/31) has taken into consideration a number of factors including the significance of the listed structure, operational requirements and constructability. The design development process has been undertaken with engagement with Historic England and OMBC (as detailed above in Section □). This iterative and robust process ensures the rigorous exploration of available options, incorporating multi-disciplinary review and ongoing engagement with the heritage consultees.

6.2.2 The design development process included optioneering to determine the position of the OLE portals on the structure. This process was undertaken to determine the most appropriate location, form and type of OLE structure that would accommodate the needs of TRU whilst also minimising impact on the fabric and views of the grade II listed viaduct. Three options were examined, as set out in Table 6-1:

Table 6-1 OLE placement optioneering for Uppermill Viaduct (MVL3/31).

Option	Considerations	Assessment	Preferred	Illustration
Option 1: trackside installation of OLE	Sufficient clearance required between tracks and parapet. No modification required to the viaduct deck, parapet or deck structure. Minimal impact to viaduct fabric and appearance.	Narrow deck width across Uppermill Viaduct (MVL3/31) is insufficient to accommodate OLE within parapets and provide necessary clearance to track alignment.	N	Option 2 – install OLE in line with the parapet.	Localised reduction in width of parapet required to accommodate the OLE within the parapet thickness. Localised reconstruction of parapet required to accommodate OLE.	Narrow deck width across Uppermill Viaduct (MVL3/31) is insufficient to accommodate OLE within the parapet thickness and provide necessary clearance to track alignment. Parapet width insufficient to accommodate OLE foundations.	N	Option 3 - fix the OLE portals to the external elevations of the viaduct	Viaduct piers required to be of sufficient strength to support OLE portals and may require strengthening to accommodate. Greatest visual impact of all three options.	Good structural condition of viaduct provides sufficient strength to accommodate installation of OLE portals to exterior elevations. External placement of portals provides suitable clearance and can accommodate freight gauges.	**Y**	
6.2.3 The minimum lateral clearance from the rail to parapet would require at least 3000 mm in order to fit the portal base adjacent to the track. The western side of the structure would require a clearance of 1470 mm and the eastern side of the structure would require 1600 mm. Option 1 trackside installation of OLE and Option 2 installation of OLE in line with the parapet were therefore discounted due to insufficient clearance between the tracks and parapet.

6.2.4 Option 3 fixing the OLE to the exterior of the viaduct was therefore identified as the preferred option and progressed for the design stages. This was recognised to be the most feasible option which would achieve the required clearance from the track alignment, although resulting in the greatest impact upon the appearance of the listed structure. Further consideration was then given to ensuring the proposed works would be sympathetic to the character and appearance of the historic structure.

6.3 Development of Preferred Option

6.3.1 Design development was subsequently undertaken to mitigate the potential impact of the OLE portals on the significance of Uppermill Viaduct (MVL3/31) as far as reasonably practicable and to develop a sensitive design solution which would ensure the structure complies with Network Rail safety standards.

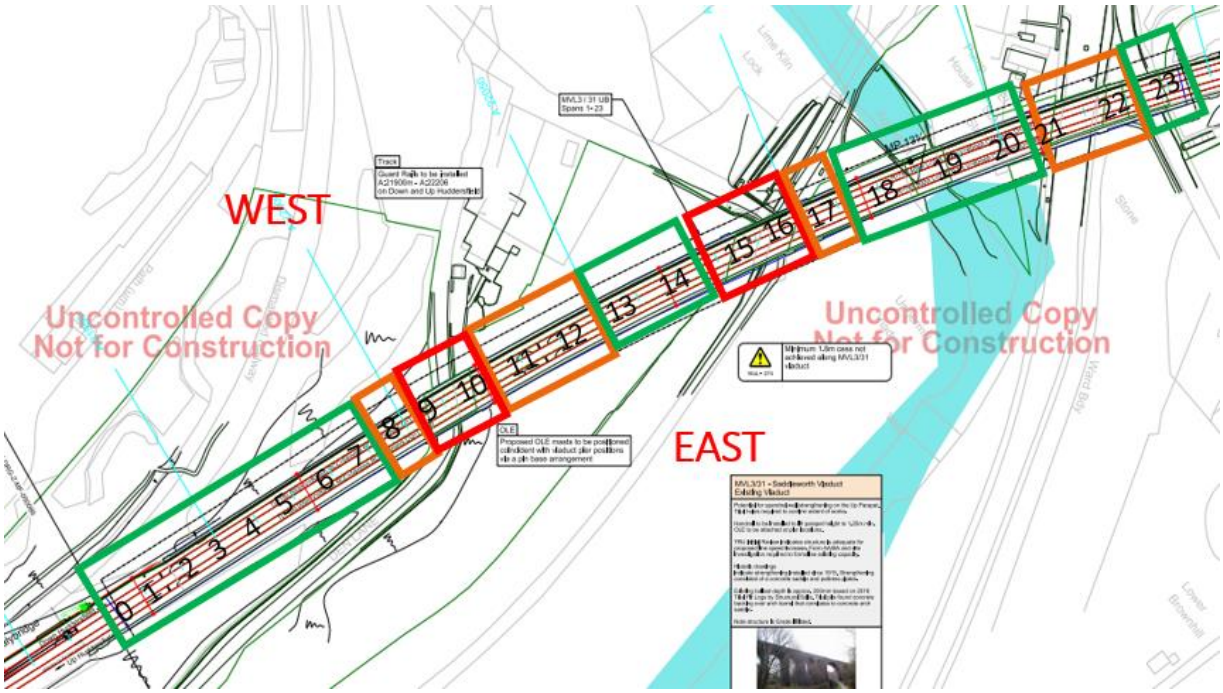
6.3.2 Optioneering was undertaken to determine the preferred location of the OLE portals. The objective of this exercise was to minimise visual impacts where possible, taking into consideration the architectural interest of the viaduct and its setting. This process took into consideration a range of factors including:

- The curve of the structure and the space of masts along this;
- The historic significance of the viaduct;
- The architectural rhythm and features of the viaduct;
- Views of the structure;
- Its prominence within its setting; and
- The structural requirements for the OLE portals.

6.3.3 The identification of suitable OLE locations was informed by analysis of the architectural form of the viaduct and its irregular span arrangement, as well as key views of the structure. The findings of this process are set out in **Table 6-2**.

Table 6-2 Optioneering for placement of OLE portals

Pier (south to north)	Suitability for OLE	Reason
0-4	Preferred	Viaduct buried on west, trees shielding on east.
5-7	Preferred	Trees shielding on both sides.
8	Acceptable	Span above Den Lane, however tree shielding views on both sides slightly.
9-10	Unfavourable	Avoided larger spans including Den Lane to minimise intrusion in views of the viaduct.
11-12	Acceptable	Trees shielding only on east.
13-14	Preferred	Trees shielding on both sides.
15-16	Unfavourable	Avoided larger spans including Huddersfield Narrow Canal and towpath to minimise intrusion in views of the viaduct.
17	Acceptable	Trees slightly shielding views of viaduct on both sides
18-20	Preferred	Trees shielding on both sides
21-22	Acceptable	Carriageway, trees shielding on both sides
23	Preferred	End of viaduct, trees shielding on both sides

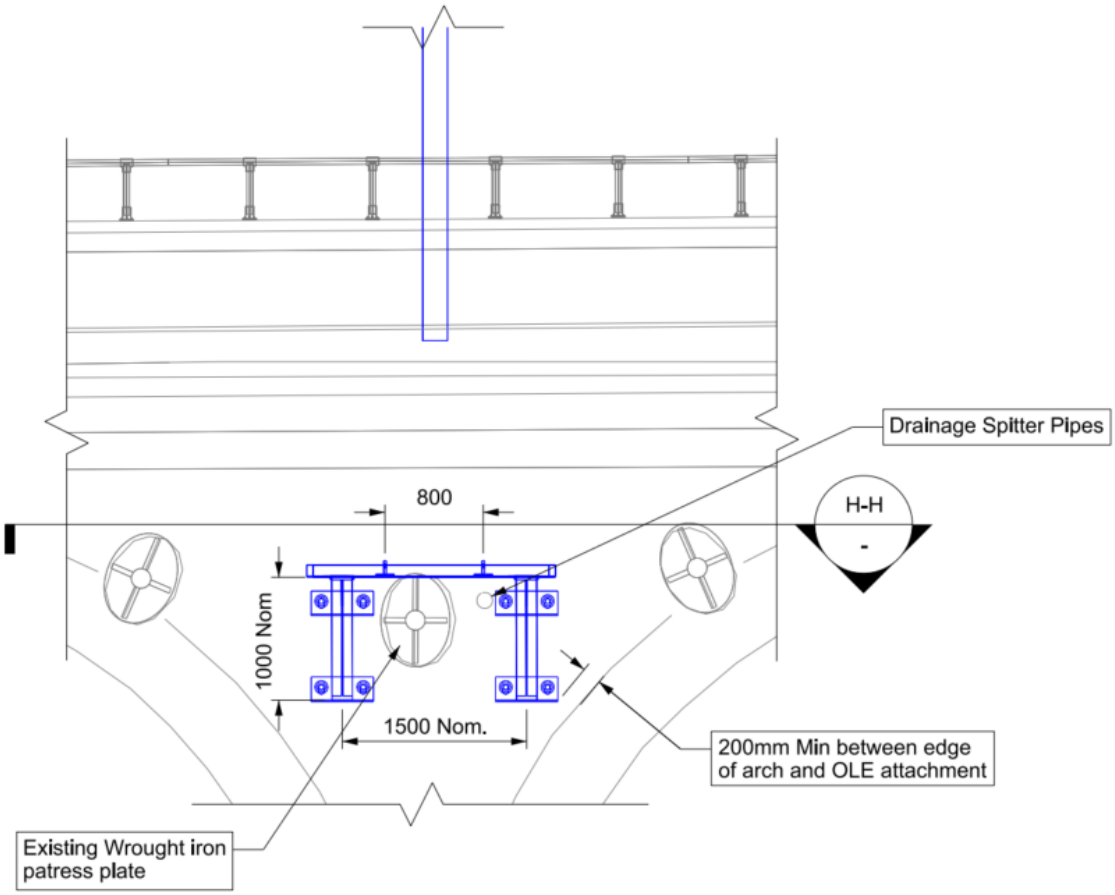


Insert 6-1 Pier location and location Optioneering for placement of OLE portals

6.3.4 Based on this assessment, it was determined that the OLE portals be placed over piers 5, 8, 11, 14, 17, 20 and 25.

6.3.5 Further design development was then undertaken of the wall brackets attached to the viaduct spandrels. This took into consideration factors including:

- The structural requirements of the OLE brackets;
- Attachment into the concrete saddle;
- The presence of pattress plates and drainage pipes on the viaduct spandrels; and
- The form of the viaduct and its architectural features.

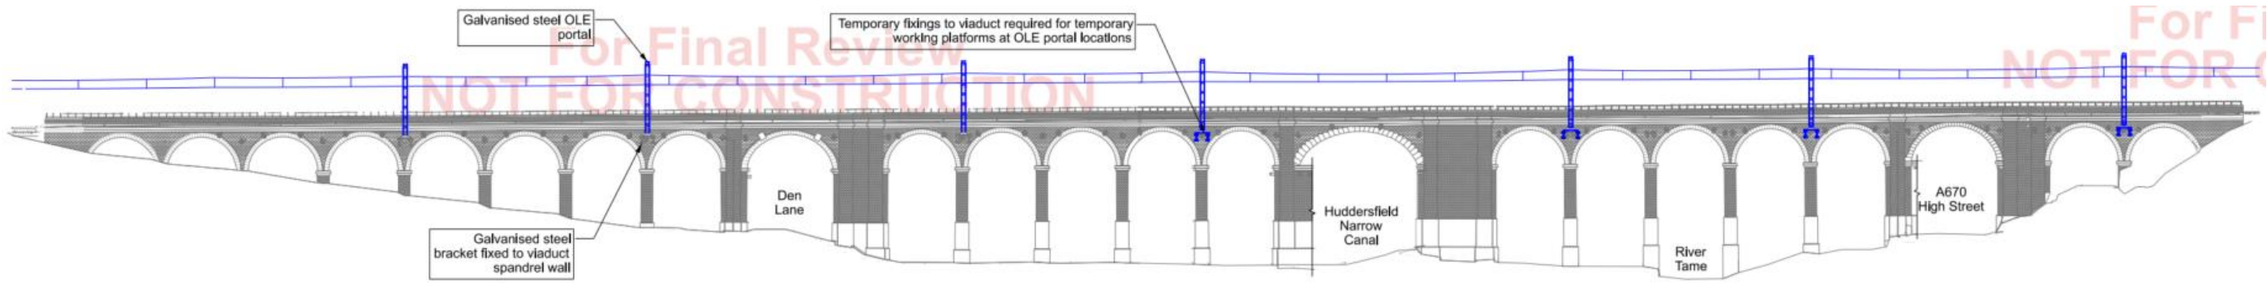


Insert 6-2 Detail of typical OLE fixing bracket showing avoidance of pattress plate and drainage pipe.

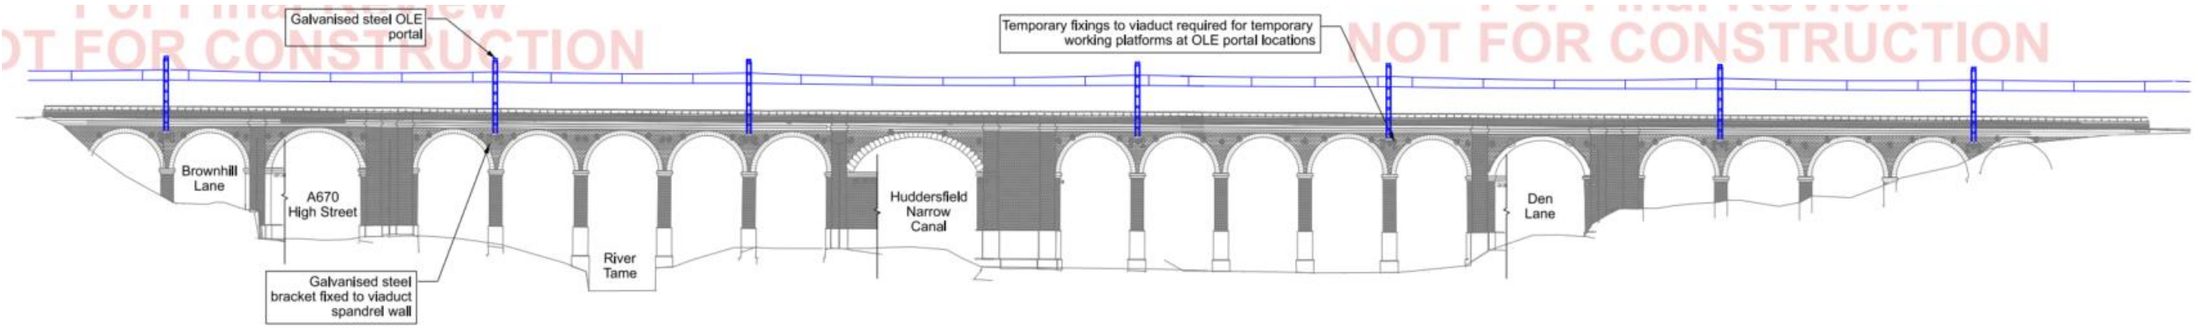
6.4 Description of proposals

6.4.1 It is proposed to install seven OLE portals along Uppermill Viaduct (MVL3/31) which would support the overhead wires along this section of the route. This would require the attachment of OLE portal brackets on the exterior of the viaduct on the spandrel walls.

6.4.2 The OLE portals would be placed over piers 5, 8, 11, 14, 17, 20 and 25 (Insert 6-3 and **Insert 6-4**). Each portal would be supported on galvanised steel wall brackets installed into the masonry spandrel walls above the piers. This would require holes to be drilled for insertion of anchors into the concrete saddle and attachment of the bracket steelwork on to these anchors. Bespoke bracketry has been proposed to avoid any clash with the viaduct's existing pattress plates and drainage downpipes on the face of the spans.



Insert 6-3 Proposed east elevation of Uppermill Viaduct (MVL3/31) showing the proposed spacing of OLE.



Insert 6-4 Proposed west elevation of Uppermill Viaduct (MVL3/31) showing proposed spacing of OLE.

Insert 6-5 Visualisation of OLE portals at Uppermill Viaduct (MVL3/31) from pedestrian perspective

Insert 6-6 Visualisation of OLE Portals at Uppermill Viaduct (MVL3/31) from an aerial perspective

Construction methodology

6.4.3 The proposed works to install the OLE portals to Uppermill Viaduct (MVL3/31) would comprise the following works for each bracket:

- Set up temporary working platform;
- Core eight holes 80mm wide through the viaduct face;

- Install eight M40 stainless steel ribbed Macalloy bars within the core holes and secure with grout;
- Attach bracket; and
- Remove the temporary working platform.

6.4.4 The proposed works to Uppermill Viaduct (MVL3/31) are shown in the following drawings which accompany this application:

- Existing and Proposed Plans (167037-TGP-26-MVL3-DRG-T-LP-163103);
- Existing and Proposed Elevations (167037-TGP-26-MVL3-DRG-T-LP-163104); and
- Existing and Proposed Sections (167037-TGP-26-MVL3-DRG-T-LP-163105).

7. IMPACT OF PROPOSALS

7.1 Uppermill Viaduct (MVL3/31)

7.1.1 The attachment of OLE infrastructure to the grade II listed Uppermill Viaduct (MVL3/31) is in order to deliver the electrification of the Transpennine route as part of the wider TRU Programme. These works would result in some minor physical intervention into the structure comprising the attachment of seven OLE portals to the viaduct and resulting alteration of its appearance, however due to the considered and sensitive approach to design, the proposed works would have limited impact on the overall significance of the viaduct.

7.1.2 Attachment of the OLE brackets would require the coring of eight 80mm holes into the spandrels each side of the viaduct over piers 5, 8, 11, 14, 17, 20 and 25, the insertion and grouting of stainless steel bars into these to enable attachment of the brackets and OLE portals. This would result in very minor impacts to the fabric of Uppermill Viaduct (MVL3/31) and would not impact any architectural features, being set below the level of the stringcourse and avoiding the arch voussoirs.

7.1.3 The presence of the OLE portals and bracketry would introduce new elements on the viaduct, altering its appearance, however, the extent of this impact on its aesthetic value is limited. The OLE portals are proposed to be sited to avoid the wider spans over Den Lane and the Huddersfield Narrow Canal and High Street (A670), being set back from these by a single, narrower span to either side (Insert 6-3 and **Insert 6-4**). This would minimise intrusion from the presence of the OLE portals in views of the structure along these important viewing corridors.

7.1.4 The architectural features, form and massing of the viaduct would continue to be appreciable following the installation of the OLE portals, and whilst the portals would form a modern intervention into the structure, they are proposed to be placed to respond to the architectural rhythm of the viaduct thus not detracting from its form. The significance which Uppermill Viaduct (MVL3/31) derives from its aesthetic value would therefore be maintained.

7.1.5 The proposed OLE portals would be installed in less visible locations where vegetation would largely obscure visibility from the setting of the viaduct. These measures would also ensure that the presence of the OLE portals would not be intrusive to the experience and views of the viaduct. The relationship of the Huddersfield Narrow Canal and particularly Lock 23 and the tailbridge would continue to be understood and appreciated in views along the canal. OLE bracketry would be visible in the limited oblique views along the elevations of Uppermill Viaduct (MVL3/31), however, these would be located up to c.15 m above ground level, forming a minor element in appreciation of the viaduct as a whole.

7.1.6 The proposed works would not affect the historic value of Uppermill Viaduct (MVL3/31) resulting from its association with the engineer A.S. Jee, the railway companies of the Huddersfield & Manchester Railway and LNER, and the Heroic Age of railway building (1841-1850). The features which contribute towards these associations namely the overall form, massing, architectural features and monumental presence of the viaduct in Uppermill would remain wholly legible following the installation of the OLE portals.

7.1.7 The group value of the structure with other bridges designed by A.S. Jee for the Huddersfield & Manchester Railway would be maintained. Whilst the establishment of OLE portals and bracketry would result in changes to the appearance of the viaduct, A. S. Jee's original design would continue to be understood, maintaining the group value of the succession of Jee viaducts along this section of the Transpennine route. The installation of OLE portals is required to enable the modernisation of the railway line through its electrification, and forms part of the ongoing use and modernisation of the historic railway network and the next chapter in the story of the railway's development and improvement.

7.1.8 The proposed works would therefore result in a low level of less than substantial harm to the significance of Uppermill Viaduct (MVL3/31).

7.2 Other heritage assets

7.2.1 Whilst the proposed overhead lines would be visible above the viaduct deck in views towards Lock 23 and tailbridge No.75 (NHLE 1356719), these would not form a prominent or intrusive element. Oblique views of the OLE portals and brackets would be possible on the approach to the lock and tailbridge, however, these would be at considerable height above the listed structures and would not detract from understanding of the historic relationship between the canal and railway.

7.2.2 OLE portals may be visible in views towards Uppermill Viaduct (MVL3/31) from Huddersfield Narrow Canal Lock No. 22W (NHLE 1163263), Lower Brownhill House (NHLE 1309706) and Brownhill Bridge Mill (NHLE 1309426), these would not form prominent or intrusive elements within these views and would be filtered by mature vegetation. This would result in no impact upon the contribution of setting to the significance of these assets.

7.2.3 The addition of OLE portals to Uppermill Viaduct (MVL3/31) would not result in any appreciable impacts on the Uppermill Conservation Area. Whilst the proposals would alter the appearance of viaduct to a limited extent, the extent of this impact would be limited due to the considered placement of the portals to maintain key views along the Huddersfield Narrow Canal, Den Lane and High Street (A670). The landmark status of the viaduct within the conservation area would be maintained, as would understanding of the role of the railway in the development of the settlement and its inter-relationship with the canal. Its significance would remain wholly appreciable in the conservation area and as would the contribution that the viaduct makes to the character and appearance of the conservation area.

7.3 Mitigation

7.3.1 The design proposals have been developed to minimise impacts on the fabric, form and appearance of Uppermill Viaduct (MVL3/31). This has been achieved through a robust process of optioneering, undertaken in consultation with Historic England and OMBC. This has informed the proposed placement of the OLE portals and brackets to reflect the architectural rhythm of the viaduct and to minimise physical intervention into the historic structure

7.3.2 During construction of the works, toolbox talks to disseminate best practice for reducing potential impacts in relation to construction activity associated with Uppermill Viaduct (MVL3/31) would also be delivered, for example to help avoid accidental damage.

Recommended compensation

7.3.3 In addition to these embedded measures, additional mitigation secured through the use of listed building consent conditions is recommended comprising:

- A scheme of historic building recording to Level 1 standards in accordance with Historic England guidance (Historic England, 2017). This would provide a permanent record of Uppermill Viaduct (MVL3/31) in its current form and be lodged with the Greater Manchester Historic Environment Record.
- A scheme of permanent heritage interpretation would be developed and installed adjacent to Greenfield Station. This would provide the opportunity to engage members of the public with the heritage of the Huddersfield & Manchester Railway including the historic structures designed by A. S. Jee, such as Uppermill Viaduct (MVL3/31). Further engagement with stakeholders with respect to the content of the interpretation would be undertaken during the detailed design phase.

7.4 Public benefit

7.4.1 The works proposed to be undertaken to Uppermill Viaduct (MVL3/31) are required to ensure the realisation of the substantial public benefits of the Order Scheme.

7.4.2 As part of the wider TRU Programme, the Order Scheme would directly and indirectly play a role in improving regional connectivity and enhancing of some of Britain's busiest rail network, in turn realising economic, social and environmental objectives of the programme. The Transpennine route is identified as a key transport corridor, providing connections between cities in the North of England. The improvements in connectivity delivered by the TRU programme will support aspirations for economic growth and "levelling up" opportunities across the North of England.

7.4.3 The key objectives of the TRU programme are to achieve the part electrification of the Transpennine Route, improve journey times and capacity between key destinations, improve overall reliability and resilience of the route, and provide environmental benefits from modal shift from road to rail freight reducing the number of heavy vehicles on the highway network and associated air pollution. The completion of the proposed works at Uppermill Viaduct (MVL3/31) would contribute towards this, delivering electrification of the railway line across the viaduct, thereby delivering increases in line speed, capacity and resilience.

7.4.4 Electrification would deliver faster journey times and improved performance by allowing trains to accelerate faster, and brake more efficiently. The Order Scheme will deliver faster line speeds (80 mph throughout), improving journey times along the Transpennine Route, aiming to provide an improved journey time from Leeds – Manchester Victoria of 42-44 minutes and York to Manchester Victoria of 65-67 minutes. Works to the track and structures along the Route, including Uppermill Viaduct (MVL3/31), are required to accommodate this increase, and without these changes the Scheme would be unable to go ahead.

7.4.5 As a vital constituent part of the Order Scheme, the proposed works at Uppermill Viaduct (MVL3/31) would also facilitate indirect benefits associated with the wider programme of works, including station upgrades, track renewal and signalling improvements.

7.4.6 The reliability and resilience of the route and services operating on it will be improved by replacement of existing infrastructure with electrification equipment, new track drainage and signalling. Modern signalling equipment will reduce the headway between trains, allowing them to run closer together which will in turn provide increased capacity. The Scheme will provide the capability to operate four ‘express’, two ‘semi-express’ services and up to two local services an hour on the Route and will provide increased flexibility to timetable more train paths.

7.4.7 Electrification of the Scheme would provide substantial environmental and sustainability benefits and is an investment in ‘greener’ energy technology. This supports Network Rail’s Decarbonisation Strategy and is bolstering national targets for reducing harmful emissions that cause climate change, which are set out in Government legislation for achieving net zero carbon by 2050.

7.4.8 The Order Scheme will also deliver improved safety through measures including replacement of two level crossings, installation of additional safety measures on existing bridges; enhancements to the local highway networks and new pedestrian crossing points at locations including Greenfield and Mossley Stations. Accessibility of the railway network will also be improved with the provision of fully accessible stations at Greenfield Station and the relocated Mossley Station. These measures are being brought forward as part of the wider TRU Scheme to electrify and modernise the Route, as facilitated, in part, by the works to Uppermill Viaduct (MVL3/31).

7.4.9 Significant residual beneficial effects arising from the operation of the wider TRU Scheme have been previously identified in the Huddersfield-Westtown TWA Order Inquiry from December 2021.

These included recognition of improved journey times, reliability, and capacity at the Local Authority area and in turn the sub-regional and regional level. These improvements will bring direct significant benefits to local businesses and the labour market through improved access to the local regions along the section of the route from Stalybridge to Diggle.

7.4.10 To this effect, the proposals at Uppermill Viaduct (MVL3/31) are therefore essential in achieving the overall substantial public benefits of Route Section W2B and wider objectives of the Order Scheme, and without these interventions, the Order Scheme would not be able to be safely and successfully implemented. Alongside these substantial public benefits, the delivery of heritage interpretation adjacent to Greenfield Station would enable public engagement with the heritage of the Huddersfield & Manchester Railway, its architecture and significance.

8. CONCLUSION

8.1.1 The significance of Uppermill Viaduct (MVL3/31) lies primarily in its historic and architectural interest. The viaduct's dates to the Heroic Age (1841-1850) of railway building and demonstrates the high-quality design and craftsmanship of A.S. Jee's work for the Huddersfield & Manchester Railway, of which notable features include the monumental scale, quality of its architectural detailing and construction and integration of skew spans over Den Lane, the Huddersfield Narrow Canal and High Street (A670). The viaduct therefore derives significance from this direct historical relationship with notable railway engineer A.S. Jee and the historic railway companies namely the Huddersfield & Manchester Railway and LNWR. The setting of Uppermill Viaduct (MVL3/31) contributes to the significance of the structure, and particularly in its relationship with the canal. It also possesses group value as one of a number of A.S. Jee viaduct along Transpennine route which share a common design language.

8.1.2 The proposals to erect seven OLE portals and bracketry across Uppermill Viaduct (MVL3/31), will result in some localised changes to the structure, however, these have been developed through a robust optioneering process, undertaken in consultation with Historic England and OMBC and designed to minimise impact on the significance of the listed building as far as possible. These works would result in minor alteration of the structure, although the design measures have sought to preserve key aspects of its significance including its architectural quality, detailing and construction. Whilst the proposals would introduce modern materials into the fabric of the structure, these works are limited in extent and would be developed to be as visually unobtrusive as possible. The group value of Uppermill

Viaduct (MVL3/31) with other viaducts designed by A.S. Jee for the Huddersfield and Manchester Railway would be maintained.

8.1.3 The proposals would result in less than substantial harm to the significance of Uppermill Viaduct (MVL3/31), as defined under the NPPF in paragraph 215. These impacts are deemed necessary in order to deliver the TRU programme, and would enable the achievement of key improvement objectives as outlined in Section 7.4. It would also support the achievement of substantial public benefits related to:

- Improved efficiency and reliability of the railway (in journey time saving and increased capacity);
- Reduction of delays to trains and other highway users (improved efficiency of the railways means fewer heavy vehicles on the highway network causing traffic issues and contributing to air pollution);
- Supporting sustainable transport development in line with Network Rail's Decarbonisation Strategy; and
- Improving public health and safety in providing safe routes across the railway.

8.1.4 In addition to this, the delivery of a programme of heritage interpretation at Greenfield Station would provide the opportunity for engagement of the public with the heritage of the Huddersfield & Manchester Railway.

8.1.5 These substantial public benefits would outweigh the less than substantial harm to the significance of Uppermill Viaduct (MVL3/31). The proposals therefore meet the requirements of the NPPF (paragraph 215) in relation to the justification for less than substantial harm. The proposals would also satisfy the requirements of Policy 24 of the Oldham Joint Core Strategy and Development Management Policies (2011), in relation to the impact on the character of the listed building, and preservation of its architectural style and features. It would also satisfy Policy JP-P2 contained within Greater Manchester Combined Authority's Places for Everyone (2024). The proposals therefore satisfy both national and local policy requirements in relation to the justification for harm to significance of Uppermill Viaduct (MVL3/31).

Official list entry

Heritage Category:	Listed Building
Grade:	II
List Entry Number:	1068120
Date first listed:	02-Jul-1986
List Entry Name:	UPPERMILL VIADUCT
Statutory Address 1:	UPPERMILL VIADUCT, 31, UPPERMILL

Location

Statutory Address:	UPPERMILL VIADUCT, 31, UPPERMILL

The building or site itself may lie within the boundary of more than one authority.

District:	Oldham (Metropolitan Authority)
Parish:	Saddleworth
National Grid Reference:	SD 99579 06310

Details

SADDLEWORTH UPPERMILL SD 9906 9/342 No. 31 Uppermill Viaduct (also known as Uppermill Arches and Saddleworth - Viaduct) G.V. II Railway viaduct. 1849. By A S Jee Huddersfield and Manchester Railway Co. Rock-faced stone. Total of 23 arches. Each arch is semi-circular, has rusticated voussoirs, and is supported on a rectangular pier with projecting plinth and springing band. 3 of the arches are skew and flanked by flat pilasters; they are Nos. 9, 15 and 21 (counting from the south). This was already part of the LNWR before completion.

Our ref: PA01200823

25 June 2024

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the pre-application meetings over the last five months. These have been extremely useful in explaining the significance of the heritage assets, the design team's approach, and in exploring issues and constraints associated with electrifying the track.

This letter covers our advice regarding proposals for change to eight listed railway structures between Stalybridge and Standedge Tunnel, within the Metropolitan boroughs of Tameside and Oldham in Greater Manchester. This section of the railway is referenced as W2B.

Significance

The section of railway between Stalybridge and Standedge Tunnel was constructed in stages between 1844 and 1849. This was at the height of "railway mania"; an intense period of activity when many competing companies formed and were racing to complete sections of railway. The Stalybridge and Standedge Tunnel railway eventually became part of a wider network of sections of track that extends from Selby and York to Manchester Victoria via Leeds.

The W2B route has considerable heritage value. It traverses areas of dramatic landscape and varied geology, and has remained well preserved and largely unaltered since its opening in the 1840s. The wider railway network from the Yorkshire cities to Manchester contributed hugely to the economic and urban development of the North and was a major factor in the industrial revolution and in the development of towns.

SUITES 3.3 AND 3.4 CANADA HOUSE 3 CHEPSTOW STREET MANCHESTER M1 5FW
Telephone 0161 242 1416
HistoricEngland.org.uk

Historic England is subject to both the Freedom of Information Act (2000) and Environmental Information Regulations (2004). Any information held by the organisation can be requested for release under this legislation.

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

The tricky geology and terrain of the W2B route presented challenges to the engineers of the 1840s, and many of the most notable surviving features of the railway are the impressively engineered bridge and viaduct structures. These structures are predominantly built from locally sourced stone, meaning they harmonise with the landscape and contribute to local views, adding to the aesthetic value of the route. The significance of the structures also lies in the fact that they survive well and in large numbers. There have been few alterations to bridges, mainly because this section of the line has not been widened as other parts of the wider route have been.

There are eight listed railway structures that will be affected by the proposed electrification works between Stalybridge and Standedge Tunnel; these are:

- Heyrod Hall Overbridge - MVL3/7
- Heyrod Footbridge Overbridge - MVL3/8
- Spring Bank Lane Overbridge - MVL3/9
- Roughtown Road Overbridge - MVL3/17
- Wright's Mill Overbridge - MVL3/20
- Wright's Overbridge - MVL3/23
- Oldham Road Overbridge - MVL3/28
- Saddleworth Viaduct - MVL3/31

All eight of the listed structures were designed by notable railway engineer Alfred Stanistreet Jee, lead engineer for the railway between Huddersfield and Manchester. They were built in the mid-late 1840s and share many architectural characteristics, adding to their group value and enhancing their significance.

Bridges MVL3/7, MVL3/9, MVL3/17, MVL3/20, MVL3/23, and MVL3/28 are all very similar in design. All are made from coursed local sandstone and have segmental arches formed from tooled voussoirs, with larger keystones. Each has dressed ashlar impost bands, sloping string courses above the arch, and parapet copings, with shallow pyramidal caps to the slender piers. They have considerable group value and are easily identifiable in the landscape as bridges associated with the original construction of the railway. The bridges are all well designed and adapted to their individual locations, some being skewed or sloped. High quality workmanship and

https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

details such as picked and tooled ashlar voussoirs elevate their design above what is purely function, enhancing their significance further.

Heyrod Footbridge (MVL3/8) and Saddleworth Viaduct (MVL3/31) are clearly recognisable as part of the same scheme of work but differ in their form. Heyrod Footbridge features a flat span, and retains its cast-iron edge beams and brick parapets, while Saddleworth Viaduct comprises 23 sandstone arches spanning the River Tame and Huddersfield Narrow Canal.

The structures are all Grade II listed in recognition of their special architectural and historic interest at national level. Saddleworth Viaduct was listed in 1986, while all seven overbridges were listed in 2017 or 2018 after a comprehensive review of the line.

Impacts

The proposals involve demolition and reconstruction of three structures, total removal of one structure, and modifications to four structures. These works are deemed necessary to achieve the clearance required for the OLE (overhead line equipment) and to ensure safety for bridge users. The impacts of proposed works at each structure are discussed below.

Bridges requiring demolition works:

Heyrod Hall Overbridge MVL3/7 carries a short section of private road over the railway to Heyrod Hall. This bridge is in a rock cutting with very hard rock beneath the track, prohibiting track lowering.

Wright's Mill Overbridge MVL3/20 carries the public footpath and bridleway over the railway where it passes through a steep-sided rock cutting. Options to lower the track at this bridge have been investigated but discounted due to the location on the bridge in a rock cutting with very hard rock beneath. Track lowering would also have a knock-on effect to a nearby underbridge.

Oldham Road Overbridge MVL3/28 is a skew overbridge located on the north-east side of Greenfield Station and carries Oldham Road over the track below. There will be

Historic England is subject to both the Freedom of Information Act (2000) and Environmental Information Regulations (2004). Any information held by the organisation can be requested for release under this legislation.
We respect your privacy and the use of your information. Please read our full privacy policy for more information
https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

the addition of a new footbridge alongside the reconstructed road bridge. Options to lower the track at this bridge have been investigated but would be difficult to achieve due to the proximity to the station.

Proposals at these three bridges involves the complete dismantling of each bridge and reconstruction to create a raised, flat deck with sufficient clearance for OLE. Stone would be reclaimed and used to clad the inside faces of parapet walls; however matching stone is likely to be needed to clad the external sides of the parapets. New copers would also be needed to ensure parapets were the correct height.

The demolition and reconstruction of these bridges will cause substantial harm to their significance through the total loss of historic form and loss of much of their original fabric. The proposals will also diminish the group value of the historic bridges on the railway.

Wright's Overbridge MVL3/23 is a footbridge that carries a public footpath from north-west to south-east across the railway. The railway here is in a steep cutting and due to gradients, the bridge slopes down towards the south-east. Proposals involve the total removal of this bridge and diversion of the public right of way across the railway at another point.

The removal of Wright's Overbridge will cause substantial harm to its significance through the total loss of its historic form and all original fabric. Its removal will necessitate the re-routing of a historic public footpath, which is part of a network of paths in the area connecting mills and farms with workers' housing, and contributes to the landscape character of the area and to the setting of the bridge. The proposals will also further diminish the group value of the historic bridges on the railway.

Bridges requiring modifications:

Heyrod Footbridge Overbridge MVL3/8 carries a footpath running east-west over the railway, with steps on the eastern side down to a path running south-east towards Spring Bank Lane which are also listed.

Spring Bank Lane Overbridge MVL3/9 (also known as Heyrod Bridge) carries Spring Bank Lane over the railway. Due to the lie of the land the bridge slopes down towards the east. The splayed projecting wing walls are also covered by the listing.

Historic England

Roughtown Road Overbridge MVL3/17 carries Roughtown Road north-south across the railway, to the east of Mossley Station. Due to gradients the deck slopes down towards the south. The projecting wing walls are also covered by the listing.

Minimal interventions are proposed at these three bridges, the most significant changes being the introduction of new triangular copers to ensure the correct and safe parapet heights.

The introduction of triangular copers to raise the parapet heights to 1.5m will result in a low level of less than substantial harm to the significance of the bridges through the changes to their appearance and the loss of original copers. This harm could be further lowed by using stone copers instead of concrete, and by undertaking any other restoration works required such as replacing the recently rendered section of parapet copings in the south-west corner of Roughtown Road Bridge.

Saddleworth Viaduct MVL3/31 (also known as Uppermill Arches and Uppermill Viaduct) carries the railway over a series of roads and lanes, and the River Tame and Huddersfield Narrow Canal. Due to the lack of space available on the viaduct deck, proposals here involve attaching brackets to the exterior of the viaduct for the OLE supports.

The proposed works at Saddleworth Viaduct will result in a low level of less than substantial harm to the significance of the structure through the change to its appearance and in the physical impact on the elevations of the viaduct from the brackets. This harm could be further lowed by ensuring the spacing of the masts responds to the structural and architectural rhythm of the viaduct to lessen their visual impact.

Policy

National policy relating to the conservation and enhancement of the historic environment is articulated in section 16 of the National Planning Policy Framework (NPPF, 2023). These policies state that heritage assets are an irreplaceable resource and should be conserved in a manner appropriate to their significance, so they can be enjoyed for their contribution to the quality of life of existing and future generations (NPPF para 195). Also, when considering the impact of a proposed development, great weight should be given to an asset's conservation (NPPF para 205).

SUITES 3.3 AND 3.4 CANADA HOUSE 3 CHEPSTOW STREET MANCHESTER M1 5FW
Telephone 0161 242 1416
HistoricEngland.org.uk

Historic England is subject to both the Freedom of Information Act (2000) and Environmental Information Regulations (2004). Any information held by the organisation can be requested for release under this legislation.
We respect your privacy and the use of your information. Please read our full privacy policy for more information
https://www.historicengland.org.uk/terms/privacy-cookies/

Historic England

Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification (NPPF 206).

Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss. In practice this means that less harmful alternative solutions should be explored through the pre-application and application processes.

In addition to section 16 of the NPPF, we refer you to Section 12 'Achieving well-designed and beautiful places' when considering the design for replacement bridge structures. Para 132 states that being sympathetic to local character and history is important, along with a consistent and high-quality standard of design (para 133).

Position

The proposed works to upgrade the W2B section of the Transpennine route network will be the first major programme of work since its construction in the 1840s. The wider public benefits of the upgrade work to this key transport network will be vast and will have positive knock-on effects across the region. The challenging geology and hydrology across the route still present issues to engineers today, and we welcome the work that has gone into investigating alternative options to demolition and reconstruction for the bridges affected.

The proposals will result in substantial harm to the significance of bridges MVL3/7, MVL3/20, MVL3/23, and MVL3/28, with the highest level of harm to bridge MVL3/23 which will be dismantled and not reconstructed. The proposals will cause harm through the loss of the form of the arched bridges and though the loss of historic fabric. There will be the additional harm to the group value of the bridges.

We agree that the bridges are predominantly experienced from the bridge deck, and that re-use of original fabric should be focussed on the inside faces of the parapet walls to ensure the look of the bridge when crossing it is not unacceptably altered, however this re-use of materials does not lower the harm to less than substantial levels. It will be for decision takers to weigh the balance of this substantial harm against the public benefits of the scheme.

Historic England

Works to bridges MVL3/8, MVL3/9 and MVL3/17 is largely limited to raising the parapets to ensure they are the safe and correct height. We acknowledge that Network Rail has a legal obligation to take reasonable steps to prevent people from coming into contact with the OLE by ensuring parapets cannot be climbed or walked on. We appreciate the work undertaken to investigate various options for different types of pantographs to limit the height at which the parapets need to be raised to. The use of triangular copers will introduce a change in the appearance of the bridges and cause a low level of less than substantial harm to their significance, but the impact can be lessened by use of stone rather than concrete copers which will be less visually obtrusive. Parapet design should be tailored to the individual circumstances of each bridge to ensure the least harmful solution is used.

There will also be a low level of less than substantial harm at Saddleworth Viaduct from the introduction of brackets to the structure to support the OLE. This can be further lowered by thoughtful spacing of the brackets.

We welcome the detailed options appraisals undertaken during the design of the proposed works to listed structures on the W2B route. We recommend that details are finalised using bespoke designs that respond to the particular character of each structure and its setting.

Next Steps

Thank you for involving us at the pre-application stage of this project. The above advice is the response that we would give if the same proposals were put forward unamended for statutory approval.

Yours sincerely

Louise Davies

29 November 2024

Dear Kate

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the meetings on 6 and 21 November 2024 to review the proposals for bridges MVL3/9, 10, 23, 25, 26, 28, 29 and 31. As before, it was helpful to see the drawings in advance and then talk through the proposals with the team.

The impacts of the proposed changes and our comments are detailed below:

Proposals at *Manchester Road underbridge MVL3/10*, *Shaw Hall Bank Road underbridge MVL3/26* and *Wickens underbridge MVL3/29* will involve minor works, consisting of renewal of railings and strengthening of parapets with reinforced concrete. Visually, there will be only a minor impact, as the replacement railings are similar to the existing and the concrete strengthening will be hidden from view by the parapets. There will be a very low level of less than substantial harm to the physical fabric of the bridges due to the new railings being grouted into cored holes in the masonry parapet blocks. We do not have concerns over the works at these three bridges and recognise the efforts to maintain the visual appearance on the bridges.

The proposals for *Spring Bank Lane overbridge MVL3/9* and *Uppermill Viaduct MVL3/31* have been discussed at previous meetings, and it was helpful to see further details of the works at these structures. There will be a low level of less than substantial harm to *Spring Bank Lane overbridge* due to the introduction of raised copers, however the use of colour-matched concrete here will help to mitigate some of the harm caused by the visual impact of the new copers. Works to *Uppermill Viaduct* will likewise lead to a low level of less than substantial harm due to the introduction of brackets to support the OLE portals which will have an impact both physically and visually. We appreciate that care has been taken in the spacing of these portals so the rhythm of the bridge arches is not unduly interrupted, and so that the pattress plates are not affected.

More considerable impacts will result from proposals at *Wright's overbridge MVL3/23*, *Oaklands Road underbridge MVL3/25* and *Oldham Road overbridge (Greenfield*

Historic England

Station) MVL3/28, all of which will result in substantial harm to the significance of the designated assets.

As mentioned in previous letters, the removal of *Wright's Overbridge* will cause substantial harm to its significance through the total loss of its historic form and all original fabric, and through the re-routing of a historic public footpath. Thorough justification will need to be presented in the supporting documentation to provide the reasoning for the total loss of this bridge.

The proposed reconstruction of *Oldham Road Overbridge* has also been discussed previously. This is a skew overbridge located on the north-east side of Greenfield Station which carries Oldham Road over the track below. The bridge currently has a masonry arch which will be dismantled, along with much of the approaching wing walls, resulting in very little historic fabric being retained. The works will also necessitate the removal of the ornate historic iron railway footbridge. There will be substantial harm to the significance of the listed asset due to the severity of changes to its physical appearance and the loss of historic fabric. We recognise that some fabric will be retained for reuse as cladding material, however this will need to be carefully managed to maintain the look of the structure. The stone coursing in the existing bridge runs through the parapets into the wing walls. We would like to see care taken to replicate this effect within the reconstructed bridge to avoid a disjointed appearance to the new structure, which could arise from using mismatched stone-cladded panels. The existing bridge features flat masonry pilasters that project slightly from the bridge to either side of the arch. These have not been articulated in the proposed design and we would like to see further investigation into whether they could be incorporated into the design. This location would be suitable for display of permanent interpretation materials which could help to mitigate some of the harm by informing the public about the history of the route and the upgrade works.

Oaklands Road underbridge MVL3/25 is a skew girder bridge carrying the two-track railway line over a bend in the road below. The angled abutments have distinctive semi-octagonal piers, and the parapets are ornate balustrades of decorative cast-iron panels of Gothic arcading. The craftsmanship of the stonemasonry and attention to architectural detail lifts the design of this bridge above the purely functional and it has considerable architectural interest. There will be substantial harm to the significance of this listed bridge resulting from the proposals to reconstruct and widen the bridge deck and to rebuild the octagonal piers. In order to minimise the harm, the design of the rebuilt piers and abutments will need to be careful managed to ensure there is meaningful articulation of the distinctive shape of the piers. This includes the contrasting shape and dimensions of the piers where they extend through and above the parapet. We are comfortable with the proposals to replicate the decorative cast-iron panels to minimise the visual impact of the loss of the original fabric here.

Our ref: PA01200823
18 July 2025

Dear Sarah

Pre-application Advice

TRANSPENNINE ROUTE UPGRADE - STALYBRIDGE TO STANDEDGE

Thank you for arranging the recent meetings to review the draft Heritage Statements that will be submitted for Listed Building Consent applications for changes to bridges on the proposed Transpennine Route Upgrade line.

The Heritage Statements are well considered and it is clear that alternative options to reconstruction have been investigated in each case, which are helpfully set out in tables in the reports. The proposals will result in substantial harm to listed bridges along the route, however clear justification for this has been set out in the Heritage Statements.

We very much welcome the inclusion of heritage interpretation at Greenfield Station. This is a significant early rail route and there is notable educational potential in the material that has been generated from the research into the railway structures as part of this project.

Regarding Oaklands Road underbridge MVL3/25, we are comfortable with the design of the proposals for the reconstruction of the parapet and stone turrets. These have been carefully considered to minimise the visual impact.

Next Steps

We appreciate having been involved at pre-application stage in this important project, and value being able to feed into design plans. If you require further pre-application advice please get in touch.

Yours sincerely

1. INTRODUCTION

1.1 The Transpennine Route Upgrade

1.1.1 The Transpennine Route Upgrade (TRU) is a rail enhancement programme established to increase capacity and improve reliability/journey times between Manchester Victoria and York, via Huddersfield and Leeds.

1.1.2 The TRU will aim to deliver:

- An improved journey time for Leeds – Manchester Victoria of 41-42 minutes;
- An improved journey time for York to Manchester Victoria of 63-66 minutes;
- The capability to operate four ‘express’ and two ‘semi-express’ services an hour on the route;
- The capability to operate up to two ‘local services’ an hour on the route;
- The performance of the Transpennine Route to be 92.5% or higher each period;
- Freight paths/rights to be retained as existing; and
- A contribution to Network Rail’s Decarbonisation Strategy and climate policy.

1.1.3 The Network Rail (Stalybridge to Diggle (Saddleworth) Enhancement Order extends from Stalybridge Tunnel, in the west, through to the western portal of Standedge Tunnel (the Order Scheme). This section of the Transpennine Route follows the Tame Valley from Stalybridge to Diggle and is referred to hereafter as Route Section W2B.

1.1.4 The TRU programme involves a variety of works including the electrification of the railway (installation of overhead line equipment (OLE) and associated infrastructure); removal, re-modelling, and replacement of bridges and structures to accommodate OLE, track and signalling upgrades, and structural strengthening works. Where level crossings are affected by the improved services proposed, TRU also involves level crossing closures and, where necessary, their replacement by safer alternative.

1.1.5 The Transport and Works Act 1992 introduced section 12(3A) into the Planning (Listed Buildings and Conservation Areas) Act 1990, the effect of which is to ’call-in‘ for determination by the Secretary of State applications to the local planning authority for listed building consent where such consent is required in consequence of proposals included in an application for a Transport and Works Act Order (TWAO). The procedures in the Transport and Works Applications (Listed Buildings, Conservation Areas

and Ancient Monuments Procedure) Regulations 1992 then apply to the call in of such listed building consent applications.

1.2 Report Objectives

1.2.1 This Heritage Assessment has been prepared to establish baseline conditions for the historic environment across the Scheme boundary, to inform assessment of impact for those works included within the TWAO, development of mitigation proposals, and consultation with Heritage regulators. This assessment has been prepared to consider the extent of the Route Section W2B from Stalybridge to the Eastern Portal of Standedge Tunnel.

1.2.2 The requirement for this assessment and its scope is guided by policy contained within the National Planning Policy Framework (NPPF) (MHCLG 2024) and Network Rail's Environment and Social Minimum Requirements for Projects – Design and Construction (NR/L2/ENV/015, Volume 3, Appendix 1A of this Report [**NR14**]). It addresses NPPF paragraph 207, Section 16 which require an assessment proportionate to the asset's importance and sufficient to understand the potential impacts of development and to appraise the nature and extent of any impact upon setting and significance.

1.2.3 This assessment aims to:

- Summarise legislation, policy and guidance relevant to historic environment assets and the appraisal of their significance;
- Place the Order Scheme within its historical and archaeological context through the collation of baseline information;
- Identify and contextualise known designated and non-designated heritage assets in proximity to the relevant works elements of the Order Scheme;
- Assess the potential for, and likely significance of, previously unrecorded archaeological or remains or deposits that may be located within the study area;
- Assess the significance of potentially affected heritage assets within the Order Scheme and study area, including the group value of assets and the contribution made by their setting;
- Provide a high-level assessment of potential impacts to heritage assets as a result of the Order Scheme; and
- Identify potential mitigation measures to reduce or offset impacts to heritage assets as a result of the Order Scheme.

1.2.4 This Historic Environment Assessment principally considers archaeological remains and historic landscapes which pre-date the railway and associated features.

1.2.5 Detailed assessments of individual listed buildings, including railway bridges, is provided in the sequence of Heritage Statements compiled in support applications for listed building consent in respect of the proposed works included in the application for a TWAO (refer to Volume 3, Appendix 5A of this Report [**NR14**]).

1.2.6 Potential impacts on heritage assets resulting from PDR works are not subject to assessment in this report. Any such impacts would be managed in accordance with the requirements included in NR/L2/ENV/015, Volume 3, Appendix 1A of this Report [**NR14**]. This would include the preparation of a heritage assessment as part of the management plans in consultation with the relevant local and statutory authorities, and the undertaking of the works to avoid disturbance of archaeological remains and historic buildings.

1.2.7 Potential impacts on heritage assets resulting from PDR works are not subject to assessment in this report. Any such impacts would be managed in accordance with the requirements included in NR/L2/ENV/015, Volume 3, Appendix 1A of this Report [**NR14**]. This would include the preparation of a heritage assessment as part of the management plans in consultation with the relevant local and statutory authorities, and the undertaking of the works to avoid disturbance of archaeological remains and historic buildings.

2. LEGISLATION AND POLICY CONTEXT

2.1 Legislation

Ancient Monuments and Archaeological Areas Act 1979 (as amended)

2.1.1 The Ancient Monuments and Archaeological Areas Act (1979) ('the Act') is the central piece of legislation for the protection of the archaeological resource. The Act makes provision for the investigation, preservation and recording of matters of archaeological or historical interest and regulates operations or activities which may affect them. The first section of the Act requires the Secretary of State for National Heritage to maintain a schedule of nationally important sites.

2.1.2 For the purpose of the Act, a monument is defined as:

> "a) any building, structure or work, whether above or below the surface of the land, and any cave or excavation; b) any site comprising the remains of any such building, structure or work or of any cave or excavation; and c) any site comprising, or comprising the remains of, any vehicle, vessel, aircraft or other moveable structure or part thereof which neither constitutes or forms part of any work which is a monument as defined within paragraph a) above; d) and any machinery attached to a monument shall be regarded as part of the monument if it could not be detached without being dismantled' (Section 61 (7))."

2.1.3 The Act further defines an ancient monument as:

> "any Scheduled Monument; and any other monument which in the opinion of the Secretary of State is of public interest by reason of the historic, architectural, traditional, artistic or archaeological interest attaching to it' (Section 61 (12))."

2.1.4 The Ancient Monuments and Archaeological Areas Act 1979 imposes a requirement for Scheduled Monument Consent for any demolition, destruction, or damage to the monument; alterations or repairs that affect the monument's character; and/or excavation or other groundworks that disturb the Scheduled Monument.

Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended)

2.1.5 The Planning (Listed Buildings and Conservation Areas) Act 1990 (as amended) ("Act") governs the designation and works to listed buildings in England.

2.1.6 The Act states in s.1 (5):

2.1.7 'In this Act "listed building" means a building which is for the time being included in a list compiled or approved by the Secretary of State under this section; and for the purposes of this Act—

a) *any object or structure fixed to the building;*

b) *any object or structure within the curtilage of the building which, although not fixed to the building, forms part of the land and has done so since before 1st July 1948, shall be treated as part of the building.'*

2.1.8 Under the Act, no one is permitted to undertake or cause to be undertaken any works that would affect the character of a listed building unless the works are authorised. Section 16 of the Act identifies that whether such works can be carried out is determined by the local planning authority or the Secretary of State:

> *'(1) Subject to the previous provisions of this Part, the local planning authority or, as the case may be, the Secretary of State may grant or refuse an application for listed building consent and, if they grant consent, may grant it subject to conditions.*
>
> *(2) In considering whether to grant listed building consent for any works the local planning authority or the Secretary of State shall have special regard to the desirability of preserving and enhancing the building or its setting or any features of special architectural or historic interest which it possesses.*

> *(3) Any listed building consent shall (except in so far as it otherwise provides) ensure for the benefit of the building and of all persons for the time being interested in it.'*

2.1.9 In relation to the granting of listed building consent , Section 17 of the Act stipulates listed building consent that conditions attached may include those with respect to:

> ' *the preservation of particular features of the building, either as part of it or after severance from it;*
>
> *the making good, after the works are completed, of any damage caused to the building by the works; [and]*
>
> *the reconstruction of the building or any part of it following the execution of any works, with the use of original materials so far as practicable and with such alterations of the interior of the building as may be specified in the conditions'.*

2.1.10 It is also defined in s.17 (2) that a condition 'may also be imposed requiring specified details of the works (whether or not set out in the application) to be approved subsequently by the local planning authority or, in the case of consent granted by the Secretary of State, specifying whether such details are to be approved by the local planning authority or by him'.

National Planning Policy Framework

2.1.11 The NPPF (MHCLG 2024) sets out the Government's planning policies for England and how these should be applied to contribute to the achievement of sustainable development.

2.1.12 Section 2 of the NPPF outlines the principles of achieving sustainable development including, in Paragraph 8, an environmental objective *'to protect and enhance our natural, built and historic environment'*. Paragraph 9 sets out that these objectives should be delivered through the preparation and implementation of plans and the application of the policies within the NPPF. Section 16 of the NPPF deals with conserving and enhancing the historic environment. Where changes are proposed, the NPPF sets out a clear framework to ensure that heritage assets are conserved, and where appropriate enhanced, in a manner that is consistent with their significance.

2.1.13 The NPPF sets out the importance of being able to assess the significance of heritage assets that may be affected by a development. Significance is defined in Annex 2 (MHCLG 2024) as being the *'value of a heritage asset to this and future generations because of its heritage interest. That interest may be archaeological, architectural, artistic or historic'*. Significance is not only derived from an asset's physical presence, but also from its setting. The setting of a heritage asset is defined in Annex 2 as, *'the surroundings*

in which a heritage asset is experienced. Its extent is not fixed and may change as the asset and its surroundings evolve'.

2.1.14 Paragraph 207 of the NPPF states that in determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand the potential impact of the proposal on their significance. Similarly, paragraph 208 includes a requirement on local planning authorities, having assessed the particular significance of any heritage asset that may be affected by a proposal, to take this into account when considering the impact of a proposal on a heritage asset.

2.1.15 Paragraph 210 states that 'in determining planning applications, local planning authorities should take account of the following points:

- *The desirability of sustaining and enhancing the significance of heritage assets and putting them to viable uses consistent with their conservation;*
- *The positive contribution that conservation of heritage assets can make to sustainable communities including their economic vitality; and*
- *The desirability of new development making a positive contribution to local character and distinctiveness*.

2.1.16 Paragraphs 212 to 216 and paragraph 220 of the NPPF introduce the concept that heritage assets can be harmed or lost through alteration, destruction or development within their setting. This harm ranges from less than substantial through to substantial. With regard to designated assets, paragraph 212 states that great weight should be placed on their conservation, irrespective of whether any potential harm is considered to be substantial or less than substantial. The paragraph goes further to say that the more important the asset, the greater the weight should be on conservation. In paragraph 213, a distinction is made in respect of those assets of the highest significance (e.g., scheduled monuments, grade I and grade II* listed buildings) where substantial harm to or loss should be wholly exceptional.

2.1.17 Paragraph 214 states that in instances where development would cause substantial harm to or total loss of significance of a designated asset, consent should be refused unless it can be demonstrated that it is necessary to achieve substantial public benefits that outweigh that harm or loss. Paragraph 215 states in instances where development would cause less than substantial harm to the significance of a designated asset, the harm should be weighed against the public benefits of the proposal to provide a balanced judgement.

2.1.18 With regard to non-designated assets, paragraph 216 states that the effect of the application on the significance of the asset should be taken into account in determining the application. A balanced judgement will be required having regard to the scale of any harm or loss and the significance of the heritage asset.

Planning Practice Guidance

2.1.19 The NPPF is supported by Planning Practice Guidance (PPG) on the Historic Environment (MHCLG 2019) which provides further advice and guidance that expands the policy outlined in the NPPF. It expands on terms such as 'significance' and its importance in decision making.

2.1.20 The PPG clarifies that being able to properly assess the nature, extent and the importance of the significance of the heritage asset and the contribution of its setting, is very important to understanding the potential impact and acceptability of development proposals (paragraph 008 Reference ID: 18a-008-20190723).The PPG states that in relation to setting, a thorough assessment of the impact on setting needs to take in to account, and be proportionate to, the significance of the heritage asset under consideration and the degree to which proposed changes enhance or detract from that significance and the ability to appreciate it (paragraph 009 Reference ID: 18a-009-20190723).

2.1.21 The PPG discusses how to assess if there is substantial harm. It states that what matters in assessing if a proposal causes substantial harm is the impact on the significance of the asset. It is the degree of harm to the asset's significance rather than the scale of the development that is to be assessed (paragraph 017). Generally, harm to heritage assets can be avoided or minimised if proposals are based on a clear understanding of the heritage asset and its setting (paragraph 008 Reference ID: 18a-008-20190723). The NPPF indicates that the degree of harm should be considered alongside any public benefits that can be delivered by development.

2.2 Local planning policy

Greater Manchester Combined Authority's Places for Everyone Joint development Plan 2022 to 2039

2.2.1 Places for Everyone is a long-term plan covering nine Greater Manchester districts (Bolton, Bury, Manchester, Oldham, Rochdale, Salford, Tameside, Trafford and Wigan) for jobs, new homes, and sustainable growth (GMCA 2024). The Places for Everyone Plan took effect and became part of the statutory development plan for the nine authorities on March 21, 2024. The plan supports the delivery of key infrastructure, while protecting important environmental assets.

2.2.2 Places for Everyone outlines the proactive management of the historic environment and heritage assets for their conservation, enhancement and sustainability within Greater Manchester.

2.2.3 Policy JP-P2: Heritage notes:

> '*We will proactively manage and work with partners to positively conserve, sustain and enhance our historic environment and heritage assets and their settings. Opportunities will be pursued to aid the promotion, enjoyment, understanding and interpretation of heritage assets, as a means of maximising wider public benefits and reinforcing Greater Manchester's distinct character, identity and sense of place. Local Plans will set out the key elements which contribute to the district's identity, character and distinctiveness and which should be the priority for conserving and enhancing in the future and demonstrate a clear understanding of the historic environment and the heritage values of sites, buildings or areas and their relationship with their surroundings. This knowledge should be used to inform the positive management and integration of our heritage by*:
>
> 1. *Setting out a clear vision that recognises and embeds the role of heritage in place-making;*
> 2. *Ensuring that the heritage significance of a site or area is considered in accordance with national planning policy in the planning and design process and opportunities for interpretation and local engagement are optimised;*
> 3. *Integrating the conservation and enhancement of heritage assets and their settings, with creative contextual architectural responses that contribute to their significance and sense of place;*

4. *Delivering positive benefits that sustain and enhance the historic environment, as well as contributing to the economic viability, accessibility and environmental quality of a place, and to social wellbeing; and*

5. *Exploring opportunities to reduce greenhouse gas emissions that restoration of historic buildings offer.*

Particular consideration will be given to ensure that the significance of key elements of the historic environment which contribute to Greater Manchester's distinctive identity and sense of place are protected from harm. These include historic town centres, places of worship, historic transport routes including the canal network, industrial buildings and structures including textile mills, farmsteads and other sites, buildings, and areas of identified archaeological, architectural, artistic and/or historic value.

Development proposals affecting designated and non-designated heritage assets and/or their settings will be considered having regard to national planning policy.

Where heritage assets have been identified as being at risk, Local Plans should identify specific opportunities for them to contribute to regeneration and place-making, and they should set out strategies for their repair and re-use. Development proposals which will help safeguard the significance of and secure a sustainable future for Greater Manchester's heritage at risk will be supported in principle, provided they are not contrary to national policy or other policies in the development plan.

Proposals should be informed, as necessary, by the findings and recommendations of the appropriate heritage assessment(s) in the development plan evidence base and/or any updated heritage assessment submitted as part of the planning application process.'

2.2.4 Policy JP-P3: Cultural Facilities notes:

'*We will proactively develop and support cultural businesses and attractions in our cities and towns through a range of measures, where appropriate, including*:

1. *Protecting existing heritage, cultural and community venues, facilities and uses; […]*

5. *Considering the use of vacant properties and land for pop-ups or meanwhile uses for cultural and creative activities during the day and at night-time to stimulate vibrancy and viability and promote diversity in town centres;*

6. *Maximising opportunities for redundant heritage assets and the role they can play in economic and social well-being. […]'*

Tameside Metropolitan Borough Council Unitary Development Plan

2.2.5 The Tameside Unitary Development Plan (UDP) (2004) contains the Council's land use planning policies. It is the main document which is used to determine planning applications for development in the borough. The UDP is the lead document of the Tameside Local Plan.

2.2.6 UDP policy sections in Conservation and Enhancement of the Built Environment relevant to the proposal include:

'*C1 Townscape and Urban Form*

In considering proposals for built development, the Council will expect the distinct settlement pattern, open space features, topography, townscape and landscape character of specific areas of the Borough to be understood, and the nature of the surrounding fabric to be respected. The relationship between buildings and their setting should be given particular attention in the design of any proposal for development. Urban design frameworks will be produced for particular areas and corridors in the Borough, as supplementary planning guidance, setting out fundamental principles which should be followed and from which detailed design may be interpreted. The Council will establish a strategy to secure the retention and enhancement of landmark buildings which form a distinctive element of the local skyline or townscape, and which represent a unique part of the heritage of the area. Re-use and conversion of such buildings which become redundant will be permitted, subject to other relevant policies.

C2 Conservation Areas

The character and appearance of the Borough's Conservation Areas, including any further changes to areas which may be declared during the life of the plan, will be preserved or enhanced through the control of development, the promotion of improvement measures, or both.

C3 Demolition of Unlisted Buildings in Conservation Areas

Demolition of unlisted buildings within Conservation Areas which make a positive contribution to the character or appearance of the area will not be permitted: Exceptions will only be made to this policy on assessment of each of the criteria listed in policy C8 for the control of demolition of listed buildings. Where unlisted buildings within Conservation Areas make no positive contribution to the character or appearance of the area, demolition will only be

permitted if this would be followed, as soon as practical, by a development scheme which would make a greater contribution to the character or appearance of the area.

C4 Control of Development in or adjoining Conservation Areas

When considering proposals for development in or adjoining Conservation Areas, including advertisements and the alteration, extension or conversion of existing buildings within Conservation Areas, the Council will have regard to the desirability of preserving or enhancing the character or appearance of the area, and to the need to ensure that the proposals make a positive contribution to the context in which they are set.

C5 Alternative Uses, Alterations and Additions for Listed Buildings

Whilst continuation of the use for which the building was designed is most desirable, the Council will permit alternatives uses for Listed Buildings where evidence demonstrates that the existing or original use is unlikely to support the maintenance and preservation of the building. The Council will require that proposed new uses, or other alterations and additions to Listed Buildings, should not adversely affect the essential character of the building, should be in keeping with its architectural style and features, and should harmonise with its surroundings. The effect of the proposals on any protected species which may be using the Listed Building should also be taken into account. Such development must be of a high standard of design. The external appearance, design and materials will be expected to match as near as possible those of the existing building and, where appropriate, new internal features should also harmonise with the existing. Extensions and additions should be secondary in scale, design and location to the principal building and standard solutions or modern features which fail to relate to the character of the building will not be permitted.

C6 Setting of Listed Buildings

New development, including any proposed as a result of a new use for a Listed Building, which fails to preserve, or detracts from, the setting of a Listed Building or structure will not be permitted.

C8 Demolition of Listed Buildings

The Council will not recommend the demolition of Listed Buildings, apart from in exceptional circumstances after the following considerations have been assessed: (a) the condition of the building and the cost of repairing and maintaining it in relation to its importance and to the value derived from its continued use, and (b) the adequacy of efforts that have been made to retain the building

in its present use or to find compatible alternative uses, and (c) the merits of alternative proposals for the site. In such circumstances the Council will also need to be satisfied that an acceptable alternative form of development can go ahead on the site as soon as practical following demolition, that any use of the building by protected species has been taken into account, and that provision can be made to record the detail of the building prior to demolition.

C10 Development Affecting Archaeological Sites

Where development is proposed which could have an adverse effect on Scheduled Ancient Monuments or other nationally important remains, there will be a presumption in favour of physical preservation in situ. Development will not be permitted if it would cause material damage to the existing remains, nor detract from the aesthetic, historical or educational value of the site and its setting. Where development is proposed in other areas of known or suspected archaeological importance, the Council will ensure that: (a) provision is made for the prior investigation and evaluation of the site, and (b) facilities are made available for suitable inspection during site preparation, and (c) sites and monuments are not needlessly damaged or destroyed, and unavoidable damage is mitigated, and (d) preservation of the archaeological evidence in situ is the preferred solution, or if this is not justified, adequate provision is made for excavation and recording before and during development. Wherever practical, measures should be taken to facilitate the conservation, accessibility and interpretation of archaeological remains, in the light of the educational, recreational and tourism potential which they may have.'

Additional UDP policies relevant to the development include Policy 1.2 Maintaining an Integrated Transportation Strategy, noting that 'Heavy rail improvements have been more modest but it is possible that the refranchising process currently underway for Trans-Pennine Express will lead to significant development of train services and station facilities in the Borough, depending on the investment programme agreed between the Strategic Rail Authority and the chosen operator'. Policy 1.5 Following the Principles of Sustainable Development notes principles including energy efficiency, limiting pollution, conserving the best of the built heritage, creating safe, clean environments, improving access to local services and more environmentally friendly travel alternatives.'

Oldham Metropolitan Borough Council Joint Core Strategy and Development Management Policies

2.2.7 Local planning policy for Oldham Metropolitan Borough Council (OMBC) is provided by the Joint Core Strategy and Development Management

Policies of the Oldham Local Development Framework, adopted in November 2011, and a small number of retained policies from the Unitary Development Plan (2006).

2.2.8 The Oldham Joint Core Strategy and Development Management Plan affirms that *'The council will protect, conserve and enhance these heritage assets and their settings which adds to the borough's sense of place and identity'*. Policy 24 of the Joint Core Strategy and Development Management Plan sets out the policies relating to the historic environment.

'*Policy 24 Historic Environment*

Oldham has a rich historic environment with many significant and valuable features, structures and characteristics. The council will protect, conserve and enhance these heritage assets and their settings which adds to the borough's sense of place and identity.

Development proposals must have regard to:

- *National and local guidance and policies on the historic environment.*
- *Oldham Rochdale Housing Market Renewal Pathfinder Heritage Assessments.*
- *Greater Manchester and Oldham Urban Historic Landscape Characterisation Study.*
- *Conservation Area Appraisals and Management Plans, where appropriate.*

When allocating sites and determining applications for planning and advertisement consents, the council will seek to protect, conserve and enhance the architectural features, structures, settings, historic character and significance of the borough's heritage assets and designations including:

(a) *Listed buildings.*

(b) *Conservation areas.*

(c) *Registered parks and gardens (their historic character and setting).*

(d) *Scheduled ancient monuments (their archaeological value and interest).*

(e) *Significant archaeological remains.*

(f) *Locally significant buildings, structures, areas or landscapes of architectural or historic interest*

(including non-designated locally significant assets identified in the local lists compiled by the council).

The council will support heritage-led regeneration, including the reuse of historic buildings such as mills, to achieve economic, community and regeneration objectives, where appropriate.

Listed Buildings

Development to, or within the curtilage or vicinity of, a listed building or structure must serve to preserve or enhance its special interest and its setting. There will be a strong presumption against proposals involving the demolition of listed buildings or structures. Proposals which would lead to the loss or cause harm to grade I and II listed buildings should be wholly exceptional.*

Development proposals for a building incorporating a historic shop front should make provision for its retention, restoration and repair.

Conservation Areas

Development within or affecting the setting of a conservation area, including views in or out, must serve to preserve or enhance the character or appearance of the area. Proposals for all new development, including alterations and extensions to buildings and their re-use, must have a sensitive and appropriate response to context and good attention to detail.

Proposals must not adversely affect important architectural or historic features or distinctive local features or structures unless it can be demonstrated that the development brings substantial benefits to the community.

Proposals for the demolition of a building in a conservation area must demonstrate that it is unrealistic for the building to continue in its existing use and a suitable alternative use cannot be found, or the building is in poor structural condition and the cost of repairing and maintaining it would be disproportionate to its importance and value and the demolition would preserve or enhance the character or appearance of the conservation area. In exceptional circumstances, the fact that a demolition would bring substantial benefits to the local community may outweigh the balance in favour of the preservation of the building.

Registered Parks and Gardens

Development which would lead to the loss of, or cause harm to, the historic character or setting of any part of registered park and garden will not be permitted.

Scheduled Ancient Monuments

Development which would lead to the loss of, or cause harm to, scheduled ancient monuments should be wholly exceptional.

Local Designations

Development which would affect the following designations will only be permitted in cases where it can be demonstrated that the benefits of the development brings substantial benefits to the community which outweigh the preservation of the heritage asset:

- *Significant archaeological remains*
- *Locally significant buildings, structures, areas or landscapes of architectural or historic interest*

The council will provide further advice and guidance on this policy. […]

In accordance with the objectives of national guidance, the council will protect, conserve and enhance the architectural features, structures, settings and historic character of the borough's heritage assets and designations including:

i. *Listed buildings – historic buildings identified by the Department of Culture, Media and Sport as being of special architectural or historic interest. There are over 500 listed buildings across the borough;*

ii. *ii. Conservation areas – statutory areas defined by national planning legislation as having special architectural or historic interest, the character or appearance of which it is desirable to preserve or enhance. There are currently 36 conservation areas in the borough designated at Alexandra Park, Alexandra Terrace Moorside, Oldham Town Centre (in East and West Oldham); Crompton Fold, Park Cottages Shaw, Saint James Shaw, Saint Pauls Royton (in Royton, Shaw and Crompton); Bottom of Woodhouses, Failsworth Pole, Garden Suburb, Woodhouses (in Failsworth and Hollinwood); The Old Town Hall Chadderton, Victoria Street Chadderton (in Chadderton); and Bleak Hey Nook, Boarshurst, Delph, Denshaw, Diglea, Dobcross, Grange, Grasscroft, Harrop Green, Hey, Hey Top Greenfield, Holly*

Grove, Landhill Lane, Lees, Lydgate, New Delph, New Tame, Royal George Mills, Scouthead, Saint Chad's Church Saddleworth, Stone Breaks, Tame Water, Uppermill (in Saddleworth and Lees);

iii. *Registered parks and gardens – sites on the historic parks and gardens register in Oldham include Alexandra Park, Chadderton Cemetery and Greenacres Cemetery. Inclusion on the register does not provide any additional statutory protection but represents a material planning consideration in relation to any development within or adjoining the park that may affect its setting. The policy applies to grade I, grade II* and grade II registered parks and gardens;*

iv. *Scheduled ancient monuments – archaeological remains of national importance that have special protection under the Ancient Monuments and Archaeological Areas Act 1979. The consent of the Secretary of State is required for any works that affect a scheduled ancient monument. Scheduled Ancient Monuments in Oldham include Castleshaw Roman Fort, Bowl Barrow near Knarr Barn, Delph and Dee Mill engine and engine house, Shaw;*

v. *Significant archaeological remains – remains that form part of a record of the past that begins with traces of early humans; and*

vi. *Locally significant, non-designated buildings, structures, areas or landscapes of architectural or historic interest – the council will compile a local list of buildings, structures and landscapes that, although non-designated, are of local significance and provide a positive contribution to the borough's historic environment.'*

2.3 Other Guidance

Historic England

2.3.1 Historic England has published a series of Good Practice Advice (GPA) notes and Advice Notes (AN) of which those of most relevance to this appraisal are GPA2 - Managing Significance in Decision-taking (HE 2015), GPA3 - The Setting of Heritage Assets (HE 2017), and AN12, Statements of Heritage Significance (HE 2019).

2.3.2 GPA2, Managing Significance in Decision-taking emphasises the importance of having a knowledge and understanding of the significance of heritage assets likely to be affected by the development and that the 'first step for all applicants is to understand the significance of any affected heritage asset and, if relevant the contribution of its setting to its

significance' (paragraph 4). Early knowledge of this information is also useful to a local planning authority in pre-application engagement with an applicant and ultimately in decision making (paragraph 7).

2.3.3 GPA3, The Setting of Heritage Assets provides advice on the setting of heritage assets. Setting is as defined in the NPPF and comprises the surroundings in which a heritage asset is experienced. Elements of a setting can make positive or negative contributions to the significance of an asset and affect the ways in which it is experienced. Historic England state that setting does not have a boundary and what comprises an asset's setting may change as the asset and its surrounding evolve. Setting can be extensive and particularly in urban areas or extensive landscapes can overlap with other assets. The contribution of setting to the significance of an asset is often expressed by reference to views and the GPA in paragraph 11 identifies those views, such as those that were designed or those that were intended, that contribute to understanding the significance of assets.

2.3.4 In assessing whether the setting of an asset contributes to its significance, and in assessing the effect of development, Historic England GPA3 provides a checklist of attributes that may affect setting and significance under five broad categories comprising:

- The location and siting of the development;
- The form and appearance of the development;
- Additional effects (change to skyline etc.);
- Permanence; and
- Consequential effects.

2.3.5 Other relevant guidance is set out in:

- Historic England Conservation Principles, Policies and Guidance for the Sustainable Management of the Historic Environment (HE 2008);
- Historic England Historic Environment Good Practice Advice in Planning Note 1: conservation area designation, appraisal and management (HE 2016a);
- Historic England Advice Note 7: Local Heritage Listing (HE 2019);
- Historic England Preserving Archaeological Remains Decision-Taking for Sites Under Development (HE 2016b);
- Historic England Understanding Historic Buildings, A Guide to Good Recording Practice (HE 2016c); and,

- Historic England Statements of Heritage Significance (HE 2019).

Chartered Institute for Archaeologists

2.3.6 The baseline study has been undertaken in accordance with guidance published by the Chartered Institute for Archaeologists (CIfA), with specific regard to the Standard and Guidance for Historic Environment Desk-based Assessment (CIfA 2020) and the Code of Conduct (CIfA 2022)

2.4 Consultation with stakeholders

2.4.1 Historic England, Tameside Metropolitan Borough Council (TMBC) and Oldham Metropolitan Borough Council (OMBC) have been involved in ongoing stakeholder consultation with Network Rail throughout the development of the Route Section W2B of the Order Scheme. Regular meetings have been held to discuss design development and potential impacts of the proposals in relation to listed structures along the route. These discussions are detailed in the Heritage Statements [refer to Volume 3, Appendix 5A of this Report [**NR14**]).

2.4.2 Consultation was undertaken with Greater Manchester Archaeological Advisory (GMAAS) Service on 7 October 2024. The following was discussed during the meeting:

- Network Rail presented the Scheme and of Route Section W2B, and the required consents which are being prepared (TWAO, and listed building consents).

- Baseline conditions were presented which included an overview of the online designated heritage assets, offline non-designated heritage, and archaeological potential. Potential impacts were presented along with embedded and additional mitigation measures which are recommended in the DBA. There is a desire to include local community groups in which GMAAS supports the idea.

- GMAAS found the presentation to be helpful and confirmed that they would like to be involved in the project going forward. GMAAS agreed to undertake a review of the Desk Based Assessment.

- GMAAS recommended that the Historic Environment Record (HER) be repurchased given it has expired and additional assets have been included, including Heyrod Old Hall which requires further investigation, and the Oldham Council Local List.

- Other matters discussed as part of the meeting included an overview of previous engagement undertaken with OMBC and TMBC, a discussion around the archaeological process of community engagement, preference for brownfield sites over greenfield sites, an overview of the public benefits and overview of reconstruction of Wright's Overbridge

(MVL3/23).

2.4.3 A meeting was held on the 3rd of April with GMAAS to provide an update on the Order Scheme and assessment of heritage impacts, including discussion of potential impacts on archaeological remains as a result of compound establishment, haul roads, fencing and laydown areas. The early stage of design development for these areas was noted and the intention to mitigate impacts on archaeological remains through design measures where possible, as detailed design of these areas develops. This could potentially include measure such as minimising land-take and ground works, utilising areas subject to previous ground disturbance and sensitive foundation design.

2.4.4 High potential for archaeological remains was noted by Network Rail at Printworks Main Compound, Printworks Office Compound, Scout Tunnel Site Compounds, and Plevins Compound. GMAAS noted that the Railway Goods Warehouse at Plevins is not currently recorded on the HER and presents an opportunity for further documentary research and historic building survey. GMAAS also noted archaeological interest in the compounds around Scout Mill, including the potential for survival of headraces and tailraces associated with Scout Mill, a fulling mill of 18th century date. Further documentary research would be required if these sites were taken forwards.

2.4.5 Moderate archaeological potential was noted by Network Rail at Scout Tunnel Eastern Car Park, Manchester Road Scout West, Mossley Station Compound, Brownhill Lane Compound and Grandpa Greens Site Compound 1 and 2.

2.4.6 GMAAS responded that no significant archaeological concerns had been identified within these areas and highlighted the need to target resources to investigate the most significant archaeological remains.

2.4.7 The Order Scheme was noted by GMAAS to present a substantial opportunity for public engagement with heritage. The potential for engagement around railway history and historic railway infrastructure was highlighted.

3. ASSESSMENT METHODOLOGY

3.1 Study Area

3.1.1 Based on professional judgement and proportionality, a 250 m focused study area extending around the Scheme boundary[1] has been established as being appropriate for identifying relevant designated and non-designated

[1] Including areas subject to Permitted Development as shown on Deposited Plans and Sections, Traffic Regulation Plans and Open Space Plans [**NR9**]

historic environment assets that potentially could be affected by the Order Scheme. This is due to:

- The assessment of the overall significance and character of the Order Scheme in the Route-wide Statement of Significance (Alan Baxter Associates, 2019). This was produced to characterise the heritage significance of the Transpennine route as a whole;
- The archaeological context of the Order Scheme, as understood from HER data;
- The design of temporary construction works including the proposed compound areas, laydown areas and spoil areas for use in the construction of the Route Section W2B[2]; and
- The wider landscape is also considered, to provide an archaeological and historical context for the Order Scheme.

3.1.2 Within the study area, designated and non-designated heritage assets are categorised as either online of offline assets. Online assets refers to those which are located directly on and associated with the railway line, and offline assets are those which are within the study area but not on the track alignment.

3.1.3 The study area also takes into consideration the existing use of the working railway corridor and the influence it already has on its surroundings. This includes consideration of how the railway contributes to the setting of the heritage assets and where assets are intrinsically linked to the railway that forms part of their significance.

3.1.4 All historic assets identified within the study area are listed in gazetteers (Annex A). The locations of designated assets, non-designated assets, historic landscape character assessment and archaeological investigations are shown on the figures included Volume 2 of the TWAO environmental report. Only the more relevant heritage assets are discussed within the baseline, where they contribute to key themes in understanding the character and value of the railway and area.

3.2 Sources of Information

3.2.1 Data sources consulted, collected and assessed for this desk based assessment include the following:

- National Heritage List for England (NHLE))[3] information on designated sites: World Heritage Sites, scheduled monuments, listed buildings,

[2] The proposed compound locations are considered in Section 5 and in Annex B.

[3] National Heritage List for England (NHLE) https://historicengland.org.uk/listing/the-list

registered parks and gardens and historic battlefields, accessed 09 November 2024;

- Information on non-designated assets, including locally listed buildings and structures of local heritage interest gathered by a search of:
    - GMAAS Historic Environment Record (GMHER)[4], accessed 11 November 2024;
    - GMAAS Greater Manchester Historic Landscape Characterisation survey data, accessed 11 November 2024;
- Oldham Metropolitan Borough Council[5] and Tameside Metropolitan Borough Council Conservation Areas[6], accessed 09 November 24;
- Historic England Heritage at Risk Register[7], accessed 20 January 2025;
- British Geological Survey (BGS)[8] online, accessed 15 February 2024;
- Historic Ordnance Survey (OS) mapping held by the National Library of Scotland[9], accessed 04 March 2024;
- Photographs viewed online via the National Collection of Aerial Photography[10] and Google Earth[11], accessed 04 March 2024;
- Archaeology Data Service[12], for information on previous cultural heritage assessments and fieldwork surveys, accessed 19 February 2024; and
- Tameside Local Studies and Archives Centre[13], for additional cartographic and historical sources, visited 05 November 2024.

3.2.2 Preparation of the report has also been informed by the walk over surveys undertaken for the Order Scheme in 2024 and 2025, leading to the

[13] Tameside Local Studies and Archives Centre https://www.tameside.gov.uk/localstudies/

identification of a small number of additional heritage assets which are prefaced with *AR* in the following report.

3.2.3 This report also draws upon information previously prepared for the Route Section W2B on behalf of Network Rail. This includes a number of reports prepared by Alan Baxter and Associates Ltd, namely the '*Transpennine Route Statement of History and Significance: West of Leeds'* (Alan Baxter Associates 2024) and the '*Transpennine Route Upgrade Route-Wide Statement of Significance*' (Alan Baxter Associates 2019). Other documents consulted include the 'Transpennine Route Upgrade W2B Heritage Assessment Report' (Network Rail 2021) and Heritage Statements prepared as part of the current Scheme. These are presented in Volume 3, Appendix 5A of this Report [**NR14**].

3.3 Assessment of Significance

3.3.1 An assessment of the significance of assets and their setting has been undertaken in consideration of guidance and good practice issued by Historic England. Historic England GPA3 provides the basis of a methodology for the assessment of setting.

3.3.2 The NPPF defines significance as *'the value of a heritage asset to this and future generations because of its heritage interest. That interest may be archaeological, architectural, artistic or historic. Significance derives not only from a heritage asset's physical presence, but also from its setting'.* The NPPF also identifies that significance can be derived from the asset itself, its physical presence, and from its setting.

3.3.3 The significance of heritage assets has been determined based on professional judgement guided by designations, national and local policies, guidance documents and research frameworks.

3.3.4 The terminology used in this statement relates to the terminology used by NPPF, and AN12 (Historic England 2019), referring to significance in terms of heritage interest and not heritage values.

3.3.5 The assessment of significance of heritage assets has been informed by the Design Manual for Roads and Bridges (DMRB) LA104 environment value methodology (DMRB 2020). Professional judgement has been applied in developing Table 3-1 below, against the criteria defined in LA104. The heritage examples of these categories and the unknown significance category have been established by professional knowledge and experience. Assessment of the significance of heritage assets presented in this report has been undertaken using professional judgement guided by the criteria set out in Table 3-1 below:

Table 3-1 Assessment of heritage significance

Significance	Description	Heritage example
Very High	Very high importance and rarity, international scale, with very limited potential for substitution.	World Heritage Sites, or heritage assets recognised as being of international importance.
High	High importance and rarity, national scale and limited potential for substitution.	Grade I and II* listed buildings, grade I and II* registered parks and gardens, scheduled monuments, protected wreck sites, registered historic battlefields, conservation areas with notable concentrations of heritage assets, Grade II listed buildings of exceptional interest, and undesignated assets of national importance and/or rarity. Historic landscapes of national importance and/or rarity.
Medium	Medium or high importance and rarity, national or regional scale, limited potential for substitution	Grade II listed buildings, grade II registered parks and gardens, conservation areas and undesignated assets of national or regional importance. Historic landscapes of national or regional importance.
Low	Low or medium importance and rarity, local scale.	Locally listed buildings and undesignated heritage assets of local importance. Historic landscapes of local importance. Can also include degraded designated assets that no longer warrant designation.
Negligible	Very low importance and rarity, local scale.	Undesignated heritage assets of very low or limited importance. Can also include highly degraded designated assets that no longer warrant designation.
Unknown	The importance of the asset has not been ascertained. This could include, or be related to: Potential archaeological sites for which there is little information Assets for which the importance of the site cannot be determined based on current knowledge Isolated findspots, place names or cropmarks identified on aerial photographs with no known information at present. Heritage assets of unknown significance may include sites of potential national significance.	

3.4 Setting of Heritage Assets

3.4.1 The setting of heritage assets has been considered, in accordance with Historic England's The Setting of Heritage Assets: Historic Environment Good Practice Advice in Planning Note 3 (Historic England 2017). This Historic Environment Assessment principally considers archaeological remains which pre-date the railway and associated features. Setting can contribute to the significance of archaeological assets, including buried remains.

3.5 Archaeological potential

3.5.1 Archaeological potential assesses the potential that unrecorded archaeological remains may exist within the Order Scheme boundary in addition to the known archaeological resource identified in the baseline. The potential for unrecorded archaeological remains to exist within the Order Scheme boundary has been determined by professional judgement guided by an assessment of the existing cultural heritage resource and the impact of previous modern development or ground disturbance within the Order Scheme footprint. Assessment of the archaeological resources draws on three factors:

- An assessment of the potential for the survival of archaeological deposits within the Order Scheme boundary based on an evaluation of previous ground disturbance;
- An assessment for the potential for archaeological deposits to exist within the Order Scheme boundary based on the results of the baseline study; and
- An assessment of the significance of known and potential archaeological assets within the Order Scheme boundary, as well as within the defined study area.

3.5.2 The level of disturbance to buried archaeological remains caused by historic development has been assessed based on available data listed at section 3.2.

3.5.3 The potential for an area to contain archaeological remains is rated ‘high’, ‘medium’, ‘low’, ‘negligible’, or ‘unknown’. This rating is based on an understanding of the archaeological resource as a whole and takes into account the Order Scheme’s geological and topographical setting. The rating also considers the number and proximity of known and predicted archaeological/historical sites or find spots within the Order Scheme footprint and the surrounding study area.

3.6 Previous Ground Disturbance

3.6.1 Previous ground disturbance varies across the assessment area, reflecting a range of past activities and has been considered as part of this assessment.

3.6.2 In some areas, railway cuttings, landscaping and deep excavations have cut into the natural geology, resulting in the complete removal of any subsurface archaeological deposits. Elsewhere, extensive construction works, such as deep foundations, quarrying, or the installation of large utilities, have caused significant disruption, leaving only the deepest archaeological features, like wells or quarry pits, potentially intact.

3.6.3 Moderate levels of disturbance is likely in zones affected by structural foundations, construction layers, and utility trenches. In these areas, while some impact has occurred, there remains a possibility that archaeological remains survive either between or beneath the existing development footprint.

3.6.4 In contrast, certain parts of the site have experienced only shallow interventions, such as ground surfacing or the creation of car parks. These activities may have caused limited truncation, but any archaeological deposits are likely to remain preserved beneath the disturbed surface.

3.6.5 Finally, there are areas with no known historic development impacts. These zones offer the highest potential for the survival of intact archaeological horizons, spanning periods from prehistory through to the post-medieval era.

3.7 Walkover Survey

3.7.1 A number of site visits have been undertaken as part of the assessment for Route Section W2B. The full list of site visit including the assets visited and description of survey undertaken is provided in Appendix D.

3.7.2 An archaeological walkover survey was undertaken on 27/08/24 and on 03/10/24, the latter following changes to the Order Scheme boundary. The site visit targeted, parcels of land where there was considered to be potential for unknown buried remains to be impacted. Areas visited on the site walkover included Printworks Compounds and Office Compound, land-take next to Ward Lane Overbridge (MVL3/36), land-take at Oldham Road Overbridge (MVL3/28) for a temporary compound, land-take at Greenfield Lane for Wright's Overbridge (MVL3/23), Hobbe Hole Underbridge (MVL3/22) and the land between the bridges, Heyrod Hall Overbridge (MVL3/7), and land-take for Wright's Mill Overbridge (MVL3/20).

Insert 3-1 Photograph from walkover survey of Stockport Road towards Midge Hall Underbridge MVL3/19 and area of land-take for Wright's Mill Overbridge MVL3/20

3.7.3 Following the identification of development compound locations, a site visit was undertaken on March 21 and 24 2025 to assess the compound locations at Printworks, Scout Tunnel, Manchester Road, Heron Lane, Brown Hill, Grandpa Green's and Butterhouse. Subsequently, the finalisation of the compound list prompted another site visit on 13 June 2025 to undertake external assessment of a former railway goods warehouse on Plevins Compound.

3.7.4 Site visits were also undertaken for built heritage along the Order Scheme on 21-22 May 2024, 1 July 2024 and 28 August 2024. Designated online assets, and those assets which warrant consideration due to potential for impact on setting given their proximity to Scheme were visited to assess the potential for impact from the Order Scheme.

3.8 Assumptions and Limitations

3.8.1 The historic environment assessment takes into account a number of assumptions and limitations. These have arisen from the extent of the Order Scheme design, including construction design, knowledge and understanding of the historic environment and responses from stakeholders.

3.8.2 Detailed assessments of Scheme impacts on the fabric and setting of listed railway structures are detailed in a series of Heritage Statements presented in Volume 3, Appendix 5A of this Report [**NR14**]. This report does not seek

to replicate the content of these reports, but focuses on the wider historic environment, and particularly buried archaeological remains.

Assumptions

3.8.3 The understanding of extent, survival and significance of non-designated heritage assets (both identified on the HER and from historic maps) has been based on available information and professional judgment.

3.8.4 Broad historic landscape types have been taken from the Greater Manchester Historic Landscape Characterisation and have considered their current use and how this reflects historic character. The significance of each broad historic landscape type within each route section has been based on professional judgment.

Limitations

3.8.5 The HER data and information contained therein relating to each non-designated heritage asset is reliant on GMHER for its accuracy. The assessment has relied upon data and records provided by third parties, and therefore it has been assumed that this information is accurate and up to date at the time of reporting.

3.8.6 The assessment has been undertaken using the available design for the Order Scheme and the maximum likely extents of land required for its construction, operation and maintenance.

3.8.7 Whilst the locations for compounds have been determined at this time, the proposed layout and methodology for their establishment has not been developed at this stage. As such, the assessment of impact has used the precautionary principle and assumed maximum impact to heritage assets including ground disturbance and demolition of existing structures.

3.8.8 No archaeological evaluations have yet been undertaken to inform this historic environment assessment. Assessment of archaeological potential has been based on desk-based assessment at this time.

4. BASELINE

4.1 Overview

4.1.1 This Section describes the baseline historic environment conditions within the study area and its environs. These form the baseline upon which Scheme impacts are assessed within this document and going forwards.

4.2 Previous Investigations in the Study Area

4.2.1 There has been a moderate amount of historical and archaeological investigation across the study area of the Order Scheme. These have

primarily been site walkover survey and built heritage studies although there have also been desk-based assessments and archaeological excavations.

4.2.2 A focus of prior investigation has been around Pule Hill and Warcock Hill, c.3km northeast of the southern portal of the Standedge Tunnel at Diggle, where large concentrations of lithic scatters have been recorded, identified through systematic field walking, chance finds and excavations. These concentrations have been investigated by P.R. Preston who considered the range of lithic scatters indicated a 'persistent place', an area repeatedly visited by Mesolithic hunter-gatherer groups and often for a short duration for a range of different tasks (Preston 2013).

4.2.3 Castleshaw Roman fort (NHLE 1017837) scheduled monument is located outside the study area, however is considered here due to its significance in the wider landscape. It is located c. 1.6km northwest of the southern portal of the Standedge Tunnel. It has been subject to repeated archaeological investigation to determine the date and nature of the internal buildings of the fort and fortlet, as well as the sequence of construction and abandonment. Excavations were published in 1908 and 1911 and later more fully interpreted by I. A. Richmond in 1925 (Richmond 1926). Further investigations from 1957 to 1964 defined the position and function of many interior buildings. The fort and fortlet were extensively re-excavated from 1984 to 1988, with a programme of restoration completed in 1989. Further exploration of areas outside the forts was carried out during 1995 and 1996. The investigations have removed localised areas of archaeological remains within the Scheduled Monument but much of the settlement has been left undisturbed.

4.2.4 There have been surveys and investigations of several post-medieval mills within the study area. Knoll Mill (EGM4470), which was subject to an archaeological watching brief and strip, map and sample recording, and Castle Street Mills (EGM4823, EGM5165), had trial trenching undertaken prior to redevelopment.

4.3 Site Conditions

Geology

4.3.1 The region between Stalybridge and Greenfield is part of the Pennine Basin which is characterised by sedimentary rocks formed in the Carboniferous period, 298–358 million years ago. The bedrock geology between Stalybridge and Mossley comprises bands of sedimentary formations including Pennine Lower Coal Measures Formation, Rough Rock Sandstone, Rossendale Formation (Mudstone and Sandstone), Fletcher Bank Grit (Sandstone), Marsden Formation - Mudstone and siltstone. North of Mossley the Order Scheme passes through areas of Upper Kinderscout Grit (Sandstone), Hebden Formation - Mudstone and siltstone and Lower Kinderscout Grit - Sandstone. At Diggle and entering the Standedge

Tunnel, the Order Scheme passes through Shale Grit – Sandstone (BGS 2024).

4.3.2 The superficial deposits encompass a variety of glacial and post-glacial formations formed in the Quaternary period. It comprises glaciofluvial sheet deposits, characterised by well-sorted sands and gravel, as well as alluvium, clay and sand/gravel along the course of the River Tame and the Diggle Brook (BGS 2024).

Soils

4.3.3 The soils between Stalybridge and Greenfield exhibit a diverse range, from slowly permeable seasonally wet soils to freely draining soils. They are observed to be acidic in nature with texture being loamy and clayey. This also results in the region having low fertility making it suitable for selective few crops along with lower yield in some areas (stony and shallow areas). Some very acid loamy upland soils with a wet peaty surface are present, particularly on the moors from Dobcross northwards to the A63 north of Diggle, and around Heyrod. There are also large areas of unclassified soils, often in previously industrial or urban areas (Cranfield University 2024).

Topography

4.3.4 The railway broadly follows the contours of an east-facing hillside between Stalybridge and Heyrod. Stalybridge Station lies at c. 116 m AOD, and the track rises towards Heyrod, which is at c. 130 m AOD. From Heyrod to Mossley, the route is cut into the hillside and in tunnel. Mossley Station lies at c. 150 m AOD, and the railway is in cutting; several bridges span the cutting, linking Mossley's streets above and then passes through the south-east of Grasscroft. Greenfield Station and Uppermill lie at c. 180 m AOD.

4.3.5 Land rises to the west and east of the route, towards hills forming part of Saddleworth Moor. North-west of Heyrod, land rises to c. 247m AOD at Luzley End Farm. West of Mossley, land rises steeply to c.308 m AOD. Wharmton (348 m AOD), rises to the west of Greenfield Station. The brow of Harrop Edge overlooks Diggle, rising to c. 348 m AOD.

4.3.6 To the east of the route is the Peak District and Saddleworth Moor. Key summits include Alphin Pike east of Mossley (469 m AOD) and Broadstone Hill, east of Diggle (454 m AOD). Some areas of the Order Scheme offer sweeping views across the Tame Valley towards the high mosses to the east. Local landmarks include the obelisk (Saddleworth War Memorial, Grade II, NHLE 1163991) at the top of Dick Hill, east of Uppermill and Greenfield.

4.3.7 For the southern extent of Scheme, from Stalybridge to Dobcross, the River Tame and the Huddersfield Narrow Canal lie to the east of the Order Scheme. Uppermill Viaduct (MVL3/31) crosses both watercourses just to the east of Dobcross where the River Tame heads west towards Delph and

onwards to its source at Denshaw. The Huddersfield Narrow Canal then remains to the west of the route up to Diggle where the railway continues alongside the canal and though the Standedge Tunnels.

4.3.8 There are numerous springs in the hills that feed minor watercourses; some of these are tributaries of the Tame, and others have been diverted to feed mills in the valley. The north of the route crosses the Diggle Brook, a tributary of the Tame.

4.3.9 The A670 broadly follows the Tame Valley, running parallel to the railway between Stalybridge and Mossley, and north of Greenfield Station. the Order Scheme is crossed by numerous minor roads, often carried over railway cuttings via historic bridges. There are many footpaths including the Tame Valley Way, the Tameside Trail, the Pennine Bridleway and the Standedge Trail, which link to the long-distance Pennine Way.

4.4 Historic Environment Baseline

Palaeolithic – c. 14,000 to 10,000 BC

4.4.1 The earliest human occupation of Britain dates to c. 900,000 years ago. Finds from East Anglia such as animal bone and flint tools suggest that humans would have been present alongside animals such as mammoths. There are very few known deposits that might contain evidence of early human occupation in the Lower or Middle Palaeolithic periods. There is evidence for human activity in the region in the Upper Palaeolithic period, in the form of lithic scatters recovered from fieldwalking (surface artefact collection) in upland peat environments and from excavations in caves and rock shelters (NWRRF 2020).

4.4.2 The Late Upper Palaeolithic (c. 11,000 to 8000 BC) represents the final stages of the Devensian glaciation. The archaeological evidence is sparse but certainly demonstrates the presence of human groups in the region during this time. As the ice retreated and the climate became warmer in the Late Devensian interstadial period, the vegetation on the drier land developed and was ultimately replaced by more open grassland. Environmental changes resulted in a general rise in sea-level as the ice cap melted, an increase in rainfall.

4.4.3 On the eastern periphery of the Order Scheme, particularly around Pule Hill and Warcock Hill, c.3km northeast of the southern portal of the Standedge Tunnel at Diggle, several flint scatters have been recorded via fieldwalking. The HER data has attributed some elements of these clusters to the Lower Palaeolithic period, however, the dating of these is unconfirmed.

4.4.4 There are no Palaeolithic finds within the 250 m study area around the Order Scheme.

Mesolithic – c. 10,000 to 4,000 BC

4.4.5 The post-glacial reoccupation of the Pennines occurred after c. 8,000 BC as remnant patches of snow and ice melted.

4.4.6 The main evidence for Mesolithic activity across the region comprises scatters of lithic material characterised by the distinctive microlithic flint tools and tool-making debris, picks and axe-heads of mobile hunter-gatherers. The distribution of Mesolithic findspots includes coastal areas, river corridors and areas that are now upland moorland. The Mesolithic finds of the central Pennines uplands can be considered to be of national importance (GMAU 2012).

4.4.7 Extensive upland scatters have been recorded between Saddleworth and Marsden east and north of the Order Scheme, with slopes between 366 and 457 m AOD being favoured localities overlooking spring head' (Barnes 1982, Spikins 1999). Excavations of upland sites have identified hearths and stake-holes near areas of chipped stone tool-making debris, perhaps indicating campsites (Hodgson & Brennand 2007). Swineshaw Moor, located c. 2.5 km east of Stalybridge, has yielded numerous Late Mesolithic finds and features, including evidence of re-cutting and re-use of hearth pits (NWRRF 2020).

4.4.8 To the north-east of the study area, 41 findspots or scatters of struck stone tools and tool-making debris have been recorded as dating from the Mesolithic period. The area around Pule Hill has been defined by P.R. Preston in his thesis as a 'persistent place', a cluster of sites which were repeatedly visited by Mesolithic hunter-gatherer groups (Preston 2013) and of national archaeological importance given the density of significant Mesolithic artefacts. the Order Scheme intersects the north-western extent of this 'persistent place'. The Central Pennines have been subject to extensive flint collecting since the 19th century, with this area subject to collection in the 1920s and 1930s by Francis Buckley (Buckley 1921, Buckley 1924) and by Pat Stonehouse from 1967–1997 (Stonehouse 2001). The large collections of flint that have resulted from these activities may over-emphasise the importance of this location relative to other areas. It is likely that railway construction will have removed any deposits in the vicinity of the Order Scheme.

4.4.9 Five Mesolithic assets are recorded north-west of the Order Scheme: four lithic findspots and a crescent-shaped microlith. A Mesolithic flint workshop (1089.1.0) is also recorded approximately 745 m north-west of the study area.

Neolithic – 4,000 to 2,200 BC

4.4.10 The Neolithic period marked a transition from hunter-gatherer lifestyle to more settled cultivation and livestock farming, with some seasonal migration. In the Greater Manchester area, the archaeological evidence indicates the establishment of farming communities, the construction of burial mounds and megalithic structures.

4.4.11 Several assets dating to the Neolithic period have been recorded in the vicinity of the Order Scheme. A small grey stone hammer (5903.1.0) was discovered by a member of the public near Uppermill Station, in gravel along the River Tame c. 190 m east of the Order Scheme. Similarly, another grey stone hammer (479.1.0) which was found during the excavation of a well was recorded within the boundary of the Order Scheme, and a pebble hammer (or possible weight or spindle whorl) (487.1.0) was discovered below the surface of Stalybridge Station, *c*.40 m west of the study area.

Bronze Age – 2,600 to 700 BC

4.4.12 The Bronze Age represents a period marked by significant changes in technology, trade and societal organization. Metallurgy developed with the use of copper and copper alloys for making weapons, tools and personal ornaments. During this period woodland clearance accelerated, allowing more extensive cultivation on lower ground, along valleys and along the woodland edges. Cattle pasturing on the uplands was more extensive. In the Bronze Age, the seasonal migration patterns of the Neolithic changed; hut circles and field systems developed. By the later Bronze Age, enclosed settlements and fortified settlements were being constructed.

4.4.13 A Scheduled Bronze Age cairn, round cairn west of Hollingworthhall Moor (NHLE 1011682), is located to the east of Stalybridge, c. 2.3 km from the Order Scheme. Despite some minor mutilation of the monument's top and southern side by the erection of an Ordnance Survey column and a drystone wall, the round cairn west of Hollingworthhall Moor survives reasonably well, with the mound of stones up to 0.8 m high with maximum dimensions of c. 19 m by 18 m. It is located on the elevated ground of Wild Bank Hill.

4.4.14 A possible barrow (1096.1.0) is recorded on Brown Hill, approximately 30m east of the Order Scheme boundary. It was dug by quarrymen in 1844 and its contents were mostly destroyed. Two urns (found at a depth of 4ft 6" [1.37 m] from the top the barrow) and a broken perforated celt were uncovered at the site. There is no trace of a barrow in the vicinity of Brown Hill now.

4.4.15 The previously mentioned lithics clusters to the east of the Order Scheme around Pule Hill also contain concentrations of Bronze Age lithics. Although the focus of activity in this location appears to have been during the Mesolithic period, the area was evidently also in use during the Bronze Age.

Iron Age – c. 800 BC to AD 43

4.4.16 The Iron Age witnessed further transformation in material culture, settlement arrangements and societal frameworks. The period marked a gradual shift from the usage of bronze tools and weapons to their iron

counterparts, resulting in technological changes in agriculture, construction and craft production.

4.4.17 Increase in land enclosure, for fields, livestock and settlement, indicates the growing importance of agriculture and securing sustenance. Historical evidence suggests that hillforts were strategically situated in the landscape serving as defensive positions and vantage points that could survey territories and also as constructions tied to local identity and resilience.

4.4.18 There is very limited evidence of Iron Age activity recorded within the vicinity of the Order Scheme. A smithing hearth (8241.1.0) is noted approximately 1.8 km to the east of the Order Scheme, immediately north of Walkerwood Reservoir. It was 0.75 m wide and 0.15 m deep, lined with slag and filled with a mixture of charcoal and slag. It was believed to be of Iron Age or Roman origin. Two carved stones in the shape of a head were recorded at 146 Carr Lane (9017.1.0), 90m west of the Order Scheme. They are now missing and there is no 146 on Carr Lane.

Roman – AD 43 to 410

4.4.19 The conquest by Emperor Claudius bought significant changes to the landscape, culture and governance of the region. Fortifications and roads were established. There is a fort at Castleshaw (*Rigodunum*), c. 1.6 km north-west of the Order Scheme's northern extent at the Standedge Tunnel. A sequence of Roman forts were located in strategic positions on high ground overlooking the Castleshaw Valley and the Roman road from Chester to York, defending and patrolling the road in this area as it approached the western Pennines.

4.4.20 North of Standedge, the Standedge Tunnel lies south of the route of the Roman road that connected Manchester to Castleshaw, part of the wider Roman road from Chester (Deva) to York (Eboracum) (Margary Road 712). At Standedge Ridge, despite considerable erosion, the road can be seen to have been more than 6.7 m wide. It has been investigated elsewhere along its route, with remains of a cambered, rough gritstone surface being recorded.

4.4.21 Castleshaw Roman forts (NHLE 1017837) are located approximately 1.6 km to the west of the Order Scheme. This Scheduled Monument includes a sequence of Roman forts, together with the remains of a settlement outside the ramparts of the forts and a section of the aforementioned Roman road leading to the forts from the south-west. The earliest fort on the site dates to AD 79 and the settlement appears to have been abandoned in AD 125. The site has been extensively excavated over the last 100 years. A civilian settlement developed outside the fort.

4.4.22 There is no other evidence of Roman activity recorded within the study area.

Early Medieval – 410 to 1066

4.4.23 The early medieval period in the region was characterised by significant socio-political changes following the withdrawal of Roman governance, which the region may have fragmented into a number of small kingdoms. During the 7th century these smaller kingdoms were subsumed within the Kingdom of Northumbria. With waning political power and influence from the later 8th century onwards, the region appears to have remained politically unstable until the Norman Conquest. Scandinavian and Hiberno-Norse incursions and evidence of associated settlements have been noted. There is no recorded evidence of early medieval activity within the study area for the Order Scheme, however places such as Rochdale and Oldham bear names with Old Norse origin, attesting to the Norse influence in the area.

Medieval – 1066 to 1540

4.4.24 There is limited evidence of medieval presence in the vicinity of the Order Scheme.

4.4.25 A Scheduled Monument, Buckton Castle (NHLE 1015131), is located approximately 1.6 km east of the Order Scheme near Mossley. The site has previously been interpreted as a Romano-British earthwork fort and a late Iron Age promontory fort but it is now believed, based on a more detailed survey in 1991, to date to the medieval period. The monument includes a ringwork castle and the remains of a bailey on the northern side; located on elevated land on Buckton Moor, it commands a view over the River Tame, the Carr Brook and the surrounding landscape.

4.4.26 The HER records two medieval assets within the study area of the Order Scheme. Located adjacent to the Heyrod Hall temporary compound, Heyrod Hall (751.1.0) was owned around 1422 by John del Heyrod. Rent was paid to Sir John de Assheton, later passing to the Duckenfield family. The hall was rebuilt or moved by RW in 1638.Two carved stones in the shape of a head (9003.1.0), one female and one male, were recorded c.145m east from the Order Scheme, near Churchill Playing Fields, although they may be confused with another set of carved heads (9003.1.1) which date from the Victorian period and found near the same location.

4.4.27 Some seven settlements have been recorded within the study area. Approximately 100 m north-west of the Order Scheme is Shaw Hall Settlement (6255.1.0), a medieval historic core recorded on historic

mapping. These buildings are no longer extant but place names, including 'Shaw' meaning 'wood', attest to the early medieval and medieval presence in this area. Further evidence of medieval settlement has been recorded in Stalybridge (3583.1.0), where historic mapping identified development along the River Tame. The first record of the place name, Stauelegh, is attested in a 13th century document and means *'clearing where the staves are'* (Mills 2011).

Post-medieval – 1540 to 1901

4.4.28 There is significant evidence of post-medieval activity within the study area with a recorded 228 non-designated offline and online assets.

4.4.29 There are 135 listed buildings within the study area dated to the medieval period, of which 14 assets are located within the Order Scheme boundary. There are eight conservation areas within the study area, two of which fall within the Order Scheme boundary (Uppermill Conservation Area, and Stalybridge Town Centre Conservation Area).There are no scheduled monuments or registered parks and gardens within the study area.

4.4.30 The post medieval period was shaped by improvements in technology, including water-power, and in infrastructure, the development of railways and canals, which enabled the rapid development of industrial activity leading to urbanisation of the labour force and the construction of extensive housing that can be seen across the study area.

Historic Settlements along Route Section W2B

4.4.31 The Transpennine route follows the alignment of the former Huddersfield & Manchester Railway which passes through a series of small towns, the majority of which gained prominence during the Industrial Revolution and the industrialisation of textile production from the late 17th to 19th centuries. The arrival of the railway and some stations in the mid-19th century helped to further grow and expand the industry through improving the mobility of people and goods including coal, slate and timber, which contributed towards the expansion of these towns (Barrow *et al.*, 2023).

4.4.32 Within the Saddleworth region, cloth output increased from 8640 coarse cloths in 1740 to 36,639 in 1791 and the textiles produced here were renowned for their quality (Barrow *et al.* 2023, p.1). During the Great Exhibition of 1851 in London, the Saddleworth area was acknowledged for its '*remarkable … manufacture of Saxony Flannels especially those of very fine make which have been very much admired in London and other markets'* (Barrow *et al.*, 2023, p.2). The following section presents a brief background history of each settlement, to provide contextual narrative for the wider route.

Stalybridge

4.4.33 Stalybridge is located on the western extent of the Order Scheme within the River Tame valley. The Staveleigh family occupied Staley Hall during the reign of Edward III (UK Genealogy Archives n.d.). The origins of the contemporary town lie primarily in its post medieval contribution to the textile industry expanding throughout the region. The manufacture of cloth in Stalybridge started in the 16th century and would have been undertaken domestically before the opening of the first cotton mill in 1776 and the first steam engine in 1795 (UK Genealogy Archives n.d.). By 1814 there were a reported 12 mills which expanded to 33 by 1844 (UK Genealogy Archives n.d.).

4.4.34 The arrival of the railway in Stalybridge improved its connectivity and fostered further economic and developmental growth. The area accommodated the intersection of three railway lines; Manchester, Sheffield and Lincolnshire; Manchester and Leeds; and the Huddersfield & Manchester Railway (UK Genealogy Archives n.d.). Along with the Huddersfield Canal and improved road network. These important communication routes together with its proximity to Manchester, enabled Stalybridge to continue to grow and expand throughout the 20th and 21st century into the town that is recognised today.

Millbrook

4.4.35 Millbrook is located to the north of Stalybridge on the south-western extent of the Pennine landscape. On the six-inch OS Map of 1848, the western extent of the settlement was labelled as ‘Millbrook Ward’ and would have encompassed the hamlet of Heyrod. At this time, the area was not characterised by industrial activity but the presence of detached buildings, cottages and halls, albeit the Hartshead Print Works was established further to the south. In the six-inch OS Map 1848 (Insert 4-1), the settlement is shown to have developed to the east of the Huddersfield Canal and the railway corridor with some mills, religious institutions and residential development and the former ‘Millbrook Ward’ is no longer annotated. At this time, there is a station named after the village, known as the ‘Staley & Millbrook Station’ which accommodated the Stalybridge & Diggle Loop Line of the LNWR.

Insert 4-1 Ordnance Survey 1:10,560 County Series Map of 1848 showing Millbrook Ward (left) 1:10,560 County Series Map 1918, Millbrook is shown to the east (right)

4.4.36 In the early 20th century, the area underwent considerable growth, particularly to the south blurring the boundary between Millbrook and Stalybridge. Both the railway and station associated with the Stalybridge & Diggle Loop Line are no longer extant, and the industrial structures have been removed.

Mossley

4.4.37 Mossley derives its placename from its wooded environment ('moss') and relationship with the River Tame ('lea') (Mills 1976, p.113). A known prehistoric route, which was reused and paved during the Roman period passes through the village (Mossley Heritage 2019) and likely connected the forts at Melandra and Castleshaw (Curry 2015). Mossley was first recorded in 1309 whilst under the ownership of William de Mossley (Mossley Heritage 2019). Despite its early medieval origins, Mossley as it is known today, is the result of the post-medieval industrialisation of the woollen and cloth industry and transportation improvements.

4.4.38 Woollen production was initially undertaken domestically in weaver's cottages owned by wealthier farmers (Holt 1974, p.49). The industrialisation of textiles enabled numerous mills to be established, predominantly along the valley bottom (Curry 2015). Andrew Mill was the first to be built in 1765, and by 1830 there were some 20 mills in Mossley (Holt 1974, p.50). John and George Mayall were prolific industrialists from Mossley who acquired and established numerous mills and became important employers in the town (Holt 1974, p.52-53).

4.4.39 The growing textile industry in conjunction with the improvement in road, canal and railway transportation resulted in a phase of expansion between 1750 and 1850 (Holt 1974, p.49). Mossley developed using locally quarried stone which is a key aspect of the character of the area, similar to other villages in the Pennines (Curry 2015). The establishment of the railway

through the village and the opening of a station here were contributing factors towards the growth of the town. The 25-inch OS Map from 1894 (not reproduced here) illustrates a dense concentration of mills and terrace rows near the river and canal, whilst the main town centre developed further to the north. Throughout the 20th century, development continued to expand and supersede the former open landscape creating a more suburban and developed town.

4.4.40 A small industrial neighbourhood to the north of Mossley known as Roughtown also developed out of the industrial prosperity of the textile industry. Mills including Carr Hill and Wood End Mill were established along the river and canal embankment to the east of the neighbourhood centre along with early 18th century houses and cottages (Barrow *et al.* 2023, p.106). Though the railway helped to improve the woollen market in this area, it also resulted in the removal of nine cottages and a dozen cottage gardens (Holt 1974, p.61).

4.4.41 The regional decline in the textile industry from the late 19th century onwards resulted in the closure of various mills throughout the 20th century. Some have remained upstanding and contribute to the historic character and industrial heritage of Mossley, however a number have been demolished.

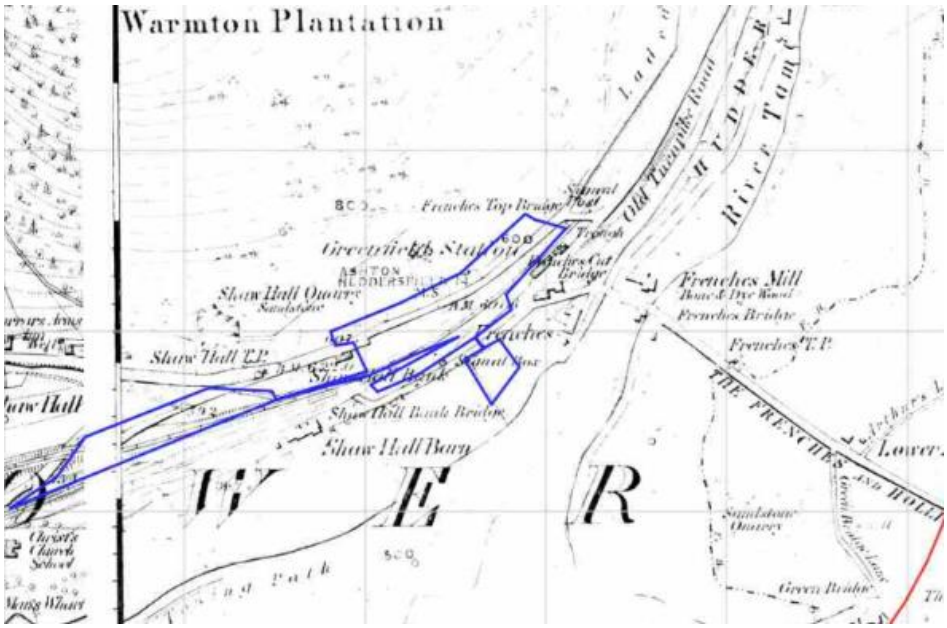
Greenfield

4.4.42 Greenfield is a small village located to the west of Oldham within the banks of the River Tame valley and the Pennine landscape. A Roman road from Castleshaw Fort passed through the area, however Greenfield only developed in the post-medieval period. The Standedge to Oldham Turnpike (now Chew Valley Road) was established in 1799, but the demand for better connectivity by local millowners instigated the establishment of the Shepley Lane Head Turnpike in 1824 (Barrow *et al.* 2023, p.113).

4.4.43 Despite the relatively late arrival of the turnpike roads, the growing demand for loom weavers and industrialisation resulted in the 18th and 19th century development of the village. Terraced houses were built between 1820-60 near mills to house the influx of workers (Belmore 2021). Wellington Mills were landmark structures in Greenfield which was owned by James Shaw (Barrow *et al.* 2023, p.110). By 1885, there were a recorded 85,000 spindles and by 1920 this had increased to 92,000 (Barrow *et al.* 2023, p.110). The mill was devastated by a fire in 1955 and was no longer in use as a mill although the structure remains upstanding (Barrow *et al.* 2023, p.118).

4.4.44 Improvement in transportation included the establishment of the turnpike roads, canal and railway. The opening of Greenfield Station and associated goods warehouse bolstered economic development through increased access to the area (Barrow *et al.* 2023, p.110). These transport networks are depicted in the six-inch OS map 1854 Insert 4-2at which time the area

is predominantly rural with some scattered development flanking the main turnpiked roadways including French Mill and buildings named ‘Shaw’.



Insert 4-2 Ordnance Survey 1:10,560 County Series Map of 1854

4.4.45 Development continued along the turnpike through the late 19th century to the mid-20th century. The turnpike, renamed Chew Valley Road, is the main axis through the town along which development branches to the north and south.

4.4.46 The decline of the textile industry in the 20th century resulted in the subsequent suburban growth of Greenfield. The closure of the textile industry resulted in the repurposing of Greenfield Woollen Mill into a paper mill before its closure in 2001 and demolition of Knoll Mill for a new Tesco Store (Belmore 2021).

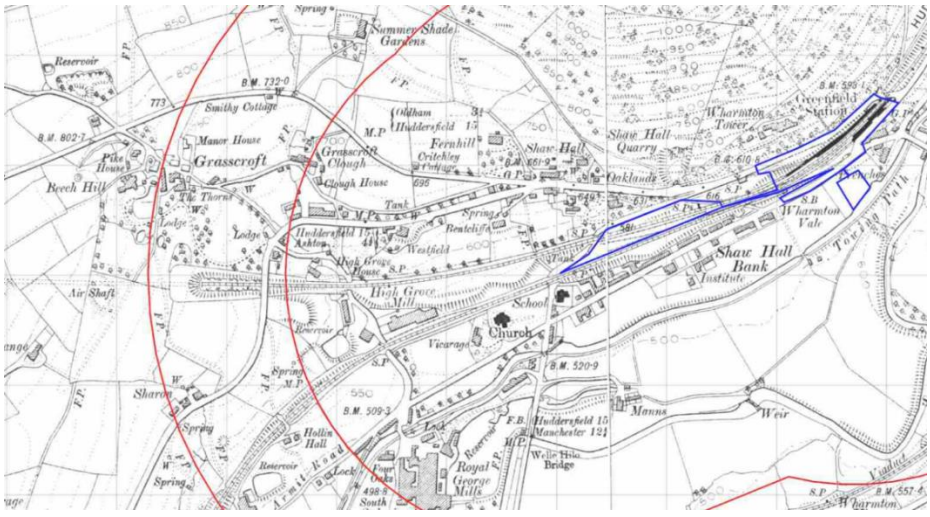
Grasscroft

4.4.47 Grasscroft village lies to the north of Route Section W2B on an area of relatively lower-lying ground. In 1599 the Grasscroft Estate was purchased by the Buckley family, and the estate was subdivided in 1606 (Barrow *et al.* 2023, p.83). Grasscroft largely developed as a result of the woollen industry in the post medieval period. By 1799 Oak View Mill was established under William Whitehead. Gibbs Mills, later called Royal George Mill, was established near Shaw Hall in 1786 by James Harrop and Sons and employed 62 in fulling and scribbling mills. It was built using stone from land occupied by Mrs Whitehead of Shaw Hall. Royal George Mill was bought by the Whitehead family in 1835 (Barrow *et al.* 2023, p.86). In 1837 the Whiteheads let out Oak View Mill, concentrating their efforts on Royal George Mill.

4.4.48 Late in 1840, Angus Reach who was a special correspondent reporting for the Morning Chronicle and made a number of observations on Grasscroft including, what he described as the beautifully situated country factory of Royal George Mills in the deep cleft of a wooded glen and scattered around it are the cottages of the workpeople. Other observations included one interesting branch of the organisation being devoted to flag making [for the navy], those working on this being exclusively women and was an anomaly given their location with the hills of Yorkshire. They would dye, spin and weave the bunting which was then cut into the proper pattern and sewn together in the mill or in the cottages around (Littlewood 2019, pp.17-18).

4.4.49 In 1849 the Whiteheads purchased land from the L.& N.W. Railway Company upon which Christ Church Friezland (NHLE 1356701) was built in 1850. This is of local interest for its association with local architect George Shaw (Barrow *et al.* 2023, p.88). The Whiteheads then gifted the church to the community.

4.4.50 In the 25-inch OS Map of 1893 (not illustrated here), Grasscroft is mostly a rural area with some development flanking Oldham Road and some scattered development further west. Initially, development was sparse, largely limited to Church Road, Shaw Hall Bank Road and Oldham Road, all of which were closely located to the railway, however into the 20th and 21st century, development expanded westwards along Oldham Road in which the presence of the railway helped in this expansion (Insert 4-3).



Insert 4-3 Ordnance Survey 1:10,560 County Series Map 1904, Grasscroft shown the east of the railway corridor

4.4.51 The village has since adopted a suburban character due to the decline of the textile industry. The Royal George Mill latterly made felt for piano hammerheads, prior to its closure and conversion to houses and apartments, albeit its upstanding presence in the town helps recall the industrial heritage of the area.

Uppermill

4.4.52 Uppermill is located within the valley corridor of the River Tame, flanked by the Pennine hills to the east and west. The main development of Uppermill occurred as a result of the improvements in transportation and industrialisation of the textile industry in the post medieval period (Kirkbride 2022). In the late 18th century, only two farmsteads and one mill were recorded in historic maps of Uppermill (Barrow *et al.*, p.147). However, the opening of the turnpike road fuelled commercial activity and in conjunction with powerful local families, the Buckleys and Shaws, considerable entrepreneurial activity in Uppermill (Barrow *et al.*, p.147). This was later accentuated by the impact of the canal and later the railway enabled transport between Lancashire and Yorkshire and as far as Liverpool and Hull (Barrow *et al.* 2023, p.147).

4.4.53 Uppermill was also influenced by the textile industry which was initially undertaken domestically, before the industrialisation of this process and the establishment of mills wherein lighter materials such as shawls and flannels were produced (Barrow *et al.* 2023, p.147). It is likely that the placename is derived from textile activities and suggests that there were mills in both the upper and lower parts of the town (Kirkbride 2022). The railway and station helped to further support and expand the industrial activity in Uppermill. Due to the challenging topography in this area, a 23 span viaduct was built to accommodate the railway (Uppermill Viaduct (MVL3/31)). The viaduct became a prominent landscape feature whose grandeur and robust character testified to the industrial character of Uppermill. Such infrastructure and already prominent industrial and commercial activity resulted in the expansion of Uppermill with amenities for the resident workers and families.

4.4.54 Similarly to other villages, the decline of the textile industry resulted in the redundancy of industrial buildings in the area. Although Uppermill is amongst the larger villages along the railway route, there is no longer a prevailing textile industry or station in the area (Theakston 2017). The character of the village recalls its industrial heritage with weaver's cottages and textile mills present amongst the worker's cottages. The viaduct and canal remain landmark features enabling evidencing the importance of transport and communications to the development and history of Uppermill.

Dobcross

4.4.55 Dobcross is located in a hilly and woodland area north-west of Uppermill, along the River Tame. Dobcross was established at an ancient cross-roads and is recorded to have been the first village in the Saddleworth area (Barrow *et al.* 2023, p.63). The current configuration of the town dates to the post-medieval industrial growth of the region.

4.4.56 Early improvements to connectivity include the 1756 bridge over the River Tame that was built for packhorses, and buildings established along Woods

Lane (Barrow *et al.* 2023, p. 65) Dobcross was at the centre of commercial activity in the Saddleworth area in the early 19th century along with Delph (Kelly Directories 1822). Activity established here included businesses, inns, magistrate's court, banks, chapel, post office, stamp office, warehouse and tradesmen workshops established here (Barrow *et al.* 2023, p.63). However development in Uppermill shifted the commercial centre away from Dobcross (Barrow *et al.* 2023, p.63).

4.4.57 In the six-inch OS map from 1854 (not reproduced here), Dobcross is depicted as a scattered settlement along the turnpike road, nucleated around the main intersection whilst mills and quarries are also shown in the environs of the town along with open/rural fields. The area manufactured 'fancy' woollen cloths such as shawls and flannels, such as those made by John Hirst and Sons 1881 (Kelly Directories 1881). A notable mill in the area was Walk Mill, recorded as one of the oldest mills in the area and run by the Lawton Family (Belmore 2020).

4.4.58 Throughout the 20th century, Dobcross underwent a period of growth and expansion originating at its core and extending eastwards which has blurred the boundary between Dobcross and Uppermill. Similarly to elsewhere in the area, the decline of the textile industry resulted in the removal of numerous mills. Its core has undergone minimal change since its time as the hub of the Saddleworth area in the 18th century, and retains much of its historic character as a post medieval industrial village, best seen in the cobbled village square.

Diggle

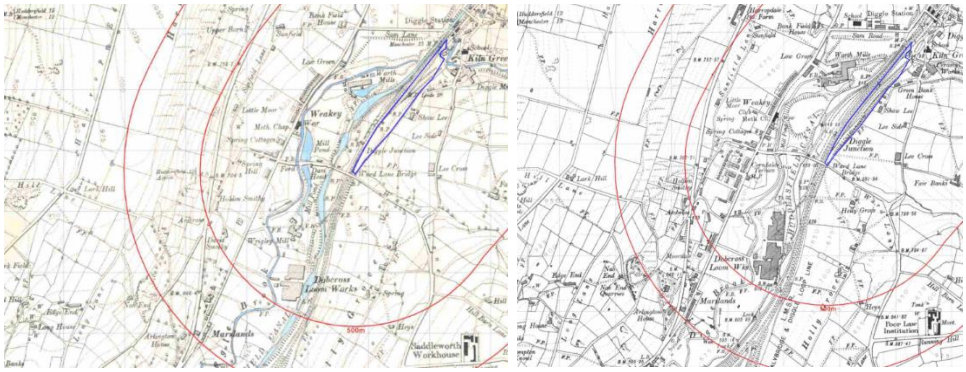
4.4.59 Diggle is located north of Uppermill and Dobcross and was an area of scattered hillside farmsteads below the open moorland owned by the Kirklees Nunnery (Barrow *et al.* 2023, p.49). Diglea appears in the 1822 Kelly's Directory and is recognised as a manufacturing hamlet with a corn mill (Kelly Directories 1822). Improvements in transportation were made to Diggle from the late 18th century which included road turnpiking and the establishment of the Huddersfield Narrow Canal and Standedge Tunnel. The establishment of Standedge Tunnel was a great engineering achievement at this time due to its length and challenge of connecting two villages on different topographical levels and passing under the Standedge escarpment to the north of Diggle. That being said, these transportation improvements did not have a large developmental impact on the village. Until the 18th century, Diggle was a large area of open communal pasture for livestock, some farms and communal meadow (Barrow *et al.* 2023, p.49).

4.4.60 Diggle largely developed from the industrialisation of the woollen industry during the post medieval period. A weaving district along Hanging Gate was established as a small hamlet along the Standedge to Oldham turnpike road to Diggle in the 18th century (Barrow *et al.* 2023, p.57). Warth Mill and

Diggle Mill were both powered by a waterwheel, the latter was the second largest waterwheel in the UK, capable of providing an output of 130 horsepower (Belmore 2020).

4.4.61 The railway contributed towards facilitating the movement of goods and people, whilst the former Diggle Station, located to the south of Standedge Tunnel would have contributed towards the expansion of the village. The character of the settlement which developed during this period took the form of terraced workers' houses made of locally quarried stone to accommodate the influx of workers (Barrow *et al.* 2023, p.49).

4.4.62 In the 25-inch OS Map of 1890 (Insert 4-4) Diggle is a largely scattered settlement with no focal point and open fields on either side of the railway alignment. Development increased, as demonstrated in the 25-inch OS Map of 1933 (Insert 4-4) as can be seen in the new terrace rows and expansion of the mills in the area, including Wrath Mill. In the second half of the century residential development in Diggle between Standedge Road and Huddersfield Road was established.



Insert 4-4 1:10,560 County Series Map of 1890 showing the area of Diggle (left) 1:10,560 County Series Map of 1933 showing the area of Diggle (right)

4.4.63 Diggle is now a linear settlement which is mostly suburban in character. The decline of the woollen industry resulted in the redundancy of various mills in the area including Warth Mill which was rebuilt following a fire in 1915 (Barrow *et al.* 2023, p.55 and 60). It has been converted to office use since becoming redundant as a mill (Theakston 2017).

Huddersfield Narrow Canal

4.4.64 The Huddersfield Narrow Canal, stretching 20 miles from Ashton-under-Lyne to Huddersfield, was constructed to connect the Ashton Canal in the west with the Huddersfield Broad Canal in the east. Envisioned as part of a mid-18th-century plan for direct Transpennine waterways, Acts authorising its construction were passed in 1794. Despite a relatively short length, the canal posed significant engineering challenges, particularly the Standedge Tunnel, which at 3.1 miles is Britain's longest, highest, and deepest canal tunnel. Its construction, fraught with difficulties, claimed around 50 lives and

delayed the canal's opening to 1811. Originally intended for 70ft narrowboats, the canal faced logistical complications as goods had to be transhipped to wider vessels on the Huddersfield Broad Canal. This inefficiency, coupled with competition from the Huddersfield & Manchester Railway, led to the canal's decline. It was purchased by the railway in 1844 and used to assist in constructing the railway tunnel at Standedge. By the early 20th century minimal traffic was seen on the canal and it was officially abandoned in 1944 but retained as a water channel.

4.4.65 Efforts to restore the canal began in the 1970s, culminating in its reopening in 2001 after a £30 million restoration project. The work, driven by the Huddersfield Canal Society and funded by groups including the Millennium Commission, transformed the "impossible restoration" into a celebrated success. Today, it features 74 locks and significant historical structures like Britain's oldest navigable cast iron aqueduct at Stalybridge, designed by Benjamin Outram in 1801.

4.4.66 A total of 22 designated assets associated with the Huddersfield Narrow Canal have been recorded by the HER within the study area. These have been tabulated in Table 4-1:

Table 4-1 Designated assets associated with Huddersfield Narrow Canal

NHLE	Name	Designation
1240125	Huddersfield Narrow Canal, Milestone at SD 979 030	Grade II listed building
1253529	Huddersfield Narrow Canal Milestone at SD 987 043	Grade II listed building
1261184	Huddersfield Narrow Canal, Milestone set in Boundary Wall at SJ 968 988	Grade II listed building
1261754	Huddersfield Narrow Canal Milestone at SD 9990 0677	Grade II listed building
1240125	Huddersfield Narrow Canal, Milestone at SD 979 030	Grade II listed building
1067432	Huddersfield Narrow Canal No. 84 Aqueduct	Grade II listed building
1067433	Huddersfield Narrow Canal No. 66 Bridge	Grade II listed building
1068037	Huddersfield Narrow Canal Winterford Bridge and Lock Number W14	Grade II listed building
1162961	Huddersfield Narrow Canal Scout Tunnel, South Entrance	Grade II listed building
1163263	Huddersfield Narrow Canal Lock No 22W (Dunge Booth Lock)	Grade II listed building

NHLE	Name	Designation
1253530	Huddersfield Narrow Canal Lock adjacent to Ward Road Bridge	Grade II listed building
1253531	Huddersfield Narrow Canal Halls Bridge and Lock 20W at SD 994 049	Grade II listed building
1253532	Huddersfield Narrow Canal Moorgate Bridge	Grade II listed building
1261182	Huddersfield Narrow Canal, Lock 16W Tail Bridge at SD 982 035	Grade II listed building
1261183	Huddersfield Narrow Canal, Black Rock Bridge at SD 976 004	Grade II listed building
1261755	Huddersfield Narrow Canal Subway Under Canal After Lock 30 W	Grade II listed building
1309242	Huddersfield Narrow Canal No. 69 Bridge	Grade II listed building
1309457	Huddersfield Narrow Canal Scout Tunnel North Entrance	Grade II listed building
1309462	Huddersfield Narrow Canal Division Bridge	Grade II listed building
1356465	Huddersfield Narrow Canal Stakes Aqueduct and Tow Path Bridge (Aqueduct Bridge) Over River Tame	Grade II listed building
1356719	Huddersfield Narrow Canal, Lock No.23 (Lime Kiln Lock and Adjoining Tailbridge No.75 And Aqueduct No. 74)	Grade II listed building
1390053	The Royal George Canal Bridge	Grade II listed building

4.4.67 There are an additional 16 non-designated assets recorded in the HER and associated with the Huddersfield Narrow Canal within the study area. These are tabulated in Table 4-2:

Table 4-2 Non-designated assets associated with Huddersfield Narrow Canal

17910.1.0	County boundary stone (former)

Huddersfield and Manchester Railway

4.4.68 The railway connecting Stalybridge to Huddersfield was constructed by the Huddersfield & Manchester Railway Company between 1846 and 1849. The mid-1840s was a period of commercial confidence and massive expansion in the railway network across England, known as 'Railway Mania'. Between 1845 and 1852 the railway network expanded from 2,345 miles to 7,272 miles and included the Stalybridge to Leeds line. Traversing a challenging landscape through the Pennines, the line was planned to follow the route of the Huddersfield Narrow Canal for much of its length, with the canal acquired by the Railway Company the year after its authorisation. These difficult landscape conditions resulted in the need to build several major viaducts and tunnels. These included Standedge

Tunnel through the Pennines, which was constructed alongside the 1811 canal tunnel.

4.4.69 The impact of improved communications, first with the arrival of the canal in 1811, and then the railway in 1849, provided valuable links with Huddersfield, Manchester and Leeds, enabling the import of raw materials and export of manufactured goods. This fuelled the gradual industrialisation and settlement expansion along the Tame Valley. This can be seen on historic OS maps dating from the 19th and early 20th century where industrial development including mills, dyeworks, printworks and quarries, is shown to have been present along the route of the railway and extending into the more upland areas around Saddleworth and Harropdale, with settlements such as Mossley and Dobcross gradually expanding.

4.4.70 The principal engineer for the Huddersfield & Manchester Railway was Alfred Stanistreet (A. S.) Jee (1816–1858), who was assisted by the more renowned engineer Joseph Locke (1805–1860). Jee's work on the Huddersfield & Manchester Railway represents, arguably, his greatest achievement. This can be seen particularly in the construction of the Standedge Tunnel, which at three miles long was one of the longest and most difficult in England, but also through the various large-scale viaducts along the route. In the 1850s, he worked internationally on the Spanish line from Alar-del-Rey to Reynosa where his skill in design, his accuracy and his completeness of the details earned him high praise. He died in a fatal accident upon the opening of the second portion of that line.

4.4.71 In 1847, prior to the opening of the line, the Huddersfield & Manchester Railway Company was taken over by the London and North Western Railway (LNWR). As part of the LNWR network, the Huddersfield & Manchester Railway formed part of a direct route from Manchester to the West Riding, enabling the LNWR to access the textile and coal industries of West Yorkshire. By 1851, the LNWR was the most prominent railway company of the period, with over 800 miles of track and was the largest joint-stock concern of its time, capitalised at £29 million. The line was acquired by the London Midland and Scottish Railway in 1923, before being nationalised in 1948.

4.4.72 Whilst other parts of the Transpennine route were subject to significant alterations, the Huddersfield & Manchester Railway between Standedge Tunnel and Stalybridge was subject to relatively limited alteration.

4.4.73 The Oldham branch of the LNWR was opened in 1856, six years after the Huddersfield & Manchester Railway. This line branched westwards from the Huddersfield & Manchester Railway in the Friezland area, running into Lydgate Tunnel towards Lees.

4.4.74 The Micklehurst Loop was constructed from 1881-85 to provide additional capacity, and diverged from the existing railway to the east of the Tame Vally, avoiding physical interaction with the majority of its alignment. A

Goods Station was established on the Micklehurst Loop to the south of Mossley including a large goods warehouse and coal yard, whilst the east of the Order Scheme, additional sidings were established in Diggle to service the loop. The railway was also widened to the east of Diggle to accommodate additional tracks serving new bores for the Standedge Tunnel which were added in 1868-71 and 1894, necessitating widening of bridges to the east of the route.

4.4.75 Piecemeal change has occurred, most notably with the closure of a small number of stations along the route, such as Diggle and Saddleworth Stations. The route today forms part of the wider Transpennine route between York, Selby and Manchester, which comprises sections of rail line developed by different railway companies.

4.4.76 The history and significance of the Transpennine rail route is discussed at more length in the Route-Wide Statement of Significance (Alan Baxter Associates 2024). This was produced to characterise the overall heritage significance of the Transpennine route as a whole.

4.4.77 Historic railway structures survive along the Order Scheme including overbridges and underbridges ranging in date from the mid-19th to late 20th century, and the building of Mossley Station[14] which was constructed contemporarily with the Huddersfield & Manchester Railway.

Textile industry

4.4.78 The HER records 68 mills within the study area. Many of these have been identified from historic records and maps and are no longer extant. However, some structures remain such as the grade II Brownhill Bridge Mill (NHLE 1309426) and 24 non-designated mills (13850.1.0, 18088.1.0, 18990.1.0, 3301.1.0, 3306.1.0, 3307.2.0, 3312.1.0, 3337.1.0, 3338.1.0, 3368.1.0, 3376.1.0, 3382.1.0, 3476.1.0, 5592.1.0, 6045.1.0, 6094.1.0, 6097.1.0, 6098.1.0, 6104.1.0, 6105.1.0, 6109.1.0, 6110.1.0, 6342.1.0, 6360.1.0). Britannia Mill (still extant; 3307.1.0), River Mill (3308.1.0), Queen Street Mill (3305.1.0), and Longlands Mill (still extant; 3306.1.0) were located within 200 m of the Order Scheme in Mossley. This concentrated arrangement could be the result of the advantageous proximity to the River Tame. A similar cluster is visible in Stalybridge, within 500 m of the Order Scheme.

Other Post-medieval activity

4.4.79 There are a total of 77 other, non-listed historic structures in the study area (outlined in full in the Gazetteer in Annex A). These have been identified on the GMAAS HER as potential candidates for local listing. The oldest buildings date back to the 18th century, including 1 Diglea (19004.1.0), 3

[14] Mossley Station is located outside the Order Scheme boundary and is considered as an offline asset for the purpose of this assessment.

Diglea (19003.1.0), and Bloomer Cottage (19005.1.0). The 19th century saw a significant increase in construction, with buildings like Grove House (18986.1.0), Albert House (17828.1.0), Midge Hall (487.1.0), Spring Cottages (2180.1.0) and Annaville Terrace (17917.1.0), as well as mills.

4.4.80 Several public houses were also established during this time, such as The Rising Sun (17908.1.0), The Britannia Inn (17875.1.0), The Shears Inn (17903.1.0), the Commercial Inn (17870.1.0), The Gate Inn (19001.1.0), The Church Inn (17906.1.0) and The Roaches Lock (17920.1.0)

4.4.81 The turn of the 20th century brought about the construction of civic buildings like Stalybridge Fire Station (2184.1.0) and Mossley Police Station (2175.1.0), as well as the creation of seven schools such as Friezland School (19058.1.0), Diggle Primary School (19002.1.0), Kiln Green School (19000.1.0), Milton St John's School (17911.1.0), St Joseph's School (17891.1.0), and Livingstone Primary & Nursery School (17866.1.0).The Palace Cinema (2179.1.0) also opened its doors in the early 20th century. Finally, more modern structures like Mitre House (17825.1.0) were built in the 20th century for the Bury Street Working Men's Club, reflecting changing social and economic needs.

4.4.82 There are 121 post-medieval listed buildings recorded within the vicinity of the Order Scheme, as well as Close Gate Bridge (1005797), a scheduled monument located approximately 980m north-west of the Order Scheme. These listed buildings are primarily focused around the settlements of Stalybridge, Mossley, Uppermill and Dobcross. These assets are predominantly post-medieval houses built for workers, however the large number of listed structures associated with canal and railway infrastructure and demonstrates how increased mobility transformed the landscape.

Historic Landscape Character

4.4.83 The information in this section is from the Greater Manchester Historic Landscape Characterisation survey data (Redhead 2012, Lun *et al. 2017)*, as well as the local Oldham and Tameside landscape character studies (GMAU 2012a, 2012b). It considers broad historic landscape types and features located within the 250 m study area.

4.4.84 The Order Scheme itself is a historic landscape, comprising a number of railway lines including a section of the Manchester, Sheffield & Lincolnshire line between Audenshaw and Stalybridge (HGM39393), the Huddersfield & Manchester Line between Stalybridge & Mossley (HGM39387) and between Scout Tunnel & Woodend, Mossley HGM39392), between Mossley and Grasscroft (HGM39390), from Grasscroft to Shaw Hall (HGM17331), at Shaw Hall (HGM17330; HGM17329), Uppermill (HGM17327), Uppermill Viaduct at Dobcross (HGM17326), Dobcross former Saddleworth Station (HGM17325) and Diggle to Standedge tunnel, including Diggle Station and sidings (HGM16980). The HLC notes the Delph Branch Line ("Delph Donkey") at Brown Hill, Uppermill which closed

1955 and survives as an earthwork (HGM17153). Other key transport features include the River Tame and the Huddersfield Narrow Canal, opened in 1811.

4.4.85 To the east of the Order Scheme are numerous industrial heritage assets, including historic mills once powered by the River Tame. These include Tameside Mill at Stalybridge (HGM44609; MGM4268), immediately south-east of the Order Scheme, a surviving mill complex built by 1775 as a cotton mill and later, a paper mill. To the north, also adjacent to the Order Scheme, is the site of large factory originating as part of Riverside Mills, built by 1911 and expended to the north after 1956 (HGM44603; MGM6940). There are further industrial buildings at Souracre on the site of a demolished 19th century mill, River Meadow Mill (HGM44577; MGM4158; MGM4159; MGM4160). South of Mossley is the 19th century Weir Mill (HGM42445) now the Chicago Powder Coating Works and the Mossley Electro Platers (Works), situated in buildings that originated as a row of terraces possibly associated with Weir Mill (HGM42442). The 20th century New Scout Mill, Mossley replaces the original Scout Mill, a fulling mill c. 1777 and a cotton mill from 1793 to 1935 (HGM42438; MGM7397). East of the route at Grasscroft is the site of the 19th century Lower Grove Print Works; the reservoir is extant and the ground undisturbed (HGM17758). North of the Order Scheme at Grasscroft is the site of a reservoir, west of High Grove Road (HGM18142); this is probably associated with the Charlotte Mill (cotton), built in 1791. North of Uppermill Viaduct (MVL3/31), industrial sites are separated from the railway by the Huddersfield Narrow Canal.

4.4.86 There are large bands of regenerated woodland and scrub adjacent to the railway, as well as urban and suburban residential development, industrial areas, and allotments. The railway passes through some areas of complexity, including:

- The Heyrod Estate, noted in 15th century records; Heyrod Old Hall may have been located immediately east of the Order Scheme boundary (MGM1113). Heyrod Hall was rebuilt in the 19th century after the construction of the railway through the estate (HGM44542; MGM1114). To the west of the railway, housing was built on part of the grounds of the Hall in the 1950s (HGM44008). To the east, Hartshead Power Station operated east of Heyrod from 1926 until it was demolished in the 1980s; some buildings survive (HGM44414; HGM44566).
- Mossley, the Order Scheme passes a car park opposite 43 Manchester Road, which has a retaining wall formed of the wall of a railway goods shed (HGM42424). Victorian terraces centred around Stanhope Street developed around central yards or greens (HGM42308). South of Mossley Station, the mid-19th century cottages at 12 to 56 Manchester Road back onto the railway cutting (HGM42284; Mossley Cottages). The Commercial public house on Manchester Road (HGM42636) may

date to the mid-18th century (HGM42636); shops at 60 to 62 Manchester Road & 3 Old Brow were originally three-storey back to backs added to the adjacent public house by 1894 (HGM42638).

- South of Wright's Overbridge (MVL3/23) (MGM19523) at Grasscroft is the former site of a 19th century detached house, Hollin Hall and Hollin Barn, Low Grove Lane, with the building footprint preserved in the land boundaries (HGM17757).

4.4.87 Land adjacent to the Order Scheme includes agricultural land between settlements, particularly in the north of the Order Scheme; much of this is pastureland located on relatively steep slopes. North of Mossley are areas of assarts, early post-medieval enclosures reclaimed from moorland and large regular fields used for rough pasture. At Diggle, there is an area of possible former drained wetland at Marshlands, East of Huddersfield Road.

4.4.88 The Order Scheme passes through stands of regenerated woodland, sometimes growing on former 19th century terraces or industrial sites, and on land isolated by the construction of the railway and the canal. This includes woodland south of Heyrod Villa on land isolated by the development of the railway to the west and industrial sites to the east (HGM44570), on the site of demolished 19th century dwellings, Heyrod (HGM44420). There is semi-natural woodland on the western slopes of the River Tame West of Scout Mill, Mossley (HGM42434). There is woodland on the slope between the railway and Manchester Road, Mossley on the site of demolished terraces (HGM42939).

4.4.89 Areas of former 19th and earlier 20th century quarrying include quarries north of Stalybridge, at Heyrod, Mossley and the Ladcastle Quarries, Dan Quarries and Moorgate Quarry, West of Oldham Road, Uppermill and Brownhill Bridges, Dobcross.

4.4.90 There are 20th century sewage works adjacent to the route at Blackrock (HGM44400; HGM44401) and at Weir Mill, Mossley (HGM42449).

4.5 Significance of Heritage Assets

Online Heritage Assets: Designated Heritage assets

4.5.1 Designated heritage assets that are located on Route Section W2B are identified in this assessment as ‘online’ structures.

4.5.2 There are 14 online designated assets. These are outlined in Table 4-3 below, and mapped in Figures 5.1.1 – 5.1.9. These were erected for the Huddersfield & Manchester Railway and the LNWR in the mid-19th and late 19th century. These structures comprise over and under bridges, a viaduct (Uppermill Viaduct (MVL3/31)), and tunnel portals. All 14 designated online assets are grade II listed and are assessed to be of medium significance.

Table 4-3 Online Designated Heritage Assets

NHLE Ref	NR Ref	Asset Name	Designation
1449242	MVL3/7	Heyrod Hall Overbridge	Grade II listed building
1452382	MVL3/8	Springbank Lane Footbridge	Grade II listed building
1449241	MVL3/9	Springbank Lane Overbridge	Grade II listed building
1452392	MVL3/10	Manchester Road Underbridge	Grade II listed building
1452399	MVL3/11	Railway tunnel portal, MVL3/11 Scout Tunnel (south end)	Grade II listed building
1452405	MVL3/17	Roughtown Road Overbridge	Grade II listed building
1452406	MVL3/20	Wright's Mill Overbridge	Grade II listed building
1452409	MVL3/23	Wright's Overbridge	Grade II listed building
1451848	MVL3/25	Royal George Overbridge	Grade II listed building
1451852	MVL3/26	Shaw Hall Bank Road Footway	Grade II listed building
1451853	MVL3/28	Oldham Road Overbridge	Grade II listed building
1451854	MVL3/29	Wickens Underbridge	Grade II listed building
1068120	MVL3/31	Uppermill Viaduct	Grade II listed building
1452141	MVL3/41	Diggle Portal, Standedge Tunnel west portal	Grade II listed building

4.5.3 Of the listed online structures identified above, 12 are subject to works to facilitate the Order Scheme in order to accommodate electrification and increased line speed. The assessment for these structures has been undertaken in their respective Heritage Statements prepared in advance of listed building consents. Those assets which are covered in their separate listed building consent applications comprise:

- Heyrod Hall Overbridge (MVL3/7) (NHLE 1449242);
- Springbank Lane Footbridge (MVL3/8) (NHLE 1449241);
- Springbank Lane Overbridge (MVL3/9) (NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (NHLE 1452405);
- Wright's Mill Overbridge (MVL3/20) (NHLE 1452406);
- Wright's Overbridge (MVL3/23) (NHLE 1452409);
- Royal George Overbridge (MVL3/25) (NHLE 1451848);
- Shaw Hall Bank Road Footway (MVL3/26) (NHLE 1451852);
- Oldham Road Overbridge (MVL3/28) (NHLE 1451853);

- Wickens Overbridge (MVL3/29) (NHLE 1451854); and
- Uppermill Viaduct (MVL3/31) (NHLE 1068120).

4.5.4 These online designated heritage assets are also recognised for their inherent group value with each other given their association with A. S. Jee and the Huddersfield & Manchester Railway built between 1845 and 1849. These structures are of significance for their individual architectural and historic value, as well as their value as a group.

4.5.5 Jee's coherent approach to design remains evident in the use of a common design language across the masonry structures, using segmental or semi-circular arches, rusticated stepped voussoirs, stringcourses and quarry-faced stonework, executed using high quality craftsmanship, elevating these structures above the purely functional. These structures form a group with other listed masonry bridges and viaducts erected by Jee for the Huddersfield & Manchester Railway outside the Route Section W2B[15]. These comprise:

- Heyrod Hall Overbridge (MVL3/7) (grade II listed, NHLE 1449242);
- Springbank Lane Footbridge (MVL3/8) (grade II listed, NHLE 1452382);
- Springbank Lane Overbridge (MVL3/9) (grade II listed, NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (grade II listed, NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (grade II listed, NHLE 1452405);
- Wright's Overbridge (MVL3/20) (grade II listed, NHLE 1452409);
- Wright's Mill Overbridge (MVL3/23) (grade II listed, NHLE 1452406);
- Royal George Underbridge (MVL3/25) (grade II listed, NHLE 1451848);
- Shaw Hall Bank Road Footway (MVL3/26) (grade II listed, NHLE 1451852);
- Oldham Road Overbridge (MVL3/28) (grade II listed, NHLE 1451853);
- Wickens Underbridge (MVL3/29) (grade II listed, NHLE 1451854);
- Slaithwaite Viaduct (MVL3/61) (grade II listed, NHLE 1224049);
- Golcar Viaduct (MVL3/70) (grade II listed, NHLE 1276344);
- Milne Viaduct (MVL3/76) (Longwood Viaduct) (grade II listed, NHLE 1220121);

[15] Wheatley's Overbridge (MVL3/103) (grade II listed NHLE 1450537) was designed by A.S. Jee for the Huddersfield & Manchester Railway. The Overbridge was granted consent for extensive change as part of the Huddersfield to Westtown (Dewsbury) Order section of the Transpennine Route Upgrade, and will be demolished and replaced with a new structure (ref 2021/91337). This is likely to result in de-listing. As such its contribution to group value has therefore been excluded from this assessment.

- Church Street (MVL3/82) (grade II listed, NHLE 1452083);
- Huddersfield Viaduct (MVL3/92) (grade II listed, NHLE 1223531);
- Hillhouse Lane Underbridge (MVL3/94) (Willow Lane East) (grade II listed, NHLE 1432641); and
- B6118 Colne Bridge Road Overbridge (MVL3/107) (grade II, NHLE 1450265)[16].

4.5.6 An outlier within the structures erected for the Huddersfield & Manchester Railway, Royal George Underbridge (MVL3/25) (NHLE 1451848) has a cast iron span, springing from stone abutments, the balustrades of which are ornamented with gothic detailing. This bridge forms a group with a small number of surviving cast iron structures erected for the Leeds, Dewsbury & Manchester Railway under Thomas Grainger between 1845 and 1847. These include the large-scale structures of Calder and Hebble Canal Bridge (MDL1/6) (grade II listed, NHLE 1183783) and River Calder Bridge (MDL1/8) (grade II listed, NHLE 1313646), as well as more modest structures such as Toad Holes (MDL1/12, NHLE 1049912), Ming Hill (MDL1/14, NHLE 1451887) and George Street (MDL1/16, NHLE 1451888).

4.5.7 The designated online bridges are not innovative for their period, but are good examples of their type and time. As a group they have been subject to limited alteration and today provide an understanding of the wider trends and engineering achievement which characterise both the Huddersfield & Manchester Railway and the Heroic Age (1841-50) of railway building. This group value is enhanced by the structures continuing to form part of the operational railway; as a collective group of assets, they are experienced by those travelling along the railway line, or near it) as coherent features of a single historic route.

4.5.8 The outstanding engineering feature of the Huddersfield & Manchester Railway is Standedge Tunnel. The first bore was constructed in 1847 – 1848, and worked from the adjacent tunnel for the Huddersfield Narrow Canal, with eight ventilation shafts required along the tunnel's passage through the Pennines for a distance of over three miles. The addition of two further bores in the 1860s and 1890s created a complex of interconnected tunnels which together with the canal tunnel illustrate the evolution and expansion of the transport network across the Pennines (Alan Baxter Associates 2024, p.39). The east and west tunnel portals (MVL3/40 & MVL3/41) are designated as grade II in recognition of their historic and architectural value, and group value with the canal tunnel.

Online Heritage Assets: Non-designated heritage assets

[16] B6118 Colne Bridge Road Overbridge (MVL3/107)) (grade II, NHLE 1450265) will be partially demolished and rebuilt with a supplementary structure replacing its spans over the railway. Listed building consent has been granted for this considerable intervention (ref: 2021/91330), and as a result may limit the contribution that this bridge makes towards the group value with the Jee bridges.

4.5.9 Online non-designated assets identified in the historic environment baseline are characterised as heritage assets that have no formal designation, but are recorded in the HER or have been identified through research and assessment undertaken for the TRU project (Alan Baxter Associates 2024) and are located on the alignment of the Transpennine route. These are shown on Figures 5.1.1 – 5.1.9.

4.5.10 A total of 24 non-designated online heritage assets have been identified, all of which comprise historic structures associated with the railway. These include underbridges, overbridges, pipe-bridges, tunnel portals, culverts and a signal box. The construction typologies of bridges in this group include arch, beam, and girder bridges. The majority of these were constructed for the Huddersfield & Manchester between 1845 and 1849, under the engineer A.S. Jee. When built, these structures were of similarly high-quality design, detailing and construction as their designated counterparts. These structures have, however, been subject to substantial alteration during the later 19th or 20th centuries, reducing their significance to low or negligible depending on the survival of historic fabric. Of interest within this group is Manchester Road Footbridge (MVL3/10A), which was erected for the LNWR in the later 19th century, and survives as an example of an LNWR footbridge with enriched detailing.

4.5.11 It is considered likely that the original construction of the Huddersfield & Manchester Railway will have removed any archaeological remains within railway cuttings. Horizons which may contain archaeological remains will be buried, in places, beneath embankments which may have compressed deposits, but may also form a protective and sacrificial buffer layer. Within the Order Scheme boundary, it is likely that elements of evidence for 19th century railway construction and a palimpsest of subsequent repairs and modifications survive. It is therefore considered that the likelihood of impacts upon archaeological remains within the Order Scheme boundary are low.

4.5.12 These non-designated online heritage assets are considered to be of low or negligible significance, based on their limited heritage significance, the extent to which they have been altered and extent of survival of historic fabric.

Offline Heritage Assets: Designated heritage assets

4.5.13 Offline designated heritage assets identified in the historic environment baseline constitute designated heritage assets identified within the 250 m study area, excluding those located on the Transpennine route.

4.5.14 There are 129 offline designated heritage assets identified within the 250 m study area of the Order Scheme. These are summarised in Table 4-4 below and shown on Figures 5.2.1-5.2.9:

Table 4-4 Significance of offline designated heritage assets

Designation	Significance	Count
Scheduled monuments	High	0
Grade I listed building	High	0
Grade II* listed building	High	1
Grade II listed building	Medium	120
Grade II registered parks & gardens	Medium	0
Conservation areas	Medium	8

4.5.15 There are no World Heritage Sites, scheduled monuments, registered parks and gardens or registered battlefields identified within the study area.

4.5.16 All offline designated heritage assets identified within the study area date from the post-medieval period, largely from the 18th and 19th centuries. This reflects the historic development of settlements along the route during this period. The character of the designated heritage assets also reflects the development of the region during this period, with buildings of industrial character surviving throughout the area, as well as infrastructure relating to the canal and railway.

4.5.17 There are 21 grade II designated assets relating to the Huddersfield Narrow Canal. These are assessed to be of medium significance given their inherent historic and architectural values. These include:

- Bridges: Huddersfield Narrow Canal No. 66 Bridge (NHLE 1067433) and No. 69 Bridge (NHLE 1309242), Winterford Bridge (NHLE 1068037), Moorgate Bridge (NHLE 1253532), Black Rock Bridge (NHLE 1261183), Division Bridge (NHLE 1309462), the Stakes Aqueduct and Tow Path Bridge (NHLE 1356465), and The Royal George Canal Bridge (NHLE 1390053).
- Tunnel entrances: Scout Tunnel, south entrance (NHLE 1162961), and north entrance (NHLE 1309457).
- Locks: Lock No. 22W (Dunge Booth Lock) (NHLE 1163263), Lock Adjacent to Ward Road Bridge (NHLE 1253530), Lock 20W at Halls Bridge (NHLE 1253531), Lock 16W Tail Bridge (NHLE 1261182), Lock

No. 23 (Lime Kiln Lock and Adjoining Tailbridge No. 75 and Aqueduct No. 74) (NHLE 1356719).

- Aqueducts: the Huddersfield Narrow Canal No. 84 Aqueduct (NHLE 1067432)
- Subways: Subway Under Canal after Lock 30W (NHLE 1261755)
- Milestones: milestone at SD 979 030 (NHLE 1240125), at SD 987 043 (NHLE 1253529), set in a boundary wall at SJ 968 988 (NHLE 1261184), and at SD 9990 0677 (NHLE 1261754).

4.5.18 There is one offline designated heritage asset considered to be of High significance. This comprises the grade II* listed war memorial in Stalybridge (1163074). The remaining offline designated heritage assets, comprising grade II listed buildings and conservation areas are considered to be of medium significance. The scheduled monuments previously discussed, including Buckton Castle (NHLE 1015131) are outside of the 250 m study area, and have been assessed to be of high value.

4.5.19 Eight conservation areas have been identified through this assessment. All are assessed to be of medium value.

4.5.20 Designated as a conservation area in 1991, Stalybridge town centre (DGM2201) is an industrial Pennine town with a significant historic character shaped by its transport routes and mill buildings (see 4.4.33 above). The conservation area is characterised by buildings from the late 18th and 19th centuries, constructed from local stone and aligning along streets such as Market Street, Melbourne Street, and Grosvenor Street. The town's organic development follows the valley's contours, creating varied vistas and connecting closely with the Pennine landscape. Panoramic views of Hollingworth Moor contribute to its character, grounding it in its location within the Pennine landscape. The conservation area is included on Historic England’s Heritage At Risk Register 2024 due to its poor condition. To address this, Historic England and TMBC initiated projects between 2020 and 2024 as part of the Heritage Action Zone (HSHAZ), which focused on restoring the Civic Hall, historic shop fronts, and developing a Heritage Walk along Market Street.

4.5.21 Millbrook Conservation Area was designated in 1991. The conservation area is established along the north-east to south-west axis of Huddersfield Road and encompasses the planned Victorian industrial village of Millbrook, set within natural topography of the Swineshaw Valley. The area developed around key mills in the area; Staley (Howard), Staley (Kernshaw) and Oakwood mills, which were prominent features in the establishment of the industrial character. Millstone grit is the predominant building material used throughout Millbrook, contributing towards a unified townscape and forming a key element of the area’s overall character and appearance. The millstone setts are considered to be an important feature in the area. Stone terrace houses dating from c. pre-1850 with internal

courtyards to the west of Huddersfield Road, are also key features. Larger buildings such as St James's Church and School, Oakwood Mill and mill owner/managers houses flank Huddersfield Road and help frame the route through the conservation area. Situated within the Swineshaw Valley on the lower slopes of the eastern side of the Tames Valley, the conservation area benefits from distinctive viewshed. The views into and out of the conservation area capture the industrial character of Millbrook against the Pennine landscape in the surrounding area and contributes towards its overall appearance.

4.5.22 Designated as a conservation area in 1982, Royal George Mills (DGM3182) covers 15.41 hectares and lies between the River Tame and the Huddersfield Narrow Canal, west of Greenfield. Originally known as Gibbs Mills, it was built in 1786 and renamed in 1800 to honour King George III. The Whitehead Brothers acquired the mills in 1835, leading to their growth and influence in the local area. Initially focused on wool production, the mills later specialised in felt making. The complex, recently converted to residential use, has significant historical importance for its role in the local economy and industry.

4.5.23 Designated as a conservation area in 1977, Uppermill (DGM3166) covers 30.41 hectares and is situated in a picturesque rural location surrounded by dramatic moorland hills. The village is characterised by post medieval buildings, with public and commercial buildings along High Street and residential areas behind. A characteristic feature of the settlement is the use of natural stone, transitioning from traditional elongated window openings and stone flag roofs to square window openings and Welsh blue slate roofs during the 19th century. The area is home to an intact collection of domestic stone buildings, showcasing historical Pennine design. Significant landmarks include the Huddersfield Narrow Canal, completed in 1811, and the nearby Uppermill Viaduct (MVL3/31) from 1849. The canal, once a busy transport route, now forms a valuable leisure route through the conservation area evidencing the role of communications in the history of the settlement. The conservation area boundary aligns with the 19th-century village limits, excluding later suburban expansion.

4.5.24 Dobcross (DGM3168), designated as a conservation area in 1972 and located west of the A670, covers 5.74 hectares. The settlement is situated between Uppermill and Diggle. The settlement follows the Pennine moorland pattern, with buildings clustered along narrow roads forming irregular squares. Notable features include the Ramsden Memorial and the Church of the Holy Trinity, built in the 1780s. The buildings, constructed of blackened local gritstone, have mullion windows and slate roofs, with few timber elements. The area includes mature trees, open spaces, and interesting vistas, emphasising its organic growth and strong community ties.

4.5.25 Holly Grove Conservation Area was designated in 1988 and encompasses a small rural small hamlet with structures dating from the 18th to 20th centuries. The majority of these structures are grade II listed and include farmhouses, houses, cottages and a wool wall. The presence of a wool wall indicates the domestic production of woollen cloth in the area. Construction in the conservation area is characterised by the use of hammer-dressed watershot stone with graduated stone slate roofs for residential structures, and rubble sandstone masonry for the wool wall. The setting of the conservation area is rural, views into and out of the conservation area framed by trees and stone boundary walls with distant views of the Pennines, particularly from the approach along Butterhouse Lane.

4.5.26 The historic character of Delph, Saddleworth (DGM3169) stems from its mix of building types, reflecting its development during the Industrial Revolution. The central area focused around King Street, is the oldest part and features a dense grid of streets with shops, houses, workshops, and community facilities. The outer areas are characterised by linear, residential terraces along major roads like Stoneswood, Grains, Denshaw, and Delph Lane, dating from the 19th and 20th centuries. These residential corridors are separated by open spaces that preserve the village's small-scale, rural character. The Valley Mills complex, linking Delph with New Delph, contrasts with the smaller-scale development. The setting of the conservation area is defined by surrounding hills, with significant views from King Street towards Heights Chapel and across the valley. Modern growth formed by post-war housing is present outside but adjacent to the conservation area.

4.5.27 Harrop Green (DGM3171), designated a conservation area in 1972 and covering 0.78 hectares, is located north-west of Diggle, near the Pennine Moors and the Peak District. Most buildings within the conservation area date to the 18th century or earlier, with evidence of the handloom textile industry visible in the presence of weaver’s windows across the upper storeys, horizontal multiple windows which illuminated textile workshops. The construction of the Huddersfield Narrow Canal and the Huddersfield & Manchester Railway separated Harrop Green from Diglea. The settlement is characterised by the position of buildings integrated into the hillside, resulting in varying storey heights. The organic layout provides unexpected vistas, with hard floorscapes and stone walls separating public and private spaces. The use of local gritstone and grey slate, along with mullion windows, reflects the settlement’s adaptation to the Pennine climate. Open spaces with mature trees play a key role in the area’s character.

4.5.28 Diglea (DGM3172), also designated in 1972, spans 1.33 hectares and lies north-west of Diggle Village, near the Peak District and Pennine Moors. Buildings date predominantly from the 18th century, though some may be older. Originally a farming hamlet, Diglea and Harrop Green were separated by the construction of Huddersfield Narrow Canal and the Huddersfield & Manchester Railway. The settlement follows the Pennine

moorland pattern, with structures set into the hillside, creating varied roof lines. This introspective layout features corners and sudden level changes that frame long-distance views. The use of local gritstone, grey slate roofs, and mullion windows highlights the adaptation to harsh conditions. Open spaces at route junctions contain mature trees, contributing to the village's scene. The area is characterised by the presence of a hard floorscape with stone walls defining private gardens.

Offline Heritage Assets: Non-designated Heritage assets

4.5.29 Offline non-designated heritage assets identified in the historic environment baseline comprise those non-designated heritage assets recorded on the Greater Manchester HER and identified during the walkover surveys within the 250 m study area.

4.5.30 There are 201 offline non-designated heritage assets located within the 250 m study area. The location of these in relation to the Order Scheme, are shown on Figures 5.3.1-5.3.9.

4.5.31 The offline non-designated heritage assets identified within the historic environment baseline include historic buildings or structures and the sites thereof, buried archaeological remains, and evidence relating to place names or historic mapping suggesting archaeological potential. The non-designated heritage assets are primarily of post-medieval date, comprising particularly industrial buildings and 19th century houses. There are no non-designated assets identified within the study area dating to the Romano-British or early medieval periods.

4.5.32 The significance of historic landscape character areas and components vary, depending on the degree to which they are intact, their scale, legibility, linkage to extant heritage assets and their capacity to address regional research agendas. Landscape values such as amenity and tranquillity are not considered within this heritage-specific assessment. The historic landscape is considered to have negligible significance for modern and intrusive developments, and low or medium significance for elements of medieval and post-medieval agricultural, industrial and transport landscapes that are intact, legible and contribute to historic character and .

4.5.33 The majority of the non-designated assets identified in the study area are considered to be of low or negligible significance, based on their heritage significance, local interest and extent of survival.

4.5.34 The HER records a number of archaeological find spots considered to have been removed or destroyed. These sites are not considered heritage assets in themselves, as there cannot be impacts on archaeological finds which have been removed. However, they provide evidence of the potential for as-yet unknown archaeological deposits within the study area.

4.5.35 Archaeological remains may survive in areas of compounds, haul roads and laydown areas. Their survival depends on the depth of remains and the extent of any previous ground truncation caused by previous development.

5. DEVELOPMENT PROPOSALS & IMPACT ASSESSMENT

5.1.1 The following designated assets within the Order Scheme boundary are subject to their own assessment in a series of Heritage Statements (Network Rail 2025) prepared for listed building consent. As such, impacts upon these structures and their group value are not assessed within this report:

- Heyrod Hall Overbridge (MVL3/7) (NHLE 1449242);
- Springbank Lane Footbridge (MVL3/8) (NHLE 1449241);
- Springbank Lane Overbridge (MVL3/9) (NHLE 1449241);
- Manchester Road Underbridge (MVL3/10) (NHLE 1452392);
- Roughtown Road Overbridge (MVL3/17) (NHLE 1452405);
- Wright's Mill Overbridge (MVL3/20) (NHLE 1452406);
- Wright's Overbridge (MVL3/23) (NHLE 1452409);
- Royal George Overbridge (MVL3/25) (NHLE 1451848);
- Shaw Hall Bank Road Footway (MVL3/26) (NHLE 1451852);
- Oldham Road Overbridge (MVL3/28) (NHLE 1451853);
- Wickens Overbridge (MVL3/29) (NHLE 1451854); and
- Uppermill Viaduct (MVL3/31) (NHLE 1068120).

5.2 Impact Assessment

5.2.1 Potential effects arising from construction and operation of the Order Scheme could comprise both physical impacts to buried archaeological remains and online non-designated historic structures, as well as changes to the setting of heritage assets.

5.2.2 Within the Order Scheme boundary, any intrusive groundworks, vegetation clearance or topsoil stripping may expose surviving non-designated archaeological remains associated with railway and canal infrastructure, or temporary site facilities and camps associated with railway construction. These may be damaged by rutting, crushing and compaction caused by the movement of plant and vehicles. Groundworks have the potential to truncate or wholly remove any remains present within the footprints of excavations.

5.2.3 At offline compounds, haul roads, working areas and laydown areas, intrusive groundworks or topsoil stripping may expose any surviving

underlying archaeological remains, which may be damaged by rutting, crushing and compaction caused by the movement of plant and vehicles. Groundworks have the potential to truncate or wholly remove any remains present within the footprints of excavations.

Non-designated built heritage assets

5.2.4 The TWAO works would result in physical impacts on six non-designated online heritage assets. These comprise:

- Demolition of Stamford Road Pipebridge ((MVL3/12A); negligible value);
- Reconstruction of three bridges (Manchester Road Footbridge (MVL3/10A), Roughtown Road Footbridge (MVL3/18), Ward Lane Overbridge (MVL3/36); all of negligible value), resulting in total loss of significance;
- Partial reconstruction of one bridge (Station Road Overbridge (MVL3/39); negligible value); and
- Addition of a concrete saddle to Standedge Canal Tunnel (MVL3/39A; low value).

5.2.5 Reconstruction would result in total loss of significance for Manchester Road Footbridge (MVL3/10A), Roughtown Road Footbridge (MVL3/18), Ward Land Overbridge (MVL3/36), all of which have been assessed to be of negligible value.

5.2.6 The partial reconstruction of Station Road Overbridge (MVL3/39) and minor alterations of Standedge Canal Tunnel (MVL3/39A) would result in some harm to significance, however their historic form and function would continue to be understood.

Non-designated archaeological remains

5.2.7 It is anticipated that the construction of the railway in the mid-19th century, and subsequent maintenance activities, is likely to have removed earlier archaeological deposits within the railway corridor.

5.2.8 A number of offline areas are required for the TWAO, such as compounds, laydown areas, vehicle, plant and materials access routes, road and PRoW upgrades, works areas and areas of drainage and utility works.

5.2.9 Archaeological remains may survive in some of these areas. Their survival and condition depends on factors including the depth of remains and the extent of any previous ground truncation caused by previous development.

5.2.10 The archaeological walkovers undertaken in in 2024 and 2025 identified that much of the land-take for the Order Scheme has already been subject to modern ground disturbance and previous construction impacts, with

several areas on terraced or levelled ground, particularly immediately adjacent to the railway.

5.2.11 The design of these offline elements is still in development, and therefore potential impacts upon archaeological deposits, if present, cannot currently be determined in all cases. However, some areas of offline works have been scoped out of assessment. These include areas of existing hardstanding where no intrusive groundworks will take place, and areas where the construction or upgrade of elements such footpaths, fencing or shallow drainage works would result in superficial groundworks that will not affect deeper horizons with potential to contain archaeological remains.

5.2.12 Historic surfaces such as stone setts, as well as stone walls and gateposts may be affected by compound construction, equipment storage, vehicle collision and crushing beneath heavy vehicles.

5.2.13 The Code of Construction Practice (CoCP Part B) [**NR16**] supports the TWAO application and will be secured via planning condition. It outlines how Network Rail will manage construction impacts. The CoCP provides for a programme of archaeological work to secure mitigation commitments. This will identify the methodology for any investigation required. It will also set out control measures to enable the protection of areas of archaeological potential during construction works, and provisions for the investigation of any unexpected archaeological discoveries.

5.2.14 As the design of these elements progresses, further consultation will be undertaken with GMAAS to advise on design measures and construction controls to limit impacts, and to determine the scope and nature of any programme of archaeological work.

5.2.15 A summary assessment of offline areas of potential impact included within the TWAO is set out in Table 5-1, with more detailed assessment set out in Annex B.

Table 5-1 Summary of archaeology and built heritage potential of offline area of potential impact and likely mitigation works

Offline area of potential impact	Archaeological potential	Anticipated mitigation works
Printworks Work Main Compound, Millbrook	Relatively steep slope, medieval or post-medieval farming. Low potential for significant archaeological remains.	Depending on impacts, a staged programme of archaeological investigation may be required.
Printworks Office Compound, Millbrook	Ruins and buried remains of the medieval Souracre Farm, Woodfield. High potential for archaeological remains of low or medium significance.	Depending on impacts, historic building recording and a staged programme of archaeological investigation may be required.

Offline area of potential impact	Archaeological potential	Anticipated mitigation works
Heyrod Hall Compound	Archaeological remains relating to the development of Heyrod Hall in the medieval and post medieval period. Moderate potential for archaeological remains of low or medium significance.	Depending on impacts, a staged programme of archaeological investigation may be required.
Wakefield Road Compound, Millbrook	Former railway sidings. Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Scout Tunnel Site Compounds: Scout West Ramp and Laydown areas	Scout West Laydown: low potential for significant archaeological remains. Scout West Ramp: Low potential for archaeological remains of low or medium significance, associated with C18th and C19th Scout Mill, such as mill leats.	Scout West Laydown area: No archaeological mitigation works anticipated. Scout West Ramp Site: Depending on impacts, a staged programme of archaeological investigation may be required.
Manchester Road: Scout West Spoil Hold Site	Moderate potential for archaeological remains of demolished terraced housing of low significance. Low potential for archaeological remains of low or medium significance, associated with C18th and C19th Scout Mill, such as mill leats.	Depending on impacts, a staged programme of archaeological investigation may be required.
Scout East Ramp Works	Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Plevins Site Compound Works	Site was formerly used as Micklehurst Goods Station on the ‘Micklehurst Loop’, c. 1881-1966. The Goods Warehouse remains extant.	Depending on impacts, historic building recording and a staged programme of archaeological investigation may be required.
Egmont Street Compound	Buried remains of the C19th Albert Mill may survive beneath areas of modern hardstanding. Moderate potential for archaeological remains of low or medium significance.	Depending on impacts, a staged programme of archaeological investigation may be required.
Relocated Mossley Station West Site Compound	Formerly former railway sidings, signal posts, and allotment gardens. Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Mossley Station Relocation Works (Mossley Station Compound)	Formerly a railway siding with a coal depot. Non-listed ashlar gateposts and wall. Low potential for significant archaeological remains.	Historic building recording of surfaces, gateposts of boundary wall. Depending on impacts, a staged programme of archaeological investigation may be required.

Offline area of potential impact	Archaeological potential	Anticipated mitigation works
New Earth Street Compound	Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Roughtown Road Overbridge (MVL3/17) Works	Low potential for significant archaeological remains.	Roughtown Road Railway Overbridge (MVL3/17) will be protected via construction controls set out in the CoCP. No archaeological mitigation works anticipated.
Heron Lane Site Compound	Low potential for archaeological remains of low significance.	No archaeological mitigation works anticipated.
Armit Road Site Compound	Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Stockport Road Level Crossing Diversion	Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Royal George Underbridge (MVL3/25) and Compound Works	Former location of C19th Sunday School. Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Oaklands Road Site Compound Works	Former railway sidings. Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Greenfield Compound Works	Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Wickens Underbridge (MVL3/29) Laydown Area & Prow Upgrade	Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Former Saddleworth Station Site Compound	Previously used as a quarry. Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Brownhill Lane Access	Nearsite of Brown Hill Bronze Age barrow (1096.1.0) and 19th century quarrying. Low to moderate potential for prehistoric archaeology of low to medium significance, associated with Bronze Age or later burials	Depending on impacts, a staged programme of archaeological investigation may be required.
Old Railway Tunnel Compound,	Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.

Offline area of potential impact	Archaeological potential	Anticipated mitigation works
Saddleworth (Butterhouse Tunnel)		
Ward Lane Satellite Compound	Low potential for significant buried archaeological remains.	No archaeological mitigation works anticipated.
Grandpa Green Compounds 1 & 2	Low potential for significant archaeological remains.	No archaeological mitigation works anticipated.
Diggle Compound	Low potential for significant buried archaeological remains. Strengthening of south end of the Standedge Canal Tunnel (MVL3/39A) would not result in any alteration to the fabric of the portal.	No archaeological mitigation works anticipated.

Impacts on the setting of heritage assets

5.2.16 Construction of the Order Scheme is likely to have temporary impacts on the settings of surrounding heritage assets due to additional traffic, noise, dust, vibration and light emissions, particularly in more rural areas with open views and limited intervening vegetation or built screening.

5.2.17 Designated assets located directly outside of the Order Scheme boundary may be susceptible by the temporary impacts. These include 7,9, 11 and 11a Midge Hill (grade II, NHLE 1162827), 7, 9, 11 and 11a, Midge Hill (1162827); Christ Church, Friezland (1356701); and Huddersfield Narrow Canal, Lock no 23 (Lime Kiln Lock and adjoining tailbridge No 75 and Aqueduct No 74 (1356719). These impacts would cease at the end of the construction phase.

5.2.18 Construction would also result in temporary noise and visual intrusion on the setting of the Huddersfield Narrow Canal and heritage assets associated with it.

5.2.19 The Order Scheme involves upgrading a historic railway located in a landscape with areas of upland moorland, woodland flanking some parts of the railway, fields, small urban settlements and historic industrial areas in the Tame valley. The historic landscape character, which includes the course of the railway itself, will not alter significantly due to the Order Scheme.

5.2.20 No long-term or permanent impacts are predicted on the settings of designated or non-designated heritage assets from operation of the Order Scheme.

5.3 Mitigation Measures

5.3.1 Mitigation has been used in two separate ways: embedded mitigation and additional mitigation measures.

5.3.2 Embedded mitigation occurs within the design stage and is intended to include elements within the design that avoid or substantially reduce negative change to the significance of a historic asset. There may also be changes that enhance or improve a historic asset.

5.3.3 Embedded mitigation has been incorporated as an integral part of the design proposals for the designated online structures and includes measures such as:

- Use of natural stone masonry for new construction;
- Retention and reuse of historic fabric where possible;
- The use of a consistent design approach to masonry bridge reconstructions;
- Referencing existing architectural features in the design of the bridge reconstructions; and
- Use of natural stone copers to achieve required parapet heights for electrical protection works.

5.3.4 With regard to archaeological remains, the construction design for compounds, laydown areas, spoil area and haul roads will be finalised during the detailed design phase, after determination of the TWAO. Design mitigation measures, such careful siting, minimising land-take, utilising areas subject to previous ground disturbance, sensitive foundation design and drainage/utilities runs and applying construction methods that limit intrusive groundworks may be applied as part of this process to minimise the potential for impact on archaeological remains within areas of where potential for the presence of significant archaeological remains has been identified (Table 5-1 and Annex B).

5.3.5 Consultation will be undertaken with the Local Planning Authority Archaeological Adviser when details of construction methodologies for these areas are available to determine requirements for archaeological mitigation works.

5.3.6 It is anticipated that the design development process for the Order Scheme would identify further mitigation measures. Network Rail commits to undertaking such additional mitigation measures as part of the implementation of the construction of the Order Scheme in compliance with legislation and NR/L2/ENV/015, Volume 3, Appendix 1A of this Report [**NR14**]. For archaeological remains, it is anticipated that most work would take place within the site setup and initiation clearance phase of work. Investigations may include:

- Targeted excavation;
- Watching brief on groundworks; and
- Construction controls such as protection of any remains preserved in situ.

5.3.7 These works would be secured through Section 5 of the Code of Construction Practice (CoCP) Part B and an associated planning condition attached to the deemed planning permission applicable to the relevant works elements of the Order Scheme.

5.3.8 For designated and non-designated online structures impacted by the Order Scheme, historic building recording would be undertaken in accordance with guidance published by Historic England, Understanding Historic Buildings: A Guide to Good Recording Practice (Historic England 2016). This sets out four main levels of record:

- Level 1: Basic visual record, typically consisting of photography, a brief written account, and sketches. Generally of exteriors only.
- Level 2: Descriptive record analysing its development and use. Both the exterior and interior of the building will be seen, described and photographed.
- Level 3: Analytical record of the evolution and change a building has undergone, including a systematic account of the building's origins, development and use. Supported by all drawn and photographic records that may be required to illustrate the building's appearance and structure and to support an historical analysis.
- Level 4: Comprehensive analytical record of a building, a full historical and architectural analysis, supported by a comprehensive drawn and photographic record.

5.3.9 Historic building recording would provide a permanent documentary record of the structures in their current condition which would be submitted to the Greater Manchester Historic Environment Record. Based on the works proposed to a number of structures by the Order Scheme, the proposed levels of recording for each structure is identified in Table 5-2 below:

Table 5-2 Proposed additional mitigation for designated and non-designated built heritage assets

NHLE reference	Asset	Name	Designation	Historic Building Record
1449242	MVL3/7	Heyrod Hall Overbridge	Grade II listed building	Level 3
1452382	MVL3/8	Springbank Footbridge	Grade II listed building	Level 1

1449241	MVL3/9	Springbank Lane Overbridge	Grade II listed building	Level 1
N/A	MVL3/10A	Manchester Road Footbridge	None	Level 1
1452392	MVL3/10	Manchester Road Underbridge	Grade II listed building	Level 1
1452405	MVL3/17	Roughtown Road Overbridge	Grade II listed building	Level 1
1452406	MVL3/20	Wright's Mill Overbridge	Grade II listed building	Level 3
1452409	MVL3/23	Wright's Overbridge	Grade II listed building	Level 3
1451848	MVL3/25	Royal George Underbridge	Grade II listed building	Level 3
1451852	MVL3/26	Shaw Hall Bank Road Footway	Grade II listed building	Level 1
1451853	MVL3/28	Oldham Road Overbridge	Grade II listed building	Level 3
1451854	MVL3/29	Wickens Underbridge	Grade II listed building	Level 1
1068120	MVL3/31	Uppermill Viaduct	Grade II listed building	Level 1

5.3.10 A scheme of permanent heritage interpretation would be developed and installed adjacent to Greenfield Station. This would provide the opportunity to engage members of the public with the heritage of the Huddersfield & Manchester Railway including the historic structures designed by A. S. Jee. Further engagement with stakeholders with respect to the content of the interpretation would be undertaken during the detailed design phase.

5.3.11 A public engagement framework for archaeology and heritage will be developed and implemented as part of the project's wider commitment to delivering social value. This framework will create meaningful opportunities for communities to actively engage with the rich archaeological and historical narrative of the Transpennine Route. It will foster connections between people and the evolving landscape of the Tame Valley, helping to reveal and celebrate its past through inclusive, accessible, and educational initiatives.

5.3.12 Temporary interpretation would also be installed on the hoardings around construction sites for the Order Scheme which would be in place during the construction phase.

5.3.13 Toolbox talks would disseminate best practice for reducing potential impacts in relation to construction activity to help avoid accidental damage.

6. CONCLUSIONS

6.1.1 This Historic Environment Desk-Based Assessment has identified impacts on a number of designated and non-designated heritage assets from the Order Scheme. These include listed buildings, conservation areas, non-designated historic structures and archaeological remains.

6.1.2 Listed building consent will be required for proposed works to twelve designated online structures comprising grade II listed railway bridges dating to the 19th century. Full details of the proposed alterations and the resulting impacts to these heritage assets are set out in the heritage statements prepared to accompany the listed building consent applications (Volume 3, Appendix 5A of this Report [**NR14**]).

6.1.3 Construction of the Order Scheme would result in impacts to non-designated online structures comprising altered railway bridges dating from the 19th century. Historic building recording in accordance with Historic England guidance is recommended to be undertaken to provide a permanent record of these structures in advance of the construction.

6.1.4 Construction of the Order Scheme has the potential to truncate or remove buried archaeological remains as a result of intrusive groundworks. Impacts may also occur to historic structures, surfaces, gate piers and stone walls as a result of construction works.

6.1.5 Further consultation will be undertaken with consultees including the Local Planning Authority Archaeological Adviser when detailed design information is available to determine any requirement for archaeological mitigation in areas where there is potential for archaeological remains to be present

6.1.6 In addition, a programme of heritage interpretation at Greenfield Station, alongside a wider public engagement framework, will offer opportunities for the public to engage with the heritage of the Huddersfield & Manchester Railway, and to explore the history and archaeology of the Tame Valley.

ANNEX A – GAZETTEER OF HERITAGE ASSETS

A.1 Online Designated Heritage Assets

NR Reference	NHLE Reference	Easting	Northing	Designation	Name	Description	Period
MVL3/7	1449242	397200	399786	Grade II Listed Building	Heyrod Hall Bridge	Road bridge over the Huddersfield & Manchester Railway line, mid-late 1840s, by A S Jee. Rock-faced sandstone with ashlar dressings.	Post-Medieval
MVL3/8	1452382	397333	400119	Grade II Listed Building	Railway overbridge MVL3/8, Heyrod Footbridge	Railway overbridge and flight of steps, 1845-1849, with later parapets, by AS Jee for the Huddersfield & Manchester Railway.	Post-Medieval
MVL3/9	1449241	397325	400199	Grade II Listed Building	Heyrod Bridge	Road bridge over the Huddersfield & Manchester Railway line, mid-late 1840s, by A S Jee.	Post-Medieval
MVL3/10	1452392	397306	400477	Grade II Listed Building	Railway underbridge MVL3/10, Manchester Road	Railway underbridge, 1845-1849, by AS Jee for the Huddersfield & Manchester railway.	Post-Medieval
MVL3/11	1452399	397291	401240	Grade II Listed Building	Railway tunnel portal, MVL3/11 Scout Tunnel (south end)	Railway tunnel portal, 1845-1849, by AS Jee for the Huddersfield & Manchester Railway.	Post-Medieval
MVL3/17	1452405	397723	402833	Grade II Listed Building	Railway overbridge MVL3/17, Roughtown Road	Railway overbridge, 1845-1849, by AS Jee for the Huddersfield & Manchester railway.	Post-Medieval
MVL3/20	1452406	397859	403652	Grade II Listed Building	Railway overbridge MVL3/20, Wright's Mill	Railway overbridge, 1845-1849, by AS Jee for the Huddersfield & Manchester Railway.	Post-Medieval
MVL3/23	1452409	398107	404133	Grade II Listed Building	Railway overbridge MVL3/23, Wright's	Railway overbridge, 1845-1849, by AS Jee for the Huddersfield & Manchester Railway.	Post-Medieval
MVL3/25	1451848	398598	404393	Grade II Listed Building	Royal George Underbridge	Railway underbridge for the Huddersfield & Manchester Railway. Mid-late 1840s by A S Jee.	Post-Medieval
MVL3/26	1451852	398942	404525	Grade II Listed Building	Railway accommodation underbridge MVL3/26, Footway	Accommodation underbridge for the Huddersfield & Manchester Railway. Mid-late 1840s for the railway line with A S Jee as lead engineer.	Post-Medieval
MVL3/28	1451853	399202	404728	Grade II Listed Building	Railway overbridge MVL3/28, Oldham Road	Railway overbridge for the Huddersfield & Manchester Railway. Mid-late 1840s by A S Jee.	Post-Medieval
MVL3/29	1451854	399465	405409	Grade II Listed Building	Railway accommodation underbridge MVL3/29, Wickens	Accommodation underbridge for the Huddersfield & Manchester Railway. Mid-late 1840s by A S Jee.	Post-Medieval
MVL3/31	1068120	399578	406310	Grade II Listed Building	Uppermill Viaduct	Railway viaduct. 1849. By AS Jee Huddersfield and Manchester Railway Co. Rock-faced stone. Total of 23 arches.	Post-Medieval
MVL3/40	1224282	403928	411860	Grade II Listed Building	Railway tunnel portals MVL3/40, east end of Standedge Tunnel	Three railway tunnel portals at the east end of Standedge Tunnel; the centre portal built in 1845-1849 by the contractor Thomas Nicholson and engineer Alfred Stanistreet Jee for the Huddersfield & Manchester Railway line, the south portal built at the same time, in advance of a tunnel excavated in 1868-1871, and the north portal built in 1890-1894 for the London & North Western Railway.	Post-Medieval
MVL3/41	1452141	400777	408129	Grade II Listed Building	Railway tunnel portals MVL3/41, west end of Standedge Tunnel	Three railway tunnel portals at the west end of Standedge Tunnel; the centre portal built in 1845-1849 by the contractor Thomas Nicholson and engineer Alfred Stanistreet Jee for the Huddersfield & Manchester Railway line, the south portal built at the same time, in advance of a tunnel excavated in 1868-1871, and the north portal built in 1890-1894 for the London & North Western Railway.	Post-Medieval

A.2 Online Non-Designated Heritage Assets

Reference	Easting	Northing	Name	Description	Period
MVL3/5	396943	399360	Printworks Road Underbridge	Underbridge constructed for the Huddersfield & Manchester Railway (1845-1849). Barrel arched, in rock faced masonry with raked wing walls extend straight along railway embankment to either side to terminate in piers. Impost band and ashlar parapet band over, with later stone parapets above.	Huddersfield & Manchester Railway (1845-9)
MVL3/6	397132	399687	Heyrod Road Footbridge	This footbridge may have been built during the construction of the Huddersfield & Manchester Railway (1845-9) with piers of squared and coursed quarry-faced stone, but it was reconstructed in 2004 and now has a steel span	Huddersfield & Manchester Railway (1845-9) / 2004
MVL3/10A	397250	400698	Manchester Road Footbridge	This is a two-span footbridge with a central engineering brick pier supporting a single riveted wrought iron deck with lattice girder parapets and a timber deck. At the west end it meets the side of the cutting; at the east end there is a set of stairs with decorative cast-iron balusters. From historic drawings, it appears the footbridge was erected by the LNWR between 1898 and 1900 to enable a level crossing to be closed. At that time there was a siding west of the two running lines, which explains the wide span.	1898-1900 (LNWR)
MVL3/11	397271	401179	Scout Tunnel	Scout Tunnel is situated between Stalybridge Station and Mossley Station and is 202 yards (185m) long. The tunnel was constructed by the Huddersfield & Manchester Railway (1845-49) under engineer A.S. Jee. The north portal is faced in coursed and square, however is much simpler than the southern portal (grade II, 1452399). The parapet on the northern portal collapsed in December 2012 and has since been stabilised and rebuilt in concrete.	Huddersfield & Manchester Railway (1845-9)
MVL3/12	397284	400590	Abney Footbridge	This footbridge was built during the construction of the Huddersfield & Manchester Railway (1845-9) from squared and coursed quarry-faced stone, but has been reconstructed in 2008 and now has a steel span.	Huddersfield & Manchester Railway (1845-9) / 2008
MVL3/12A	397352	402003	Stamford Road Pipebridge	A pipe-bridge supported on masonry abutments, thought to date to c.1900.	c.1900
MVL3/13	397352	402003	Stamford Road Overbridge	Stamford Bridge is a stone overbridge which was constructed for the Huddersfield & Manchester Railway (1845-9), which has been altered significantly by the postwar substitution of a pre-cast concrete span.	Huddersfield & Manchester Railway (1845-9) / 20th century
MVL3/14	397363	402003	Mossley Station Footbridge	Mossley Station Footbridge is a single span footbridge consisting of two wrought iron warren trusses with cross beams and timber decking. The detailing is extremely utilitarian. This footbridge is a typical and utilitarian structure of unknown but not early date.	Unknown
MVL3/15	397469	402558	Mill Lane Underbridge	Mill Lane is a stone semi-circular arch underbridge constructed for the Huddersfield & Manchester Railway (1845-9). Both faces are similar. Designed by A.S. Jee, the bridge has a semi-circular arch of rusticated v-jointed gritstone voussoirs which continue as quoins to the soffit. These have tooled margins, and spring from an ashlar impost band. The projecting wing walls are raked, and these and the spandrels are of squared and coursed quarry-faced limestone. The arch is topped by a squared ashlar string course, above which is several courses of masonry, and squared ashlar coping. The arch soffit is comprised of narrow courses of masonry, with tooled detailing. Twentieth-century additions of a concrete parapet and safety railings feature on both sides. Mill Lane has good quality stonework and dates to the heroic phase of railway development, but its design is unexceptional and it has been altered.	Huddersfield & Manchester Railway (1845-9) / 20th century
MVL3/16	397600	402700	New Earth Footbridge	Mill Lane is a footbridge with riveted wrought iron girders spanning the railway, which rest on masonry abutments and dates to the construction of the Huddersfield & Manchester Railway (1845-9). The bridge started life as a stone segmental overbridge, similar to others on the line, but was reconstructed in 1884 by London & North Western Railway and the span was replaced in wrought iron.	Huddersfield & Manchester Railway (1845-9) / 1884
MVL3/18	397760	402890	Roughtown Road Footbridge	This is a footbridge with riveted wrought iron girders with cross-braced panels spanning the railway, which rest on masonry abutments and date to the construction of the Huddersfield & Manchester Railway (1845-9). The bridge started life as a stone segmental overbridge, similar to others on the line, but was reconstructed in 1896 by the London & North Western Railway and the span was replaced in wrought iron.	Huddersfield & Manchester Railway (1845-9) / 1896
MVL3/19	397851	403403	Midge Hall Underbridge	Midge Hall is a semi-circular arch underbridge, on the Huddersfield & Manchester Railway (1845-9). The arch is of stepped, rusticated quarry-faced voussoirs with a continuous tooled margin and springs from an ashlar impost band. The soffit has been line in concrete. The quoins to the abutments are quarry-faced with a tooled margin to each block. The spandrels are of squared and coursed quarryfaced sandstone. The straight wing walls are raked and splayed, with a squared ashlar coping. The parapet is of squared ashlar topped by C20 railings, with square terminating piers.	Huddersfield & Manchester Railway (1845-9) / 20th century

Reference	Easting	Northing	Name	Description	Period
				Although this bridge has good quality stonework and dates to the heroic phase of railway development, the arch has been unsympathetically reinforced in concrete and the design type and engineering are commonplace for the date.	
MVL3/21	397878	403738	Water Trough	A water trough supported on masonry abutments, thought to date to c.1900. The span was replaced c.2005 with a steel replacement.	London & North Western Railway c.1900 / 2005
MVL3/22	398191	404111	Hobbe Hole Underbridge	Hobble Hole Underbridge is shown on Historic Map published in 1854, and is likely to be contemporaneous with the Huddersfield & Manchester Railway. The bridge has been subject to works since to the underside of the arch.	Huddersfield & Manchester Railway (1845-9)
MVL3/24	398296	404269	Charlotte Street Underbridge	Charlotte Street is a single-span underbridge carrying the railway over a small road. It was constructed for the Huddersfield & Manchester Railway (1845-9), but significantly altered in the late twentieth century, when the span was removed and replaced with reinforced concrete deck beams.	Huddersfield & Manchester Railway (1845-9) / late 20th century
MVL3/27A	399189	404712	Greenfield Station Footbridge	Greenfield Station Footbridge is a riveted wrought iron footbridge with cross bracing, lattice girders and a timber deck. This footbridge is likely to date to c.1900, and would have been built by the London & North Western Railway . The footbridge was moved to Greenfield Station in the late 20th century when some of the balusters were reinstated in fibreglass.	London & North Western Railway c.1900 / 20th century
MVL3/30	399648	406475	Den Quarry Underbridge	Den Quarry is a segmental skewed accommodation underbridge, on the Huddersfield & Manchester Railway (1845-9). The arch is of stepped, rusticated quarry-faced voussoirs with a continuous tooled margin to the ring of the arch. It springs from an ashlar impost band. The bridge has been extended, during the widening of the line by the London & North Western Railway (c.1900). The soffit is of stone, but has been partially recovered with Armco sheeting. The quoins to the abutments are quarry-faced with a tooled margin to each block. The spandrels are of squared and coursed quarry-faced sandstone. The straight wing walls are raked and splayed, with a squared ashlar coping, and the bridge accommodates a steep change of level. Although this bridge has good quality stonework and dates to the heroic phase of railway development, the arch has been unsympathetically reinforced in concrete.	Huddersfield & Manchester Railway (1845-9) / 1900
MVL3/32	400300	407100	Subway	This is a underbridge for a footpath which appears to have been completely refaced in engineering brick, which is likely to date to the quadrupling of the line, c.1890.	Huddersfield & Manchester Railway (1845-9) / 1890
MVL3/34	400262	407272	Subway	This is a stone subway which has been widened with engineering brick. It is likely to date to the construction of the Huddersfield & Manchester Railway (1845-9), but has been significantly altered which is likely to date to the quadrupling of the line, c.1890.	Huddersfield & Manchester Railway (1845-9) /1890
MVL3/36	400339	407530	Ward Lane Overbridge	Ward Lane Overbridge is a single span footbridge comprising two cast iron girders with a brick jack arch spanning between the girder bottom flanges. The parapets are of iron panels. The deck spans between stone abutments of squared and coursed quarry-faced stone. The wing walls and approach walls are of quarry-faced stone construction and may date to the construction of the Huddersfield & Manchester Railway (1845-9).	Huddersfield & Manchester Railway (1845-9)
MVL3/37	400495	407779	Diggle Brook	This is a underbridge carrying the railway over Diggle Brook. Each side is different, with one brick arch and one quarry-faced stone, and it is likely that the bridge has been extended during the quadrupling of the line (1888-91).	Huddersfield & Manchester Railway (1845-9) / 1888-91
MVL3/39	400720	408050	Station Road Overbridge	Diggle Road is a three-span road bridge carrying Station Road over the two rails of the MVL3 line. The two tracks run beneath the Western span, and beneath the central span is an access track leading to two disused portals of Standedge Tunnel.	Huddersfield & Manchester Railway (1845-9)
MVL3/39A	400824	408222	Standedge Canal Tunnel	The structure is a single-span underbridge carrying three lines (Huddersfield & Manchester Railway, 1845-9, and a later siding) over the Huddersfield Narrow Canal. The structure consists of a brickwork arch on the downside for an approximate length of 95m, followed by concrete deck beams. The concrete section is owned by Network Rail, and the remainder is owned and maintained by the Canals & Rivers Trust.	Huddersfield & Manchester Railway (1845-9)
18983.1.0	400390	407630	Diggle Signal Box	Diggle Junction Signal Box, originally Diggle No1 signal box, opened in 1885 near the western portal of the Standedge Tunnels. It was equipped with 59 levers and was extended to 81 levers in 1891 on closure of Diggle No2 signal box near the station. Initially it controlled traffic on one down line (away from London) and one up line. Second lines were added in 1886 when the Micklehurst loop line from Stalybridge was opened. The signal box also controlled a single line that served the Dobcross Loom Works, which had their own engine 'The Foundry Rocket.' The building is a good example of a large London & North Western Railway Type 4 signal box, comprising a timber-framed box mounted on a brick base. It features a slate-covered gabled roof, introduced by the LNWR in 1876.	Later 19th century

A.3 Offline Designated Heritage Assets

NHLE / GMHER Ref	Easting	Northing	Designation	Name	Description	Period
1005797	402873	412099	Scheduled Monument	Close Gate Bridge	No entry available for this asset	Post-Medieval
1011681	398013	407461	Scheduled Monument	Bowl barrow 190m NNE of Knarr Barn	The monument includes a bowl barrow located on a local high point 190m NNE of Knarr Barn. It includes a slightly oval earthen mound up to 0.5m high with maximum dimensions of 18m by 17m. Limited excavation of the barrow by Wrigley in 1911 located pieces of charcoal and fragments of burnt stone. The monument was again subjected to limited excavation during the 1980s; on this occasion the topsoil only was removed from a single trench. No finds were recorded.	Prehistoric
1015131	398905	401634	Scheduled Monument	Buckton Castle: a ringwork and site of 17th century beacon 350m north east of Castle Farm	The monument includes a medieval ringwork castle and the remains of a bailey on the northern side. The monument is on a shoulder of Buckton Moor commanding a view of the valleys of the River Tame and the Carr Brook where they meet. The ringwork is constructed as a raised platform measuring 35m by 40m and is roughly rectangular. The site is enclosed by a bank which is in fact a collapsed wall of mortared blocks of stone with a mortared rubble core.	Medieval
1017837	399838	409547	Scheduled Monument	Castleshaw Roman forts, 250m west of Castle Shaw Farm	A sequence of Roman forts at Castle Shaw, together with the remains of a settlement outside the ramparts of the forts and a section of Roman road leading to the forts from the south west. The forts and the remains of a civilian settlement have been extensively excavated over the last 100 years.	Roman
1338882	396125	398463	Grade II Listed Building	Castle Street Mills	Marked on maps (1,2) as a cotton mill and as a cotton waste mill on map (3). Spinning mill No.1: "1820" datestone, brick build, of 4 storeys and 23x4 bays. Gable slate roof.	Post-Medieval
1162957	396259	398964	Grade II Listed Building	Church of St George	Church, 1838–40, built by Sharpe for the church commissioners. Nave and aisles under one roof with small chancel and west tower. 7-bay aisles and 1-bay chancel, 3-stage tower and a clock, aperture in stage two.	Post-Medieval
1240077	396265	398636	Grade II Listed Building	Thorn House	Electricity generating company offices and generating station. 1903–04 with C20 alterations.	Modern
1261179	396331	398527	Grade II Listed Building	Former Sunday School	Sunday school with facilities for adult classes. 1904-5. The school collaborated with the Mechanics' Institute and adult classes were addressed by various notable figures; John Bright endowed the library.	Modern
1067987	396350	398593	Grade II Listed Building	Portico of Former Stalybridge Town Hall	Portico arch, formerly the entrance portico to the former town hall of 1831, modified in the late 1980s.	Post-Medieval
1163074	396354	398554	Grade II* Listed Building	War Memorial	War memorial, c.1920, FV Blundstone, sculptor. Bronze statuary group on ashlar plinths. Walls which are segmental in plan are terminated on either side of Trinity Street in piers with statues	Modern
1356470	396357	398540	Grade II Listed Building	Victoria Bridge	Road bridge, date 1867. 2 wrought iron girders spans on central rock-faced stone pier with cast iron parapet walls.	Post-Medieval
1389352	396371	398527	Grade II Listed Building	Post Office on Trinity Street, Stalybridge	This building, which opened in 1901, illustrates the use of architectural embellishment for the larger post offices.	Post-Medieval
1356492	396382	398506	Grade II Listed Building	Stalybridge Public Library	Public library built 1897–1901, by J Medland Taylor. Total of 6 bays; 2 storeys, tile roof.	Post-Medieval
1346235	396627	398562	Grade II Listed Building	18, 20 and 22, Portland Place	Terrace of houses. Early C19 (pre-1840). Rubble, coursed to front; stone slab roof. 3 storeys.	Post-Medieval
1261184	396780	398719	Grade II Listed Building	Huddersfield Narrow Canal, Milestone set in boundary wall at SJ 968 988	Milestone. 1794–97. Rectangular stone post with curved head, round indented face with the inscription "18 miles"	Post-Medieval
1067986	396978	399556	Grade II Listed Building	Toll Bar Cottage	Toll bar cottage, c.1800. 1 x 2 rooms deep with 1 storey (2 at the rear), gable onto road and C20 additions to left. The central door has a pointed arch, fanlight and square-cut stone surround.	Post-Medieval
1356467	397139	400089	Grade II Listed Building	Moorfield House	3-storey house and a 2-storey extension to left, late C18. Central square-cut door surround obscured by C20 porch. The extension to left is in a similar style.	Post-Medieval

NHLE / GMHER Ref	Easting	Northing	Designation	Name	Description	Period
1162781	397240	402718	Grade II Listed Building	Number 18 and adjoining cottages 1 and 3, Carrhill Road	House and 2 cottages with workshop on top floor, formerly used as a school. Late 18th century. Double-depth 1-bay house to right, back-to-back cottages to left. Second storey is a single workshop with separate access at the rear, which has a flight of stone steps giving access. One brick and one stone ridge chimney stacks.	Post-Medieval
1163008	397250	400161	Grade II Listed Building	14, 16, and 18, John Street	3 houses. Nos.14 and 16 are dated 1788 on door lintels, and No.18 dated 1796. Double-depth, 3-storey with a 2-storey C20 garage extension recessed to the left of No.18. Each house has a square-cut stone door surround.	Post-Medieval
1068044	397280	402049	Grade II Listed Building	Former Mossley Town Hall	Town hall, originally private house, 1862. Large asymmetrical plan of 8 bays and 2 storeys executed in an Italianate style.	Post-Medieval
1309347	397282	400166	Grade II Listed Building	Holly Cottage	2 houses, late C18. Each house is double-depth and has 3 storeys.	Post-Medieval
1162871	397299	402050	Grade II Listed Building	War Memorial in Front of Former Town Hall	War Memorial circa 1920. Marble statue on polished granite base. Robed female figure holding a book in one hand standing on a tapering square stone plinth. Inscription: "Erected on behalf of the town by Alderman and Mrs. J. A. Bottomley". Surrounded by plain iron railings.	Modern
1162961	397340	401023	Grade II Listed Building	Scout Tunnel South Entrance	Tunnel entrance built between 1794 and 1797. Engineer Benjamin Outram; elliptical arch retaining wall which is curved and has square terminating piers.	Post-Medieval
1309457	397464	401161	Grade II Listed Building	Huddersfield Narrow Canal Scout Tunnel North Entrance	Tunnel entrance built 1794–97. Benjamin Outram engineer. Skew bridge, elliptical arch and curved parapet walls which have round-topped coping stones and are terminated in battered square piers.	Post-Medieval
1261183	397485	400480	Grade II Listed Building	Huddersfield Narrow Canal, Black Rock Bridge at SD 976 004	Accommodation bridge at the tail of lock 10W. 1795–98. Humpbacked bridge of rustic coursed stone.	Post-Medieval
1162836	397558	402943	Grade II Listed Building	1, Quickwood	Early C19. 2-storey house, formerly schoolmaster's house. Graduated slate roof with central door and square-cut surround.	Post-Medieval
1068041	397564	402939	Grade II Listed Building	Garden Wall to Numbers 3, 4, 5 and 6 Manor House	4 houses, formerly the manor house with two cottages at rear, late C17, extended to the rear in C19.	Post-Medieval
1309435	397586	402932	Grade II Listed Building	2; 7-17 Quickwood	7 cottages, various dates from early 18th-century to early 19th-century. Formerly a terrace of 2-storey single-depth cottages, but extended at the rear in the 19th century, probably when No.2 was built.	Post-Medieval
1356439	397615	402994	Grade II Listed Building	Church of St John The Baptist	Church: 1878–79 (Wild and Collins). Rock-faced stone with slate roof. Nave and chancel under one roof with south aisle. South-west tower, 3-stage with east door. Twin-gabled vestry	Post-Medieval
1356441	397622	402199	Grade II Listed Building	Huddersfield Narrow Canal Micklehurst Bridge and Lock Number W13	Lock and tail bridge. Between 1794 and 1797. Benjamin Outram engineer. Hammer-dressed stone.	Post-Medieval
1162773	397646	401908	Grade II Listed Building	Inglenook	2 houses, formerly three cottages. Built during the late 17th, early 18th, and mid-18th centuries. 2 storeys, long single-depth, incorporating a barn in bay 1 (Now part of the house).	Post-Medieval
1068042	397661	402838	Grade II Listed Building	Summerhill Cottage	2-storey house, mid-18th century. 2 bays, 1-room depth with central door, square-cut surround. 2 brick chimney stacks, chamfered floor beams.	Post-Medieval
1162827	397686	403564	Grade II Listed Building	7, 9, 11 and 11a, Midge Hill	3 houses and a flat, mid- to late 18th century. Each house is double depth with 3 storeys, totalling 8 bays in length. Doors at rear give access to the top storeys of Nos.11a and 9 and a taking-in door with square-cut surround. Venetian type attic window.	Post-Medieval
1068037	397703	402559	Grade II Listed Building	Huddersfield Narrow Canal Winterford Bridge and Lock Number W14	Lock and adjoining roving bridge, built between 1794 and 1797. Benjamin Outram engineer.	Post-Medieval
1268030	397734	402621	Grade II Listed Building	Woodend Mill	Marked on maps (1,2) as a cotton mill. A very large site. The spinning mill is early to mid-C19, of 5 storeys (plus basement) and 18x5 bays. It is built of rustic stone with brick internal structure. Gable roof.	Post-Medieval

NHLE / GMHER Ref	Easting	Northing	Designation	Name	Description	Period
1356440	397748	402909	Grade II Listed Building	32 and 34, Greenhill Cottages	Two houses, dating from the late C18. Each house is 1 bay wide, of double depth and of 3 storeys.	Post-Medieval
1068038	397766	402774	Grade II Listed Building	Woodend Toll Bar Cottage	Former early 19th-century toll bar cottage.	Post-Medieval
1240125	397969	402939	Grade II Listed Building	Huddersfield Narrow Canal, Milestone at SD 979 030	Milestone. 1794–97. Rectangular stone post with curved head, round indented face with the inscription "15 miles".	Post-Medieval
1309462	398096	403693	Grade II Listed Building	Huddersfield Narrow Canal Division Bridge	Roving bridge, built between 1794 and 1797. Benjamin Outram engineer. Skew bridge, elliptical arch and curved parapet walls, which have round-topped coping stones	Post-Medieval
1067432	398128	403774	Grade II Listed Building	Huddersfield Narrow Canal No. 84 Aqueduct	Aqueduct over the river Tame. "1797 IW" carved on stone. Benjamin Outram engineer.	Post-Medieval
1356714	398186	404438	Grade II Listed Building	Throstle Nest Mill (former)	Water-powered scribbling and spinning mill, now a house. 1791 for Henry Buckley.	Post-Medieval
1390053	398319	404111	Grade II Listed Building	The Royal George Canal Bridge	Canal bridge. 1798 with later widening, associated with the Huddersfield Narrow Canal. Possibly by Benjamin Outram, engineer.	Post-Medieval
1309579	398458	404280	Grade II Listed Building	Christ Church Vicarage	c.1850. By G Shaw. Snecked stone with decorative clay tile roof. 4 bays and 2 storeys. Gothic revival.	Post-Medieval
1356701	398508	404320	Grade II Listed Building	Christ Church, Friezland	c.1850 with additions of 1860s. By George Shaw. Snecked stone with slate roof. Nave and chancel with north-west tower, south transept, north aisle, organ chamber and vestry, all of later date. Gothic revival.	Post-Medieval
1253529	398609	404251	Grade II Listed Building	Huddersfield Narrow Canal Milestone at SD 987 043	Milestone. 1794–97. Rectangular stone post with curved head, round indented face with the inscription "14 miles".	Post-Medieval
1068153	399013	404670	Grade II Listed Building	Wharmton Tower	House. c.1861. By George Shaw for John Dicken Whitehead. Ashlar with slate roof. 8 bays with 2 and 3 storeys and conservatory to right.	Post-Medieval
1067470	399195	404617	Grade II Listed Building	Wharf Cottages	3 houses. Mid- and late C18 and mid-C19 but incorporating a house of early C18. Watershot hammer-dressed stone with graduated stone slate roof	Post-Medieval
1068147	399349	406509	Grade II Listed Building	Lower Cottage	Hammer-dressed stone house with graduated stone slate roof. 17th century but with later addition dated "IWAW 1742" on lintel. Two storeys. Two ridge chimney stacks	Post-Medieval
1068187	399351	406519	Grade II Listed Building	Hillcot	Early/ mid-18th century hammer-dressed watershot stone house with graduated stone slate roof. 2 storeys.	Post-Medieval
1163751	399371	406505	Grade II Listed Building	Hillside Cottage	Hammer-dressed watershot stone house with graduated stone slate roof and "W H 1765" datestone. Two storeys.	Post-Medieval
1067469	399375	404568	Grade II Listed Building	Toll House	Toll cottage, now house. c.1820. Watershot hammer-dressed stone with graduated slate roof and an extension in rendered brick. On branch of Oldham–Standedge Turnpike. Single storey, Gothic windows, central chimney.	Post-Medieval

CA12 DGM3166	339701	405900	Conservation Area	Uppermill, Saddleworth	Designated a conservation area in 1977, Uppermill is a Saddleworth village characterised by its 19th-century industrial origins and largely intact domestic stone-built architecture. The village developed around the textile industry, utilising the River Tame for power, and features mills, residential areas, and public buildings aligned along the High Street. Key historical infrastructure includes the Huddersfield Narrow Canal, completed in 1811, and the 1849 railway viaduct. The conservation area preserves the 19th-century village core, with its natural stone buildings, while excluding later suburban expansion.	Post-Medieval
DGM2201	396335	398538	Conservation Area	Stalybridge Town Centre	Stalybridge town centre, designated a conservation area in 1991, reflects its 19th-century growth as a mill town shaped by the cotton industry, the River Tame, and the Huddersfield Narrow Canal. Its built environment, largely constructed from local stone, includes industrial and domestic buildings along streets like Market, Melbourne, and Grosvenor, which follow the valley contours and integrate with the Pennine landscape. While the area retains its historic character, challenges such as economic decline, modern alterations, and street clutter have led to its inclusion on the ‘At Risk’ Register. A Heritage Action Zone (2020–2024) aims to address these issues through restoration projects and heritage-focused initiatives.	Post-Medieval

NHLE / GMHER Ref	Easting	Northing	Designation	Name	Description	Period
CA02 DGM3168	399200	406587	Conservation Area	Dobcross	Dobcross was designated a Conservation Area in 1972, and extends over an area of 5.74 hectares. The settlement of Dobcross lies on a moderately sloping site to the west of the A670 (Wool Road), between the villages of Uppermill and Diggle. To the south are the River Tame and Dobcross New Road (A6052), which links the A670 with the A62 in Delph. To the north the land rises up to Harrop Edge and the Pennine Moors beyond. Prior to the Industrial Revolution Dobcross was a small hamlet on one of the main packhorse routes over the Standedge Moors. The origin of the name Dobcross is somewhat obscure, although it is thought that it could be derived from the situation of the settlement at a point where ancient trans-Pennine routes met to cross the marshy land of the Tame Valley. With the increase in trade and communication Dobcross began to grow around a natural route junction at the confluence of the two valleys of the River Tame and the Diggle Brook, until by 1800 it was the main commercial centre of Saddleworth. At this time the textile industry was in the process of transformation, with domestic workshops giving way to large factories, the looms being mainly driven by water power. Evidence of the earlier domestic handloom textile industry is provided by the large strip windows at first and second floor levels in the earlier dwellings. To the east of the original settlement between Sugar Lane and Sandy Lane are the more recent council estates of Briarfield and Southgate, while to the west is the Nudger Green private housing estate. The settlement form follows the traditional Pennine moorland pattern with the buildings clustered closely together along the narrow roadways. Towards the centre the positioning of the buildings is such as to create a series of irregularly shaped squares linked by narrow roadways and passages. This, together with the somewhat oddly shaped buildings and different roof heights etc., emphasises the organic growth of the settlement and reflects the close-knit community living around which it was built. The layout is basically introspective with unexpected corners and rapid changes in level providing interesting vistas with occasional dramatic long-distance views between buildings, to Ladcastle and across the Tame Valley. The square in the centre of the settlement, although surrounded by attractive buildings, is dominated by the Ramsden Memorial, erected in 1901 in memory of Dr. WHF Ramsden, the local country doctor. Another interesting building is the Church of the Holy Trinity, built in the Italian Style in the 1780s. Walls in the settlement are of local gritstone, blackened by the atmospheric pollution of the Industrial Revolution, with long and short stonework at the corners and door openings. Roofs are of grey stone slate laid to a shallow pitch. Windows are basically of the mullion type and the general absence of timber features on the buildings emphasises the attention paid to the rigours of the climate.	Post-Medieval
CA03 DGM3171	400591	408155	Conservation Area	Harrop Green	Harrop Green was designated a Conservation Area in 1972 and extends over an area of 0.78 Hectares. Harrop Green is a physically distinct hamlet to the north west of Diggle Village. The Diggle Brook flows along the valley to the south to join the River Tame between the villages of Uppermill and Dobcross. To the north of the settlement marginal agricultural land sweeps up to merge into the Pennine Moors while to the east is the bleak Pennine section of the Peak District National Park. Most of the buildings date back to the 18th Century although it is thought that some may be considerably older. Originally Harrop Green and the neighbouring conservation area of Diglea were small farming hamlets clustered around route junctions but the large strip windows at first and second floor levels provide evidence of the hand loom textile industry. The route pattern was radically altered and the hamlets physically separated by the construction of the Huddersfield Narrow Canal and the later Trans-Pennine railway line which enters the Standedge tunnels at this point. The settlement form of Harrop Green follows the traditional Pennine moorland pattern with the main block running with the contours and the buildings virtually set into the hillside producing, in some cases, a 3 storey building on one side and a 2 or single storey building on the other. Standing nearly 700 feet above sea level on the windward side of an exposed hillside the buildings huddle together as if to provide a united front against the elements. The layout of the interior of the dwellings, with part of one directly above another etc., emphasises the close-knit community living around which the settlements were built. The layout is basically introspective with unexpected corners and turning providing interesting vistas with occasional long distance views, between buildings, down the Diggle Valley and up to the hills around. Sudden changes in level can result in an interesting roof line almost at eye level, while the irregularity of the roof patterns emphasises the organic growth of the settlement. Walls are of local gritstone with long and short stone work at corners and door openings. Roofs are of grey slate at a fairly shallow pitch although some buildings have been re-roofed in concrete tiles. Windows are basically of the mullion type and the general absence of timber features in the buildings emphasises the attention paid to the rigours of the climate. Harrop Green has areas of open space at route junctions, probably village greens originally, containing clumps of mature trees and other individual mature trees which play an important part in the village scene. The basic floorscape is hard, with house walls back and front coming up to, and alongside, the public roadways while stout stone walls divide public from private open space where individual garden plots have been developed.

CA01 DGM3172	400858	408043	Conservation Area	Diglea	Diglea was designated a Conservation Area in 1972. It extends over an area of 1.33 hectares. Diglea is a physically distinct hamlet to the north west of Diggle Village. The Diggle Brook flows along the valley to the south to join the River Tame between the villages of Uppermill and Dobcross. To the north of the settlement marginal agricultural land sweeps up to merge into the Pennine Moors, while to the east is the bleak Pennine section of the Peak District National Park. Most of the buildings date back to the 18th century although it is thought that some may be considerably older. Originally Diglea and the neighbouring Conservation Area of Harrop Green were small farming hamlets clustered around route junctions, but the large strip windows at first and second floor levels provide evidence of the handloom textile industry. The route pattern was radically altered and the hamlet physically separated by the construction of the Huddersfield Narrow Canal and the later Trans-Pennine railway line, which enters the Standedge tunnels at this point. The settlement form of Diglea follows the traditional Pennine moorland pattern with the main block running with the contours and the buildings virtually set into the hillside producing, in some cases, a 3- storey building on one side and a 2- or single-storey building on the other. Standing nearly 700 feet above sea level on the windward side of an exposed hillside, the buildings huddle together as if to provide a united front against the elements. The layout of the interior of the dwellings, with part of one directly above another etc., emphasises the close-knit community living around which the settlements were built. The layout is basically introspective with unexpected corners and turnings providing interesting vistas with occasional long distance views, between buildings, down the Diggle Valley and up to the hills around. Sudden changes in level can result in an interesting roof line almost at eye level, while the irregularity of the roof patterns emphasises the organic growth of the settlement. Walls are of local gritstone with long and short stonework at corners and door openings. Roofs are of grey slate at a fairly shallow pitch although some buildings have been re-roofed in concrete tiles. Windows are basically of the mullion type and the general absence of timber features in the buildings emphasises the attention paid to the rigours of the climate. Diglea has areas of open space at route junctions, probably village greens originally, containing clumps of mature trees and other individual mature trees which play an important part in the village scene. The basic floorscape is hard, with house walls back and front coming up to, and alongside, the public roadways while stout stone walls divide public from private open space where individual garden plots have been developed.	
CA15 DGM3182	398409	404078	Conservation Area	Royal George Mills, Greenfield	Royal George Mills was designated a Conservation Area in 1982 and extends over an area of 15.41 Hectares. Royal George Mills The Royal George Mills comprise a self-contained and isolated industrial complex lying between the River Tame and the Huddersfield Narrow Canal two thirds of a mile to the west of Greenfield. The Royal George Mills were originally called Gibbs Mills and were built in 1786 with local stone. The present name dates from 1800 and was intended as a compliment to King George III. The acquisition of the mills in 1835 by the Whitehead Brothers began a period of growth whereby the Whiteheads acquired considerable land interests in the Grasscroft and Friezland area. The Royal George Mills were the cornerstone of the Whitehead's 'empire' and hence one of significant local historical importance. The mills were originally concerned with the woollen trades. This was continued for some time although the Whiteheads were renowned as flag makers. With increasing demand for specialisation the firm entered the business of felt making and produced fine quality felts of all varieties. The complex has recently been converted to residential use.	
CA25 DGM3186	400317	406712	Conservation Area	Holly Grove, Diggle	Holly Grove Conservation Area was designated in 1988. The conservation area encompasses a small hamlet with a few structures which date from the 18th to 20th century. A significance majority of these structures are grade II listed and include farmhouses, houses, cottage and a wool wall. The presence of a wool wall indicated the domestic production of woollen cloth in the area. On historic maps from the mid to late 19th century, the small hamlet is located at the intersection of Moor Lane and Butterhouse Lane with various footpaths connecting the area to surrounding roads and structures. The former London, Midland and Scottish Railway tunnel was established underlead the small hamlet. The conservation area appears to have undergone minimal change and intervention since its depiction in historic maps, and remains legible as a 18th to 20th century hamlet. The materiality used across the conservation area include hammer-dressed watershot stone with graduated stone slate roof for the residential structures, and rubble sandstone masonry for the wool wall. The area is located within a rural setting, with a western slop towards the Huddersfield Narrow Canal and Diggle Brook. Trees and stone boundary walls surround Moor Lane and Butterhouse Lane and frame the views into and out of the conservation area with distant views of the Pennines in the distance. The approach from Butterhouse Lane enables for expansive views of the western landscape and looks down upon the open fields, Diggle and the Pennines.	
CA	397820	399634	Conservation Area	Millbrook	Millbrook Conservation Area was designated in 1991, and was later subject to a boundary review (n.d.). The conservation area is established along the north-east to south-west axis of Huddersfield Road and encompasses the planned Victorian	

NHLE / GMHER Ref	Easting	Northing	Designation	Name	Description	Period
DGM2202					industrial village of Millbrook, set within natural topography of the Swineshaw Valley. The area developed around key mills in the area; Staley (Howard), Staley (Kernshaw) and Oakwood mills, which were prominent features in the establishment of the industrial character. Millstone grit is the predominant building material used throughout Millbrook, contributing towards a unified townscape and forming a key element of the area's overall character and appearance. It was used in the construction of houses, St Jame's Church and school, boundary wall along Huddersfield Road and the stone setts on the street surfaces. The setts are considered to be an important feature in the area. Stone terrace houses dating from c. pre-1850 with internal courtyards to the west of Huddersfield Road, are also key features. Larger buildings such as St James's Church and School, Oakwood Mill and mill owner/managers houses flank Huddersfield Road and help frame the route through the conservation area. Situated within the Swineshaw Valley on the lower slopes of the eastern side of the Tames Valley, the conservation area benefits from distinctive viewshed. The views into and out of the conservation area capture the industrial character of Millbrook against the Pennine landscape in the surrounding area and contributes towards its overall appearance.	

A.4 Offline Non-Designated Heritage Assets

HER PrefRef	Easting	Northing	Type	Name	Description	Period
1000.1.0	396907	399433	Historic Building	Woodfield Farmhouse	Range of farmhouse and cottages, mid-C17 to mid-C18. 2-unit, 2-storey farmhouse.	Post-Medieval
1000.1.1	396899	399456	Historic Building	Barn at Woodfield Farm (former) (rebuilt?)	Barn, C17 cruck frame with walls and roof of squared rubble. 4-bay, single aisle, with lean-to additions to east, central door to the gable which has stone quoins, and a left hatch. Survived on site until 1990 when dismantled with a view to re-erection.	Post-Medieval
10426.1.0	397270	402557	Historic Building	Unitarian Church (former)	Low gabled front, two doorways with heavily rusticated arches and five-light window between. Tablet in gable "Christian Church and Sunday School built 1852".	Post-Medieval
13849.1.0	399737.282	406689.6405	Historic Building	Woolroad Bridge canal warehouse (former)	Canal warehouse, belonging to Nevell's Class II (1). Constructed of stone with two taking-in archways at ground-floor level and a possible taking-in door at first-floor level on the western frontage.	Post-Medieval
13850.1.0	399574	406613	Historic Building	Woolroad Canal Warehouse (at Stone Bottom Mills)	Canal warehouse, belonging to Nevell's class IV. A single-storey shed built flush with the canal with the roof projecting over the canal.	Post-Medieval
173.1.0	399613	406426	Historic Building	Saddleworth Station (former)	At north end of Saddleworth Viaduct, closed 1968; on west are 2-storey station buildings with gable and bay window, ornamental roof, veranda with cast-iron pillars, in use as residence.	Post-Medieval
17825.1.0	397429	401494	Historic Building	Mitre House	Built for the Bury Street Working Men's Club in 1900 at a cost of £3,000. Substantial multi-storey stone building, unusually shaped at one end like a bishop's mitre, where the main entrance used to be. Name and date carved into the stonework above original entrance. In the 1950s, it was used to house French, Italian and Irish workers brought over to work in the mills. (Milton Mill, Brunswick Mill and Carrhill Mills) owned by the Spinning and Wool Combing Company, locally known as 'The French Firm'. Then the Company used it as a children's nursery in the 1960s. Converted to apartments c.1997. (1)	Modern
17827.1.0	397420	401713	Historic Building	Post office (former)	Single-storey building of brick construction with tiled roof. Round-arched windows and doorway. Built in a corporate post office style rather than attempting to blend in with local buildings of stone construction. Constructed c.1930 in the garden of Albert House, to which it was attached, possibly with connecting access. Building now used as business premises.	Modern
17828.1.0	397423	401726	Historic Building	Albert House	Former mill owner’s house constructed from stone in a plain style. Two storeys plus attic. Large rectangular windows with stone lintels and sills. Round-arched window to stairs at rear. Constructed pre-1860 with south-facing frontage and entrance onto garden and short carriage drive. Occupied by Robert Buckley, who built the Albert Mills on the land between the house and the river Tame. Robert died in 1870, at the age of 62, only three years after the completion of the mills. The mills were then run by his sons until they got into financial difficulties in 1896, when the mills were sold to the Egmont Spinning Company. Cotton production ceased in 1933. Around 1930 a post office [HER 17827.1.0] was built in the garden of Albert House, attached and possibly with a connecting access via the former main entrance to the house. The house is now a private residence again. The west side of the house, which faces Manchester Road, was originally a side wall.	Post-Medieval to Modern
17864.1.0	397406	401869	Historic Building	Best of Brass public house	Two-storey public house with access to basement from the rear. Constructed of stone with a slate roof. An extension into the corner between the roads is in brick that has been painted cream. The building occupies a wedge-shaped site with a depth of around one metre at the south end. Built in the 1830s in the awkward angle between Manchester Road and Smith Hill (later Waggon Road).	Post-Medieval to Modern
17865.1.0	397294	401866	Historic Building	Apsley House	Very large Victorian house, built in 1848 with extensions added by 1890. Now divided into three separate dwellings: front of house overlooking carriage drive (northern section) retains name of 'Apsley House'; south-west section, which had contained the library, now called 'Apsley Cottage'; south-east section, which had been the servants' quarters, now called 'Apsley Side'. Gothic style. Stone construction with steeply pitched slate roof and overhanging eaves. Small slate-clad steeple. Some windows with round or pointed arches. Stone porch on main entrance from carriage drive. Built in 1848 with extensions added by 1890 with slight differences in style. Built by mill owner George Mayall for his daughter Hannah when she married mill manager George Andrew in 1848. Hannah died in 1877. George Andrew was elected as the first mayor of Mossley in 1885. He died in 1890.	Post-Medieval to Modern
17866.1.0	397093	401929	Historic Building	Livingstone Primary & Nursery School	Opened in 1915 as Livingstone Council School. It was built partly to take pupils from Abney British School, which closed that year. It was described as “an open-air school for education and health”. The classrooms were arranged around three sides of an open courtyard with a veranda at one end, giving opportunities for outdoor lessons. The classrooms had windows on both sides, designed so as not to let wind in when they were open. Inside the school was a bust of David Livingstone, after whom the school was named. He was seen as a good role model, having started work aged 10 in a cotton mill. A plaque referring	Modern

HER PrefRef	Easting	Northing	Type	Name	Description	Period
					to David Livingstone is situated near the entrance door. Single-storey building of brick construction with stone bands and a slate roof. Originally built around three sides of an open courtyard; extensions have since been added on the fourth side.	
17867.1.0	397249	401972	Historic Building	Brambles Lodge	Lodge, built c.1862 as gatehouse at one of the entrances to Mossley Hall, originally 'White Hall', built for mill owner George Mayall. The carved stone symbolic eagle on the front gable is from the Mayall family self-styled coat of arms. Single-storey house of stone construction with stone banding, quoins, pediment and decorative features. Slate roof. Symmetrical design but with added glazed porch to left.	Post-Medieval to Modern
17869.1.0	397319	402003	Historic Building	Royal Bank of Scotland (former)	Substantial imposing building of four storeys plus basement, previously a bank, built in 1892. Occupying a prominent position near Mossley railway station and on a major thoroughfare. Many original features, both inside and outside, have been retained. The former bank is an imposing building, exhibiting many decorative architectural features: stone balustrade fringing two levels of rooftop, decorative stonework over entrance porch and windows, with decorative sculptured stonework incorporating date. Many of the bank's original indoor features have been conserved, including panelling, fireplaces, architraves and cupboards. Building originally William Deacons bank, which was a bank local to the North West. Built to serve a 19th-century mill town, reflecting the importance and status projected by banks at that time. An interesting feature is that it was built to incorporate accommodation for the manager and his family. Became Royal Bank of Scotland (RBS). Closed as a bank in 2016, re-opening as a bar.	Post-Medieval to Modern
17870.1.0	397366	401978	Historic Building	The Commercial Inn	Elegant three-storey public house of symmetrical design constructed of stone with a slate roof. Second-floor windows are topped with flat cornices. First-floor windows have arched cornices with false keystones. Two bay windows to ground floor, with central doorway. The Commercial was the first public house to open in 'Bottom Mossley'. It was originally a private house constructed at the side of the new Turnpike road. When the road was completed and opened to through traffic in 1830, owner Joseph Carter obtained a full licence and opened it as the Commercial Hotel in 1831. It was busy as a stopping point for travellers on the Turnpike until the opening of the railway in 1849. It was then conveniently close to the station as well as being centrally located in the bottom part of the town.	Post-Medieval to Modern
17871.1.0	397358	402019	Historic Building	Mossley Station	Mossley Station was built by the London & North Western Railway Company as part of the Manchester to Huddersfield railway line. It opened on 1st August 1849. Along with the Huddersfield Narrow Canal, the railway was transformational in the industrial development of the Mossley cotton mills. A turntable in the goods yard (now the car park) enabled wagons to be taken, via a tunnel beneath the road, directly into the Britannia Mills complex, owned by the Mayall family, who had helped to finance the construction of the railway. The station building, of stone construction with steeply pitched slate roof, is both distinctive and iconic in relation to its importance to the identity of the town of Mossley.	Post-Medieval to Modern
17872.1.0	397392	402005	Historic Building	Bank House (formerly Devonshire House)	Built c.1840s and known as Devonshire House. It was the home of mill-owner George Mayall and his wife Esther for a number of years. In the 1860s he had White Hall, a grand mansion, built on the hill looking down over Devonshire House. White Hall later became Mossley Town Hall. The District Bank was built in 1848, attached to Devonshire House, which became the bank manager’s house and was then known as The Bank House. The bank closed in 1997 and the two properties are now both occupied by Pennine Medical Centre doctors’ surgery. Two-storey former mill-owner’s house of stone construction with slate roof. Stone window and door surrounds. South-facing frontage of symmetrical design, having an open outlook when the house was built. In 1884 the District Bank building [HER 17873.1.0] was attached to the north side.	Post-Medieval to Modern
17873.1.0	397389	402022	Historic Building	Former District Bank	Built for the Manchester and Liverpool District Banking Company, which shortened its name to the District Bank in 1924. The Mossley branch opened in 1847. This particular building was constructed in 1884. It eventually became the Nat West Bank, closing in May 1997. The Pennine Medical Centre doctors’ surgery, which had taken over the former bank manager's house next door, expanded to occupy the vacated building. A while after the change of use had taken place, a hapless robber burst in, expecting to hold up the bank and having to retreat sheepishly when his error was pointed out. Stone-built former bank in Italianate style comprising a single storey of almost double height. Round-arched windows with keystones. Cornice with dentil ornamentation. Pediment over entrance includes a relief of the bank’s coat of arms, bearing the motto “Decus Prudentiæ Merces” ("honour is the reward of prudence"). Italianate stone-built square chimney tower at side.	Post-Medieval to Modern
17874.1.0	397380	402073	Historic Building	The Sailors™ and Soldiers™ Recreation Rooms (former)	One of several cottages that were part of a row, originally built c.1850 by John Mayall, the owner of a number of cotton mills. No.207 stands on the corner of Queen Street, which led down to Mr Mayall's mills. The other cottages and the Britannia Inn have a low wall in front of them. No.207 has no front wall. Its doorway, set on the corner apex, makes it a suitable premises for use as a shop. They are all built of stone. No.207 has a stairway at the side to give access to the upper rooms. There	Post-Medieval to Modern

HER PrefRef	Easting	Northing	Type	Name	Description	Period
					appears to be a rear extension to the upper floor. Two of the cottages next to No.207 have now been joined to provide space for a hairdressers. In 1905 the property had been listed as a dining room then, in 1917, it became The Sailors' and Soldiers' Recreation Rooms. In 1939 No.207 was vacant. Since that time it has been occupied as the Railway Café, then a variety of shops including ladies' fashionable clothing, a DIY centre in 1974, and from 2018 as Aurora Wine Bar. In 2018 it was awarded a Blue Plaque as part of the town's First World War Trail.	
17875.1.0	397378	402100	Historic Building	The Britannia Inn	In 1857 two cottages owned by John Mayall (known as 'The Prince of Cotton Spinners' as he owned more mule spindles than any other private firm in the world) were turned into a beerhouse called The Musicians Arms. After eventually being granted a full licence, it was renamed The New Inn. In 1870 the two cottages were rebuilt and a new floor added and it became The Britannia Inn. John Mayall also owned the nearby Britannia Mills. The Britannia Inn was used for dinners and celebrations, e.g. railway porters' supper; Albert Mills fire brigade annual dinner; Mossley Botanical Society annual dinner; Tradesman's Mutual Protection Society dinner. In 1878 It was also used for meetings to discuss the plans for a second railway line through Mossley. It was also used for coroners' inquests, one being the case of Joseph Scott who died in an accident at the Little Britannia Mill, and which was reported in the local paper. Three-storey building of stone construction. Stone lintels and sills but otherwise of plain design.	Post-Medieval to Modern
17876.1.0	397309	402163	Historic Building	Mossley Hall Gatehouse	Built as gatehouse in c.1862 at one of the entrances to Mossley Hall, originally 'White Hall', built for mill owner George Mayall. A carved plaque shows the Mayall family's self-styled coat of arms, with motto 'Ne Cede Malis' ('Yield not to adversity' or 'Yield not to misfortune'). It is believed that the gatehouse was occupied by the family's butler. Two-storey house of stone construction with slate roof. Stone band below first-floor windows, stone quoins and decorative cornice. Curved-arch windows to first floor with keystones. Ground-floor windows facing road are slightly projecting, with central door now converted to window. Entrance to side. Side wall has coat of arms.	Post-Medieval to Modern
17877.1.0	397307	402172	Historic Building	Wesleyan Sunday school (former)	Previously a Wesleyan Methodist Sunday school, built in 1913. Substantial four-storey building, incorporating a slate rendered spire. Entrance approached by a substantial flight of steps with name and date carved in the stonework above. One of only two remaining examples of a Methodist Sunday school building to survive in Mossley	Modern
17889.1.0	397296	402239	Historic Building	East View	Large house of stone construction built c.1860. Single-storey bay window to front. Originally occupied by Samuel Buckley, a waste cotton dealer, and his family. By 1871 East View was occupied by William Mayall, son of mill owner John Mayall, with his family. In 1901 William's son Leonard was head of the household. By 1911 Doctor Joseph Walters and his family were living there, having moved from Glamorgan. The house would appear to have been the doctor's surgery as well as his residence	Post-Medieval to Modern
17890.1.0	397297	402259	Historic Building	Clifton Villa	A villa, built around 1860 by the Mayall family, who owned mills in the town. Originally occupied by Miles Mayall, who lived there until his death in 1900. The house was then divided into two separate properties. The building is of stone construction with stone quoins and stone bands. Slate roof. Originally almost symmetrical, with small central front gable. Small side extension to accommodate a second entrance and staircase when the house was divided into two around 1900. Wooden porch extension to right.	Post-Medieval to Modern
17891.1.0	397134	402261	Historic Building	St Joseph's School	The present school opened in 1930, replacing an earlier school nearby built in 1874. Apart from a recent extension, the school is single storey, of red brick with a slate roof. Built on an awkwardly shaped plot, it was designed on what were then modern principles, with a corridor allowing each room to get through ventilation, a central hall, and large rooms for handicrafts and domestic science. The toilets were separated from the building by an open-air walkway, which was considered to be a good thing on health grounds. There was even hot water on tap. When the building was complete, the council provided the furniture and equipment.	Modern
17900.1.0	397106	402356	Historic Building	St Joseph's Roman Catholic Church	A Roman Catholic parish was formed in Mossley in 1856, with the members meeting originally in a room on Smith Street which was also used by other denominations. A church was built on Argyle Street, opening in 1862. From 1864 to 1874 the church was also used as a school until a school was built on adjoining land. In the 1960s this church was demolished and replaced by the present building on the same site. It was designed by architects Desmond Williams & Associates and opened by the Bishop of Salford in March 1965. Its striking modern design won much praise. It was the first church in the diocese to have two altars in line with the Vatican's new recommendations. Church constructed mostly in brick, with steeply pitched tiled roof. Small copper steeple. Circular window on east side. Angle of roof reflected in design of canopy above entrance.	Modern

HER PrefRef	Easting	Northing	Type	Name	Description	Period
17903.1.0	397262	402722	Historic Building	The Shears Inn (former)	A 1790s three-storey stone-built property, originally a pub and now divided into private houses. In the 1850s it hosted regular September fairs and vegetable shows and a 1858 newspaper noted a visit from the newly formed Mossley Druids' Band. When auctioned in 1878 the sale included land, brewhouse and stabling. However, in 1890 a public house survey noted there was no accommodation for travellers, stabling for only 2 horses and only a maximum of 10 people could be provided with refreshment other than drink. An inspection in 1913 stated that the ceilings were too low, sanitary conditions were poor and the approach to the pub too steep (a gradient of 1 in 3). It was suggested that it needed an entire rebuild. However, it continued on for many more years and finally closed as a pub in 1970. It has been converted into two private dwellings.	Post-Medieval to Modern
17906.1.0	397531	403000	Historic Building	Church Inn	Public house at end of terrace. Two storeys plus basement. Brick construction with stone frontage. Slate roof. Stone lintels and sills. Built in the 1820s as a detached private house. By 1837 it had been turned into a fully licensed pub called the Hardman’s Arms. After the church of St John the Baptist was opened close by in 1878, the pub was renamed the Church Inn. A terrace of houses was built a little to the east. Then, around 1900, two houses were built in the gap between the terrace and the pub, making it part of the terrace.	Post-Medieval to Modern
17907.1.0	397556	402980	Historic Building	St John's School (former)	Opened in May 1865 as 'Roughtown School', paid for mainly by James Heywood Whitehead of Royal George Mills. Became 'St John’s School' when the adjacent church was opened in 1878. It had a large main classroom measuring 70' by 22' and a smaller classroom for infants, plus an adjacent school house. The infants' section was badly damaged by a fire in 1912, with the roof collapsing. It was rebuilt and additional space added, with a corridor separating it from the original 1865 section. The school closed in 1979, when it amalgamated with nearby Milton School, which became Milton St John’s School. The building continues to be used as a community centre. Stone construction with slate roof. Single storey with part-basement. Central corridor with former classrooms on each side.	Post-Medieval to Modern
17908.1.0	397628	403289	Historic Building	The Rising Sun public house	Two-storey detached pub, constructed of stone with slate roof. Original central doorway on front wall has been converted to a window. Entrance porch added on side wall. The Rising Sun was open as a beer house by 1850. It became a fully licensed public house in 1880. The Rising Sun was the tram terminus from 1904 to 1925. The name probably comes from its uninterrupted views eastwards across the valley, making it an ideal place from which to view the rising sun.	Post-Medieval to Modern
17909.1.0	397725	403726	Historic Building	Grove Sunday School (former)	Opened in 1843 to accommodate a branch of the New Connexion Methodist Sunday School. However, after just three years, the school closed as the trustees could not afford to maintain it and had to sell the building. It has been converted to provide residential accommodation. Constructed in stone with slate roof. Two storeys at rear plus attic. Entrance at road level is to the upper ground floor on gable end wall, where there are two windows at attic level, plus three windows, a door and a blocked-up doorway at road level.	Post-Medieval to Modern
17911.1.0	397451	402661	Historic Building	Milton St John's School	Opened in 1913 as 'Milton Council School', the first council school to be built in Mossley. Built on a steep hillside, it originally had part of one playground underneath three of the classrooms, providing shelter from rain. A bust of poet John Milton was given to the school at its opening, although the name of the school refers to a local area. In 1979 Milton School amalgamated with nearby St John’s School, to form 'Milton St John’s School', using the Milton School building. The amalgamation was due partly to falling birth rates at the time. 40 students plus 8 nursery pupils from St John’s joined the 130 pupils at Milton. The merger was reported to have gone very smoothly in spite of some initial anxiety from parents. School, constructed in brick with slate roof. Built on a slope in a V-shape having a central hall with corridors leading to classrooms on each side. Classrooms have large rectangular south-facing windows. Small two-storey sections on north side providing office accommodation.	Modern
17912.1.0	397637	402707	Historic Building	Drill hall (former)	ormer drill hall built in 1912, now clubhouse of the Tameside Sports Association. The drill hall was built for companies of the Duke of Wellington's Territorial West Riding Regiment. It was classed as a medium structure. It was for the accommodation of two companies of Infantry, the Mossley/ Micklehurst companies, 7th Battalion West Riding Duke of Wellington's Regiment. The site is a corner one and lent itself easily to the arrangement of entrances and exits. A large drill hall allowed gatherings of the regiment to take place. Along one side of the hall were the Officer's and Orderlies' rooms, the clothing and arms stores. At the opposite end of the hall communication is made with the back block which contained the lecture room, the men's club and the sergeant's mess, each with their own toilet facilities. In the basement is a shooting range 75' long for instruction in aiming and for miniature cartridge practice. The floor of the drill hall had had 1" Redwood boarding laid on breeze. To the rear of the drill hall is a house built for the drill instructor. It is the only local drill hall with a shooting range. The building eventually replaced an old drill hall sited off Lees Road that had been made of iron and timber and was the	Modern

					headquarters of the Mossley Detachment of the 2nd Volunteer Battalion West Riding Regiment. That building blew down in 1938 after it had remained unused for many years	
17914.1.0	397604	402862	Historic Building	Methodist school (former)	Former Methodist school, now occupied by organ builders. Substantial building in brick and stone with slate roof. Circular stone plaque above entrance reads “Erected AD 1866”. Single storey to front; two to three storeys at back. Original 1866 building in light-coloured brick with decorative 2-tone brickwork around entrance, windows, date plaque and below roof guttering. Pointed-arched windows. Large extension in stone, at right-angles to original, forming an L-shape. Further modern extension imitating the older style.	Post-Medieval to Modern
17915.1.0	397532	402846	Historic Building	64â“72 Carrhill Road	Five houses of two-storey stone construction with slate roof. Mullioned windows. Now joined onto other houses at each end to form part of a longer terrace. These houses were built around 1820–1840 for individuals who were members of an association. This could be considered an early form of building society, in contrast to the nearby terraces built by mill owners for their workers	Post-Medieval to Modern
17916.1.0	397857	402915	Historic Building	Roughtown Tavern (former)	Former beerhouse of two storeys plus basement. Stone construction with slate roof. The main entrance had striking stone quoins on each side. The building occupied an unusual triangular footprint. Now split into two private residences. Built in the 1850s. It was a beerhouse until it closed in 1939 when it was described as being out of date with bad sanitary conditions and facilities. Trade had been falling off, so the brewery did not contest the decision. It was divided into two small houses.	Post-Medieval to Modern
17917.1.0	397278	402464	Historic Building	Annaville Terrace	A terrace of three houses with an engraved datestone stating 'ANNAVILLE TERRACE 1870'. A Belgium Relief Committee was set up in Mossley in November 1914. Towns were asked to provide accommodation for Belgian refugees and it was determined that an unoccupied house might be found. A number of efforts raised money for the relief fund and tradesmen were soon freely decorating, plastering and doing general repairs to a house at Annaville Terrace. It was conveniently near to the military hospital at the Mechanics Hall where some injured Belgian soldiers were already being cared for. Flags of Belgium were hoisted on poles at Annaville Terrace and at the Mechanics. In January 1915 a young Belgian girl, Maria Decorte, travelled alone to Mossley looking for her brother Evariste who was a wounded soldier in the military hospital. She was met at the station, brought to meet him and became the first of the Belgian residents at Annaville Terrace. She was a dressmaker and was willing to do tasks in return for Mossley's hospitality. Annaville Terrace was awarded a Blue Plaque in 2018 as part of the Mossley First World War Trail. It also features on the Routes to Roots Trail.	Post-Medieval to Modern
17918.1.0	397293	402345	Historic Building	Mount Gambier	Mount Gambier is a pair of stone-built, semi-detached houses built in 1871. The building is symmetrical with steps at each side to access the doorways. Number 25 had 7 rooms, whilst number 27 had 6 rooms (declared in the census of 1911) The windows are stone mullioned. An extra piece of land between the building and Jacob's Ladder was purchased, by the Miss Beswick and Mrs Kershaw from the Earl of Stamford in 1880. It is of historic interest due to its name and the Beswick family's history including their benevolence to local churches and charities. In 1871 the family living in "Mount Gambier" Mossley was Sarah Beswick head, widow 73 born in Bordeaux France, Matilda Kershaw daughter, widow 43 born Bordeaux France, Hannah Beswick daughter, un married 41 born Bordeaux France. Andrew Beswick son had not yet arrived home. He first appeared in 1881 listed in the Census as the head, unmarried 58 retired sheep farmer born France along with his sisters Matilda and Hannah also born France They now employed a servant. The other part of the building was occupied and presumably rented at each census. In the1891census just Andrew and Hannah Beswick with two servants were in Mount Gambier. Matilda had died in 1889. By 1901 Andrew then a JP had died leaving Hannah, his sister aged 70 living with two servants in 25 Stamford Road (Mount Gambier). The Beswick family gave the font, the clock for the tower and several beautiful memorial stained glass windows to St George’s during their lifetimes. When Hannah Beswick died aged 74 on 30th December 1905 she left an estate of £23,810 Each Anglican Church in Mossley benefitted from her generous bequests as well as all the local hospitals including The Henshaw Blind Asylum Old Trafford and The Manchester Eye Hospital. Mount Gambier was auctioned for £600 in June 1905. From 1915 until 1945 it was used as Police houses. Since that time the two separate dwellings number 25 and 27 have been occupied continuously.	Post-Medieval to Modern
17920.1.0	397979	403150	Historic Building	Roaches Lock public house	Two-storey detached public house constructed from stone with a slate roof. Modern single storey extension on left hand side built to match original. Stone lintels and sills. The Roaches Lock public house opened in the 1860s as a beerhouse called the ‘Bridge Inn’, being adjacent to the new bridge carrying the Manchester to Wakefield turnpike road over the River Tame. It was sometimes used for holding inquests into deaths that had occurred in the part of Mossley that lay within Cheshire. It remained a beerhouse until 1960, when it became fully licensed. In 1982 it was re-named ‘Roaches Lock’ after the canal lock that stands close by at the rear.	Post-Medieval to Modern

HER PrefRef	Easting	Northing	Type	Name	Description	Period
17921.1.0	398014	403211	Historic Building	Tin Tabernacle Methodist Chapel (former)	Single-storey former chapel originally having corrugated iron finish, but now with walls rendered and modern roof. The Roaches Wesleyan Methodists met initially in a room in nearby Bank Mill. In 1898 a small chapel was opened and was used for services and for Sunday School. It was known as the 'Tin Tabernacle' because of its construction. The chapel closed in 1964 when the congregation had diminished to 20 members. The building has since been used for light engineering, printing and as an Indian restaurant.	Post-Medieval to Modern
17922.1.0	398032	403253	Historic Building	Old Fire Station	Two-storey building of brick construction with stone curved lintels above windows and vehicle doors. Castellated brick tower, probably built for training purposes. Newer steel training tower in rear yard. Vehicle doors now infilled with glazing. Opened in April 1913, with two appliance bays and an ambulance bay. The adjoining house accommodated the chief fire officer. The first holder of this post was Mr RH Buckley, who was also the town surveyor. Many of the fireman were part time and had previously been members of the volunteer fire fighting groups of individual mills. When the station opened it had only one fire appliance. In 1915 a second was obtained and the brigade took over responsibility for Saddleworth district. At first an ambulance was also housed in the station, manned by the firemen. Emergency telephone calls went straight to the fire station. The station closed in 1989 when a replacement was built near the market ground	Modern
17923.1.0	398085	403336	Historic Building	Tollemache Arms public house	Two-storey end of terrace public house constructed from stone with a slate roof. Stone lintels above door and windows. The row of cottages were built in 1793, around the time a start was being made on the canal behind them. This was an area of new development on what was to become a new turnpike road along the valley bottom. By 1837 the left hand cottages had been made into the Tollemache Arms. The name refers to Lord Tollemache, who had owned the land in the part of Mossley that lay in Cheshire before selling the land to Lord Stamford in 1841. The pub sign features a coat of arms from the Tollemache family.	Post-Medieval to Modern
18088.1.0	400285	407853	Historic Building	Ellis Mill	Part of group of industrial buildings known locally as Tanners after the Greenfield Tanner brothers took over. Two-storey, 14-bay, double-depth mill. Blue slate double ridge roof and central valley with stone copes, left gable ashlar stone stack. 14x 9 pane windows on each of ground and 1st floors, stone lintels and sills running as string course; 2 courses from roof line a decorative proud string and corbels run full length. Left gable: blocked main doorway with inserted modern door, door surround of ashlar stone with console brackets, frieze and pediment; 2x6-pane windows ground floor and modern goods access door below attic hoist tower; 1st floor 4x6-pane windows and 1 toilet window. Some original cast iron downspouts which are inset in wall below ground floor window sill level. First shown on the Ordnance Survey 2nd Revision 1:2500 map of 1932.	Modern
18981.1.0	400796.8825	408052.8864	Historic Building	Diggle Hotel	Diggle Hotel built early 19th century. Three-storey and three-bay double depth. Central doorway with rusticated quoins. Ground floor left and right square faced lintel, sills & sides windows. Two stringer courses separate the first and second floors each with three windows smaller with height. The front with rusticated quoins. Left gable with beer cellar door each storey with one window with large lintel. Right gable single storey facilities and kitchen. Rear central stair window three stories with emergency door and metal steps at first-floor level. Each floor with four-light recessed square mullion windows to left and right, string courses between each floor. Quarry faced stone. Ridge chimney stack. A beer house in Diglee was licenced 1833-1858 the forerunner of The Diggle Hotel. Frederick Radcliffe ran both establishments	Post-Medieval to Modern
18982.1.0	400503.8821	408026.2072	Historic Building	Beaulah House	Built before 1897 as a residence for Matthew Bailey, shawl manufacturer, Grove Mill. Later Dobcross Loom Works General manager's mansion. 2-storey, 2 bays, double depth. Hammer-dressed sandstone with proud plinth. Blue slate hipped roof, 4 gable tall stone stacks. Front elevation; dressed stone surround arched doorway with moulding and overlight with '1' etched in glass; ground-floor dressed-stone bay windows to right with stop-chamfered mullions, leaded roof; left ground-floor and first-floor windows 3-light mullion windows left and right with hooded moulding across the whole elevation, central 1-light window above door pair. Gable with corbel brackets for guttering. Example of industrial success in the form of an imposing mansion with large, enclosed gardens.	Post-Medieval to Modern
18983.1.0	400399.7816	407639.2035	Historic Building	Diggle Junction Signal Box	Diggle Junction Signal Box, originally Diggle No1 signal box, opened in 1885 near the western portal of the Standedge Tunnels. It was equipped with 59 levers and was extended to 81 levers in 1891 on closure of Diggle No2 signal box near the station. Initially it controlled traffic on one down line (away from London) and one up line. Second lines were added in 1886 when the Micklehurst loop line from Stalybridge was opened. The signal box also controlled a single line that served the Dobcross Loom Works, which had their own engine 'The Foundry Rocket.' The building is a good example of a large London & North Western Railway Type 4 signal box, comprising a timber-framed box mounted on a brick base. It features a slate-covered gabled roof, introduced by the LNWR in 1876.	Post-Medieval to Modern

					windows in the vernacular style. Roof with 20th-century window lights. Good repair. Mullioned rear windows not in style of remainder of house	
18998.1.0	400603.8253	407805.2528	Historic Building	Green Bank House	Former mill owner's house in own grounds built for WD Hall of Diggle Bridge Mill in 1858. The two-storey, four-bay, double depth house is of hammer-dressed sandstone with outer two bays with transverse gables. It has a blue slate roof with stone copes on gables, and the roof is divided into four sections. Front elevation: Two gable ends with large stone surround bow window at ground level with large window divided into three sections by square stone mullion. Crenelated central section set back with two windows either side of proud door section doorway with semi-circular arch and stone voussoirs. Ends of building with two large windows on each floor either side of outside chimney breast, one of which has tall stone stack. Rear end bays have one first-floor window and two lower stair windows. Central section with arched tall window. Rear public road separated by high wall now with ornamental gate way. Stone garage in grounds and gate posts on main road on entry to drive.	Post-Medieval to Modern
19000.1.0	400714.2714	407931.1822	Historic Building	Kiln Green School	Formerly day school. Original non-denominational school built in 1785 with 10 ground floor mullion window. Later four roomed teacher's house attached. Built by public subscription 1870, and extended 1894 at the cost of W.D. Hall. Became a church school before closure in 1927 when it was transferred to the West Riding new school on Sam Road. Pointed front proud with 3 arched windows with rubbed stone arch with bevels & quoin surrounds, proud sills. Above pointed arch bevelled window with decorative stonework surround to both sides. Left wing front 2 tall windows with lintels & proud sills, to right doorway with decorative surround. Gable with 2 tall windows with decorative, chamfered lintels and proud sills. Right window with half height inserted modern door. Gable end ridge chimney. To right inserted 1960s door with steps retaining top half of window decorative stonework. New chancel added 5-sided triangular roof & windows to sides. Steps to cellar. Blue slate roof with stone copes with ogee supports to the front. 3 ridge ventilators. Chimney to rear. Original outside toilets removed 1960s. Playground walls mostly extant. Plaque Diggle School rebuilt by subscription AD 1870. Chiselled into quoin on extension 1894 W.D.H.	Post-Medieval to Modern
19001.1.0	400089.6394	407589.5056	Historic Building	The Gate Inn	The Gate Inn was established next to the Ward Lane crossroads on the new Standedge to Oldham turnpike in c.1801. The building is listed in the 1803 licensing records as the Gate Inn. The inn was rebuilt to a design by Alfred James Howcroft in 1926 by Gartsides Brewery.	Post-Medieval to Modern
19002.1.0	400456.0446	408033.0186	Historic Building	Diggle Primary School	The school was erected in 1927 by West Riding to replace a public subscription and later church school at Kilngreen. Original millstone grit building with central corridor with three classrooms to the south elevation and two smaller rooms either side of large hall to north. South elevation features a central bay gabled with copings and three windows with sandstone sills and lintels, windows repeated on other two bays, basement door with steps and three in-filled windows. The east elevation has a deeply recessed central doorway topped by 15 horizontal paned fan light, framed by ashlar pilasters. The north elevation has a large central middle bay with four large windows of which two are arched extending up into the two central false gables, ashlar coping stones, west bay has three-light mullion window and two square ones on the east bay. Roof blue slate. Alterations and extension to front elevation and to west elevation. Original setting surviving intact; gate posts, fan light, south west approach steps. Original wrought-iron fencing renewed.	Modern
19003.1.0	400829.9272	408036.8102	Historic Building	3 Diglea	The westernmost property of a row of three-storey, stone-built cottages dating to the late 18th century. The property comprises a double-bay, double-depth, three-storey house attached to listed building. Watershot squared millstone grit. The elevation to rear appears to be original whilst that to the south dates to the late 19th century. The roadside elevation features two windows each floor, with large double lintels and proud square sills. Modern windows. Gable, central ground floor door with quoins surround, first floor left of door and two two-light window and to right second floor mullion windows with king mullion opposite gable has one two-light window. Unusually, the north-facing rear is front. Ground floor covered by approach to house, only single window visible. All floors with quoins & door surround. First floor to left doorway. To right are seven square faced recessed mullion windows with lintel and sill. Second floor has ten windows of the same type. Gutters on ogee stone corbels. Roof graduated stone slate. Gable watertabled chimney adjoining No 5, central ridge chimney, rear front corner stack opposite gable.	Post-Medieval to Modern
19004.1.0	400823.8964	408045.8561	Historic Building	1 Diglea	House C18. Double depth, 2 bays. Ground floor right door with large lintel & quoin surround infilled with window top & stone below. Left modern window with lintel square faces lintel & jambs, left square surround for replaced 2-light modern window. First floor from right 2-light mullion window with square surround, possible infill, then 8-light square-faced mullion window. Corbels. Graduated stone slate roof with ridge stack to right. Roof & front wall indicate adjoining different build. Rear from right ground floor partial hidden, change in wall construction & 2-light square-faced mullion window with infilled doorway. First	Post-Medieval to Modern

19038.1.0	399814.7201	406712.1624	Historic Building	Canal Lock 25W on Huddersfield Narrow Canal	Built between 1794 and 1799. Benjamin Outram engineer. Hammer-dressed stone with tooled markings. Single upper gate, double lower gate and mouth grooved for stop planks.	Post-Medieval to Modern
19039.1.0	399903.5594	406770.4588	Historic Building	Canal Lock 26W on Huddersfield Narrow Canal	Built between 1794 and 1799. Benjamin Outram engineer. Hammer-dressed stone with tooled markings. Single upper gate, single lower gate	Post-Medieval to Modern
19040.1.0	400023.4443	406870.7981	Historic Building	Canal Lock 27W on Huddersfield Narrow Canal	Built between 1794 and 1799. Benjamin Outram engineer. Hammer-dressed stone with tooled markings. Single upper gate, single lower gate	Post-Medieval to Modern
19041.1.0	400105.2599	406976.8896	Historic Building	Canal Lock 28 on Huddersfield Narrow Canal	Built between 1794 and 1799. Benjamin Outram engineer. Hammer-dressed stone with tooled markings. Single upper gate, single lower gate.	Post-Medieval to Modern
19042.1.0	400178.1679	407095.0267	Historic Building	Canal Lock 29W on Huddersfield Narrow Canal	Built between 1794 and 1799. Benjamin Outram engineer. Located immediately north of the Grade II Listed Huddersfield Narrow Canal No.69 Bridge (HER 5501.1.0). Hammer-dressed stone with tooled markings. Single upper gate, single lower gate.	Post-Medieval to Modern
19043.1.0	400226.2697	407231.441	Historic Building	Canal Lock 30W on Huddersfield Narrow Canal	Built between 1794 and 1799. Benjamin Outram engineer. Close to the site of the former Dobcross Loom Works (HER 6244.1.0). Hammer-dressed stone with tooled markings. Single upper gate, single lower gate	Post-Medieval to Modern
19044.1.0	400340.7103	407686.2865	Historic Building	Canal Lock 32W on Huddersfield Narrow Canal	Built between 1794 and 1799. Benjamin Outram engineer. Located on the eastern edge of Diggle Fields Park. Hammer-dressed stone with tooled markings. Single upper gate, single lower gate.	Post-Medieval to Modern
19046.1.0	399608.7739	405603.6573	Historic Building	Sacred Heart & St William Catholic Church	A prominent church on the High Street that was built in 1873 and owned originally by the Ebenezer Congregation. In 1966, the Diocese of Leeds purchased the church building from the Ebenezer Congregation, which relocated to new premises across the road.	Post-Medieval to Modern

HER PrefRef	Easting	Northing	Type	Name	Description	Period
19048.1.0	399701.3985	405674.3759	Historic Building	Saddleworth Boutique	Two-storey (plus attic) commercial; property of a rectangular plan and gabled roof. The western gable overlooks High Street and contains the main entrance. The ground floor of the gable elevation has a modern shop front window, with four sash windows illuminating the first floor and a single bulls-eye window affording light to the attic, with the '1914' datestone above.	Modern
19055.1.0	399842.5677	406103.6212	Historic Building	Uppermill School	Uppermill's Council School was opened by the West Riding County Council (WRCC) in 1911. In 1961 it was incorporated into a large, modern School for secondary education, however, the school closed in February 2022 and much of the site was demolished shortly after. The historic building at the centre of the site is the only structure that remains on the site.	Modern
19058.1.0	398344.7218	404249.203	Historic Building	Friezland School	The school was opened in 1915. It is only one of three surviving Edwardian schools in Saddleworth. The building was constructed by the West Riding County Council in the very early 20th century. It was one of only four WRCC schools built to these designs along with those in Diggle, Uppermill and Greenfield.	Modern
19059.1.0	398309.5775	404478.3788	Historic Building	Westfield	A large, stone-built property identified as 'Westfield' on the Ordnance Survey 1st Edition map of 1894. Grand, stone-built, detached house, with separate L-shaped stone structure (probable converted barn with attached living quarters, No.39A) located to the west on the road frontage. Numerous small extensions to both house and barn, with all structures in use as domestic dwellings. Imposing structure, originally just one of a small number of grand residences along Mossley Road, which is now much infilled with numerous types of other houses. Westfield occupies a position overlooking a distinct bluff and hillslope down to the railway (L. & N.W.R. Oldham Branch).	Post-Medieval to Modern
19060.1.0	398445.5101	404545.0096	Historic Building	10-12 Mossley Road	First shown on the Ordnance Survey 1st Edition map of 1894. (1) A three-storey (plus basement), double-fronted, stone-built detached house. Symmetry across three bays, all windows within stone borders. Central entrance at ground floor surrounded by decorative stone quoin-esque border with trapezoidal lintel, approached via front steps and ‘bridge’ over basement lightwell. Short chimney stacks over the apexes of the east and west facing gables.	Post-Medieval to Modern
19061.1.0	398562.6729	404577.9737	Historic Building	58 Oldham Road	First shown on the Ordnance Survey 1st Edition map of 1894. (1) Proportions and mullioned windows indicative of the building likely having origins in the 18th century. A small, stone-built cottage of probable 18th-century date. Main entrance on the right-hand side of the front elevation with stone step, jambs and lintel. Three rectangular windows and a small square window share a stone casement, with matching cills, lintels and mullions at ground level. Four windows at first floor level have a similar construction. Single chimney stack over the western gable apex. Two-thirds of a triple window on the eastern gable have been blocked up. Access lane between the house and the adjacent pub is cobbled, with dressed stone blocks forming two smoother surfaces to ease passage of historic and modern vehicles. Shares characteristics with the adjacent Farrars Arms and its attached domestic forms, suggesting a shared construction date.	Post-Medieval to Modern
19062.1.0	398581.6964	404580.1842	Historic Building	The Farrars Arms public house	Pub website states established 1702. The building is referred to as Shaw Hall in the Saddleworth Church Register for 1762, which records Radcliffe Whitehead as the innkeeper. The Farrars were the lords of the manor and the Whiteheads were their agents, responsible for collecting rents from the tenants. Ralph Whitehead took over the pub in 1788 and, in July 1796, the inn was the venue for a meeting of the trustees of the Standedge to Mumps Brook Turnpike. The tenancy of the Farrars Arms was advertised in the Manchester Guardian on 3 March 1832, which stated that there was a brewhouse, barn, stables and other outbuildings, together with approximately 20 acres of land. The pub was said to adjoin the turnpike road approximately halfway between Manchester and Huddersfield. A two- and three-storey stone-built property dating to the early 18th century. All windows with stone sills, lintels and mullions (painted black) – single, double, triple and quad forms, in various square and rectangular shapes. Dominates the street-scene along this section of Oldham Road and shares characteristics with other built forms, including Nos.52 and 54 (to which the pub is attached), the adjacent 58 Oldham Road, and the cobbled street separating the two structures.	Post-Medieval to Modern
19069.1.0	400651.5948	407816.4424	Historic Building	Green Bank Cottage	Row of two cottages built in the mid-19th century to house laundry girls. Single depth, 2 storey, 3 bay cottages (with late 20thcentury extension at eastern end) converted to one. Hammer dressed sandstone. Roof: graduated stone with stone corbels, 1 gable stone stack and 1 removed. Front elevation: original 2 central doorways, one filled in and one with porch covering. Each house with 2 windows on each floor. Rear 2 first floor windows and one with guard at ground level. Separated from Lane at rear by wall, in same grounds as Green Bank House. The original Laundry converted to a house in the late 20th century.	Post-Medieval to Modern

HER PrefRef	Easting	Northing	Type	Name	Description	Period
2175.1.0	397139	402381	Historic Building	Mossley Police Station (former)	Still a working police station. Mid-C19. Very similar to Droylsden Station. Stone built.	Post-Medieval to Modern
2179.1.0	396080	398639	Historic Building	Palace Cinema (former)	Originally known as the Empire Picture Palace, this cinema was opened in 1913.	Modern
2180.1.0	397388	402620	Historic Building	Spring Cottages, Mossley	Built between 1822 and 1851. The 5 rows of terraces known as Spring Cottages were erected on land attached to Carr Hill Mill.	Post-Medieval to Modern
2184.1.0	396199	398649	Historic Building	Stalybridge Fire Station (former)	Of the purpose-built [fire] stations in Tameside which still survive, one of the earliest is the building at Stalybridge, on the corner of Waterloo Road and King Street. This building was begun in 1903 and opened in 1905.	Post-Medieval to Modern
2196.1.0	396236	398553	Historic Building	71 Market Street, Stalybridge (shop)	Where shop fronts were distinguished from domestic houses this was normally by a larger ground-floor window, perhaps displaying some of the goods on sale as with this building.	Post-Medieval to Modern
2197.1.0	396258	398575	Historic Building	78â“84 Market Street, Stalybridge	Nos.78–84 Market Street were built in 1895 and are a group of four shop units contained within a single building.	Post-Medieval to Modern
3301.1.0	398062	403255	Historic Building	Bank Mill	Marked as a cotton mill on maps. Very little remains. The sole surviving building is a mid-C19 stone-built weaving shed, and two walls from the former spinning mill to the north side.	Post-Medieval to Modern
3305.1.0	397549	402050	Historic Building	Queen Street Mills (former)	Marked on maps as a cotton mill. Very heavily modified site. Two spinning mills of uncertain date. Built by John and George Mayall, to 5 storeys and attic and of 20 bays.	Post-Medieval to Modern
3306.1.0	397439	402050	Historic Building	Longlands Mill	Marked on map as a cotton mill and on map as a cotton waste mill. The mill is of 3 storeys and 9x3 bays, stone built. Built in 1871 as a steam-powered cotton spinning mill. Built by the firm of John Mayall, it closed down in 1931.	Post-Medieval to Modern
3307.1.0	397369	402139	Historic Building	Britannia Mill (Britannia Old Mill)	Marked on maps as a cotton mill. The main building is mid-C19, of 2 storeys (plus basement) and 14x2 bays. Stone built. Britannia Mills remained for thirty-four years (1857–91) the largest cotton spinning firm in the world, operating 440,000 spindles at its peak in 1893–96	Post-Medieval to Modern
3307.2.0	397478.7276	402116.7221	Historic Building	Britannia New Mill	The 1955 Ordnance Survey map (1) depicts Britannia Mill as being still in use as a cotton mill, but the adjoining structures had been demolished and a large single-storey north-light shed labelled 'Britannia New Mill (Cotton & Fabric)' erected on the land to the east in the mid-20th century; the mill is absent from the OS 1:2500 revision map of 1938 but is shown on the next revision of 1955.	Modern
3338.1.0	397260	400959	Historic Building	Weir Mill	Marked on maps (1,2) as a cotton mill. Mid-C19 spinning mill site. Spinning mill No.1: 4 storeys (including basement), stone built.	Post-Medieval to Modern
3382.1.0	396610	398679	Historic Building	Stokes Cotton Waste Mill	Marked on the maps as a cotton waste mill (1)(2). There are two main buildings. No.1: early C19, stone built. 2 storeys and 9x2 bays. Gable roof, partly replaced with asbestos.	Post-Medieval to Modern
3476.1.0	396750	398900	Historic Building	North End Mill (Higher Mill)	Marked on maps (1,2) as a cotton mill and on (3) as a paper mill. The main building is brick built, of 3 storeys and 16x3 bays.	Post-Medieval to Modern
5800.1.0	396867	398951	Historic Building	Riverside Mills (former)	Mentioned in (1) as a weaving mill from 1883 until 1889, again from c.1930s until c.1962, and as a cotton spinning mill from 1889 until the 1930s.	Post-Medieval to Modern
6045.1.0	397969	403730	Historic Building	Wright Mill	Marked on maps (1,2) as a woollen mill. Now only the mill building itself survives. It is early C19 and stone built. 2 storeys and 4x2 bays.	Post-Medieval to Modern
6046.1.0	398330	403997	Historic Building	Royal George Mills (former)	Mill No.1: mid- to late C19, stone built with timber internal structure. 4 storeys and 12x4 bays.	Post-Medieval to Modern
6094.1.0	400413	407837	Historic Building	Warth Mill (or Wharf Mill)	Marked on the map as a cotton mill (1). Former woollen mill belonging to the Co-operative Wholesale Society, taken over by Tanner Bros. 1931, for cotton weaving. [Built 1919.] Ceased production in 1971	Post-Medieval to Modern
6097.1.0	399564	406638	Historic Building	Stone Bottom Mill	Marked on map (1) as a woollen mill and as a flannel mill on map (2)	Post-Medieval to Modern

HER PrefRef	Easting	Northing	Type	Name	Description	Period
6098.1.0	399732	405955	Historic Building	Buckley (New) Mill	Marked on maps (1,2) as a woollen mill. The spinning mill building is late C19 and stone built. Lowered to 3 storeys and 7x3 bays wide.	Post-Medieval to Modern
6105.1.0	399409	404689	Historic Building	Wellington Mills	Marked on map (1) as a cotton mill. Original mill built in 1853, larger mill erected in 1861 and extended in 1926, closed down in 1932.	Post-Medieval to Modern
6107.1.0	399591.0144	405580.4942	Historic Building	Victoria Mill	Marked on map (1) as a woollen mill. Cotton mill built around 1861 by John Edward Platt.	Post-Medieval to Modern
6108.1.0	399655.1978	405513.1643	Historic Building	Alexandra Mill	Marked on maps (1,2) as a woollen mill. Built 1868 by Robert Stott and later sold.	Post-Medieval to Modern
6109.1.0	399729	405603	Historic Building	Spring Mill	Marked on maps (1,2) as a woollen mill. The spinning mill is mid-C19 and stone built with timber internal structure.	Post-Medieval to Modern
6342.1.0	397320	401199	Historic Building	Scout Mill (New Scout Mill)	Mentioned as a fulling mill c.1777, and as a cotton spinning mill from pre-1793 until 1935	Post-Medieval to Modern
751.2.0	397221	399751	Historic Building	Heyrod Hall	Site Type: A1. 2 hectares. House and grounds to the east of Wakefield Road. Reservoirs and the river Tame lie to the east, and open fields bound the site to the north. Heyrod Cottage and Hartshead Road lie to the south. The site is cut through on the western side by the London & North Western Railway. The drive leading from Wakefield Road over the bridge within the grounds gives access to the house. Productive garden and pleasure ground with walks and boundary belt. Extant. (1,2) The present hall is an undistinguished mid-19th-century building. It is a two-storey stone house, part of which is left empty, part still inhabited	Post-Medieval to Modern
9179.1.0	396766	399437	Historic Building	Woodfield (House and grounds)	1 hectare. House with grounds to the west of Wakefield Road, open fields on all other boundaries. Drive to the north-east of the site, productive garden beyond. Separate path system from Wakefield Road through pleasure ground dotted with trees.	Post-Medieval to Modern
3337.1.0	397569	399920	BLD	Spring Grove Mill	Marked on the map as a woollen mill. This site dates originally from around 1818. It was originally a water-powered, later steam-powered and finally electricity-powered cotton spinning and later woollen manufacturing mill. [It was the] last water-powered mill built in Stalybridge. Built by John Howard, a woollen manufacturer, but used at first for cotton spinning.	Post Medieval
644.1.0	397710	402060	BLD	Micklehurst Station (former)	The Diggle loop line on the east side of the valley, opened 1885, now closed, surviving building in station road of Middlehurst Station, closed to passengers 1907, goods 1962.This station was one of three along the now disused railway line from Stalybridge station to Upper Mill. The other stations were at Friezland and Millbrook. The line stayed open to through trains until September 1964 as it continued to serve Heyrod Power station	Post Medieval
13764.1.0	397789	402117	BLD	All Saints Church, Mossley (former)	A prominent landmark building within the Tame Valley. It is of mid-Victorian date, not a grand church, but it has a pleasant, rusticated charm in keeping with the townscape of Mossley. The tower, small architectural details such as the finials, and the roofing slates make the church an attractive local landmark	Post Medieval
17888.1.0	397690	401982	BLD	The New Bridge Inn	Detached three-storey stone-built property with arched windows with keystones to the third floor. Originally a beer house established c.1860.	Post Medieval
17902.1.0	397146	402687	BLD	51-51a Stockport Road	Former grain store and shop of two storeys plus attic. The building has been converted into two private dwellings. .	Post Medieval
17904.1.0	397302	402811	BLD	Westholme	Two-storey detached house built in stone with a slate roof. Built c.1860s.	Post Medieval
19049.1.0	399694	405707	BLD	NatWest Bank Building (former)	An impressive stone-built bank dating to the late 19th century and identified on the Ordnance Survey 1st Edition 1:2500 map of 1893	Post Medieval
19050.1.0	399737	405745	BLD	Globe Chambers	First identified on the Ordnance Survey 1st Edition 1:2500 map of 1893. Labelled as a public house on mapping from the early to mid-20th century. Today in use as a Business Centre, split between numerous businesses.	Post Medieval
19053.1.0	399784	405819	BLD	Uppermill Methodist Church	Methodist chapel, erected in 1912-13 as a replacement for an earlier chapel. A deed dated August 19th 1811 confirms that the original chapel on the site was built by public conscription. The chapel was described a ‘Churchwarden’s Gothic’ and ‘Ionic’; a simple, compact building. The church remains a place of worship and centre for numerous activities within the village.	Post Medieval

HER PrefRef	Easting	Northing	Type	Name	Description	Period
19054.1.0	399782	405847	BLD	Commercial Hotel	A detached, two-storey, stone-built public house displaying Georgian architecture. Built in c.1820 for a banker named James Buckley.	Post Medieval
479.1.0	397299	401299	Find Spot	Stone hammer (antiquarian find)	Dark grey stone hammer from Tame Valley, exhibited 1877.	Late Neo/Early BA
5903.1.0	399700	405599	Find Spot	Stone hammer (antiquarian find)	Small, dark grey stone hammer found by Mr Shaw in gravel alongside the river Tame near Uppermill Station. Exhibited in 1868. Neolithic - Bronze Age	Late Neolithic to Late Bronze Age
9003.1.0	399598	405251	Find Spot	Station Brow, Diggle (stone heads)	Two heads, one male, one female. Found behind wall at Churchill Playing Fields by Michael Openshaw & Paul Siddall (County School, Diggle), 31/01/86.	Medieval
9003.1.1	399151	404636	Find Spot	Station Brow (stone heads)	Two heads on corner house above doorway. Victorian, one male, one apparently female, wearing a ?hat. Rather weathered; near Churchill Playing Fields	Post-Medieval
9017.1.0	399629	405421	Find Spot	146 Carr Lane (stone head)	Two heads in house wall at 146 Carr Lane, over river bridge from High Street. Two heads (now missing) built into inside wall facing house (unusually), covered by thicket (usually head(s) face away from house). Possibly moved from elsewhere. House has haunting tradition. Heads missing by 1990. NB – there is no No.146 on Carr Lane – the first house over the bridge is No.136. The mapped location was in any case c.760m to the south-west of the bridge (at NGR SD 99 05). The GIS point has been moved to a position close to No.136 Carr Lane	Iron Age
1096.1.0	399750	406499	Monument	Barrow on Brown Hill (site of)	Possible barrow or flat cemetery was dug by quarrymen in May 1844 and its contents for the most part destroyed.	Bronze Age
11138.1.0	397335	401895	Monument	Tumbling Bank Mill (site of)	Located in the vicinity of Abney Congregational Church overlooking Manchester Road. Mill extant by 1793. No usage detailed until 1816 when John Buckley, cotton spinner, was listed at Tumbling Bank. No details exist for the mill, which was presumably water-powered at first until a steam-engine was installed in 1819	Post-Medieval
11140.1.0	396338	398505	Monument	Congregational Chapel (site of)	Formed part of the RCHME survey. Decorated Gothic with large gabled front divided by buttresses and twin-arched outer porch with date of 1861. By Poulton and Woodman. Replaced 1835 chapel.	Post-Medieval to Modern
11142.1.0	397486	401939	Monument	Paper Mill (site of)	Small water-powered mill stood near the later River Mill between the [river] Tame and Smith Hill. Extant by 1793, owned by Samuel Seel, a farmer and fulling miller, in 1810 and partly occupied by Thomas Dyson until c.1818. Owned by John Buckley in 1838 who leased the mill in 1839 to John Neild for 21 years when steam replaced water as the power source. Known as Paper Mill from 1839. Described as a cotton mill in 1863. Taken over by Robert Wilkinson in 1866 and by Samuel Dyson in 1872. Demolished prior to the construction of River Mill in 1889.	Post-Medieval
11225.1.0	396235	398494	Monument	Tame Foundry (site of)	The foundry site lies at the eastern end of the Castle Street Mill.	Post-Medieval to Modern
13851.1.0	399537	406556	Monument	Woolroad Canal Warehouse (site of)	Site of canal warehouse, shown on the OS maps from the 1854 1st edition 6".	Post-Medieval to Modern
16625.1.0	399503	406261	Monument	Mytholm Mill (site of)	Mytholm Mill was established as a fulling mill c.1780, when it was occupied by James Byrom. It was a woollen mill until about 1840, then a timber works until the 1880s. The outline of the mill dam, the mill race and the waterwheel pit are visible	Post-Medieval
174.1.0	399178	404691	Monument	Greenfield Station	At junction of LNWR [London North Western Railway] main line to Huddersfield with line from Oldham. Modernised, no buildings, wooden signal box at west, single-arch skewed stone bridge at east.	Post-Medieval to Modern
17442.1.0	397712	403497	Monument	Midge Hall (site of)	A small building identified as Midge Hall on the Ordnance Survey 1st edition 6":1 mile map of 1854. The same building footprint is shown on OS mapping for much of the 20th century, although it appears to have been cleared during the late 1970s/ early 1980s	Post-Medieval to Modern
17817.1.0	396806	398764	Monument	Huddersfield Narrow Canal: Knowl Canal Bridge	Stone-arched pedestrian bridge across canal, built c.1794 for Huddersfield Canal Company. Hammer-dressed stone. Elliptical arch and curved parapet walls which have round-topped coping stones and a stone band. Pathway across bridge laid in setts.	Post-Medieval to Modern

HER PrefRef	Easting	Northing	Type	Name	Description	Period
17818.1.0	397087	399038	Monument	Huddersfield Narrow Canal: boundary stone	Small boundary stone at side of towpath. Erected some time before 1882, when it is shown on OS mapping (an earlier map indicates a boundary post at this location). Approximately 30cm high. Letter ‘S’ inscribed on one side. Erected to mark a Parliamentary boundary	Post-Medieval to Modern
17819.1.0	397453	399798	Monument	Huddersfield Narrow Canal Lock No.8w	Canal lock originally built c.1794 for the Huddersfield Canal Company. Partly rebuilt by railway company in 1897. Infilled and buried during a period of canal closure. Excavated by HCS Restoration in 1996. The condition of the lock chamber was such that rebuilding was required. The sides were constructed with L-shaped pre-cast concrete sections 1m wide x 3m high, faced with engineering bricks to match the 1897 rebuild.	Post-Medieval to Modern
17820.1.0	397504	399930	Monument	Swing bridge (remains of)	Constructed c.1794, a swing bridge at Spring Grove providing access across the Huddersfield Narrow Canal between Heyrod and Grove Road, Millbrook. When the canal was closed the bridge was removed and a roadway was laid across the infilled canal channel. When this section of canal was being restored c.1996 a new box culvert bridge was built alongside. The base area of the former swing bridge was excavated and preserved. Visible remains include a stone-walled concave recess in which the bridge swung, iron central turntable pivot, and curved iron tracking.	Post-Medieval to Modern
17821.1.0	397508	400379	Monument	Huddersfield Narrow Canal Lock No.9w	Narrow canal lock built c.1794 with chamber approximately 72' long and 7' 3" wide. Difference in canal levels around 10' (3m). Stone construction with lock chamber walls in brick. Single gate at lock head; double gates at lock tail. Metal footbridge added at lock tail. Safety railings added to quadrants. Lock quadrant wall is curved on towpath side and squared on offside. Recess cut into chamber wall for lock ladder. Grooves for stop planks upstream of top gate. 'Pepper-pot' air vents above ground paddle sluices at upper end of lock. Below downstream lock gates, stone boatman’s steps lead down towards water on offside. Bywash overflow channel runs parallel on offside.	Post-Medieval to Modern
17822.1.0	397478	400497	Monument	Huddersfield Narrow Canal Lock No.11w	Narrow canal lock built c.1794 for Huddersfield Canal Company. Narrow canal lock with chamber approximately 72' long and 7' 3" wide. Difference in canal levels around 10' (3m). Stone construction with stone capping. Single gate at lock head; double gates at lock tail. Metal footbridge added at lock tail. Safety railings added to quadrants. Lock quadrant wall is curved on both towpath side and offside. Recess cut into chamber wall for lock ladder. Grooves for stop planks upstream of top gate. 'Pepper-pot' air vents above ground paddle sluices at upper end of lock. Below downstream lock gates, stone boatman’s steps lead down towards the water on both sides. Bywash overflow channel runs parallel on offside.	Post-Medieval to Modern
17823.1.0	397556	401272	Monument	Huddersfield Narrow Canal Lock No.12w	Narrow canal lock built c.1794 for Huddersfield Canal Company with some later reconstruction. Narrow canal lock with chamber approximately 72' long and 7' 3" wide. Difference in canal levels around 10' (3m). Brick construction with stone capping. Single gate at lock head; double gates at lock tail. Wooden footbridge added at lock tail. Recess cut into chamber wall for lock ladder. Grooves for stop planks upstream of top gate. Lock quadrant wall is curved on both towpath side and offside. 'Pepper-pot' air vents above ground paddle sluices at upper end of lock. Flow gauge on offside to measure lock usage. Below downstream lock gates, stone boatman’s steps lead down towards the water on offside. Bywash overflow channel runs parallel on offside	Post-Medieval to Modern
17910.1.0	397705	403733	Monument	County boundary stone (former)	One of several boundary stones that marked the boundary between Lancashire and Yorkshire. Erected in 1885 by the newly formed Mossley Borough Council. Top face says: 'Boundary'. Left face originally said: 'County of Lancashire Salford Hundred Borough of Mossley'. Right face originally said: 'County of Yorkshire West Riding'. As part of a Second World War initiative to confound prospective invaders, the words 'Lancashire', 'Salford', 'Mossley', 'Yorkshire' and 'West Riding' were chiselled off. All the boundary stones erected by Mossley Borough Council in 1885 have been similarly defaced.	Post-Medieval to Modern
17919.1.0	397991	403097	Monument	Huddersfield Narrow Canal Lock No.15w (Roaches Lock)	Narrow canal lock built c.1794 for Huddersfield Canal Company. Known as 'Roaches Lock'. Narrow canal lock with chamber approximately 72' long and 7' 3" wide. Difference in canal levels around 10' (3m). Stone construction with lock chamber walls in brick. Small brickwork patch in towpath-side quadrant. Single gate at lock head; double gates at lock tail. Wooden footbridge added at lock tail. Recess cut into chamber wall for lock ladder. Grooves for stop planks upstream of top gate. Lock quadrant wall is curved on both towpath side and offside. Safety railings added to quadrants as footpath crosses the lock via the footbridge. 'Pepper-pot' air vents above ground paddle sluices at upper end of lock. Below downstream lock gates, stone boatman’s steps lead down towards the water on offside. Bywash overflow channel runs parallel on offside.	Post-Medieval to Modern
17924.1.0	398116	403567	Monument	Huddersfield Narrow Canal Lock No.17w	Narrow canal lock built c.1794 for Huddersfield Canal Company. Narrow canal lock with chamber approximately 72' long and 7' 3" wide. Difference in canal levels around 10' (3m). Stone construction but one lock chamber wall rebuilt in brick. Single gate at lock head; double gates at lock tail. Wooden footbridge added at lock tail. Recess cut into chamber wall for lock ladder. Grooves for stop planks upstream of top gate. Lock quadrant wall is curved on towpath side, square on offside.	Post-Medieval to Modern

HER PrefRef	Easting	Northing	Type	Name	Description	Period
					'Pepper-pot' air vents above ground paddle sluices at upper end of lock. Below downstream lock gates, stone boatman's steps lead down towards the water on both sides, which would have enabled the boatman to get on or off the boat. Bywash overflow channel runs parallel on offside	
18952.1.0	397423.1424	403544.4938	Monument	Quick Quarry	A sandstone quarry marked on the Ordnance Survey 1st edition 1:10,560 map of 1854, with the same extent and detail shown on the 1st edition 1:2500 map of 1894 (1), although it is annotated as 'Quick Quarry'. It is marked 'Disused' on the 1:2500 map of 1955 (2). The quarry survives as a distinct feature of the local landscape.	Post-Medieval to Modern
18990.1.0	400954.5394	407867.7685	Monument	Diggle Mill Weir	A curved weir of stone block construction across the Diggle Brook. Formed part of the water-management system for Diggle Mill, rasping mill and corn mill.	Post-Medieval to Modern
18999.1.0	400700.8699	407880.1227	Monument	Diggle Bridge	Bridge over Diggle Brook. Parapet topped with large squared stones with keyed arch. From medieval times the route from Standedge to Saddleworth Church and Mottram in Longdendale would have crossed here. At Quarter Sessions 1774 the bridge was declared very narrow, ruinous and in decay. Saddleworth awarded £39 towards rebuilding.	Post-Medieval to Modern
19019.1.0	397532.4286	403697.5263	Monument	County boundary stone (former)	Prism-shaped stone: flat-backed with two sloping sides and triangular forward-sloping top. Set against a stone wall occupying a back-of-pavement location. One of several boundary stones that marked the boundary between Lancashire and Yorkshire. Erected in 1885 by the newly formed Mossley Borough Council. Top face says: 'Boundary'. Left face originally said: 'County of Yorkshire West Riding'. Right face originally said: 'County of Lancashire Salford Hundred Borough of Mossley'. As part of a Second World War initiative to confound prospective invaders, the words 'Lancashire', 'Salford', 'Mossley', 'Yorkshire' and 'West Riding' were chiselled off. All the boundary stones erected by Mossley Borough Council in 1885 have been similarly defaced. Located against the stone wall on the eastern side of Quick Road between Ash Lea and Quick House.	Post-Medieval to Modern
19045.1.0	399601.4897	405558.9624	Monument	K6 telephone kiosk	The K6 telephone kiosk, introduced in 1935 to celebrate the jubilee of King George V, designed by Sir Giles Gilbert Scott (1880–1960), is one of Britain's most recognisable pieces of industrial design and street furniture. Around 60,000 were installed between 1936 and 1968, so these are a familiar sight across the country. A fine example of a K6 telephone kiosk. Cast iron, painted red. Square kiosk with domed roof. Unperforated crowns to top panels and margin glazing to windows and door.	Post-Medieval to Modern
205.1.0	400677	407940	Monument	Kiln Green Aqueduct (Huddersfield Canal)	The Huddersfield Canal was diverted 1846-49 in connection with construction of a railway tunnel. On the old line a small section and remains of an aqueduct are visible opposite the school at Kiln Green.	Post-Medieval to Modern
237.1.0	400800	408119	Monument	Standedge Canal Tunnel	On the summit level of the Huddersfield Canal, the highest stretch of navigable water in the country. It is the longest canal tunnel in Britain. Originally 5,456 yds, but extended with the construction of platform for railway tunnels in 1893–94 to 5,698 yd. Opened April 1811, closed 1944. Maintained to drain railway tunnel – still navigable.	Post-Medieval to Modern
238.1.0	400769	408149	Monument	Standedge railway tunnels	Entrances immediately north of Diggle Station, closed 1963, on LNWR [London North Western Railway] Manchester–Huddersfield line. Longest railway tunnel in Britain, 3 miles 66 yd (4.89 km) until opening of Severn tunnel in 1886	Post-Medieval to Modern
3302.1.0	398120	403299	Monument	Union Mill (site of)	Marked on maps as a cotton mill. Late C19/early C20 spinning mill of 3 storeys and 4x3 bays. Brick built. Multi-ridge hipped slate roof.	Post-Medieval to Modern
3304.1.0	397479	401899	Monument	River Mill (South End No.3 Mill) (site of)	Mid-C19 stone-built spinning mill of 4 storeys (plus basement). Steam-powered cotton spinning mill that dates from around the mid-C19. Built by the firm of John Mayall in 1848. Rebuilt in 1889 and closed in 1931.	Post-Medieval to Modern
3308.1.0	397549	402149	Monument	Victoria Mills (site of)	Marked on both maps as a cotton mill.	Post-Medieval to Modern
3309.1.0	397509	402410	Monument	Mossley Brow Mill (Border Mill) (site of)	Marked on map (1) as a vacant site and on map (2) as a cotton mill. Originally built in 1873/74 by the Mossley Spinning Co. Ltd, and later taken over by the Border Spinning Co. It was taken over by the Mossley Wool & Spinning Co Ltd in 1933, along with Milton Mills.	Post-Medieval to Modern
3310.1.0	397609	402480	Monument	Milton Mills (site of)	Marked as a cotton mill (1). The spinning mill is late C19/early C20, of 5 storeys, 36x5 bays and a flat roof. Brick built. Built by the Milton Spinning Co Ltd on the site of the demolished Cheshire Side Mill in 1892.	Post-Medieval to Modern
3311.1.0	397612	402600	Monument	Carrhill Mill (Creswell Mill) (site of)	Marked on maps (1,2) as a cotton mill. Spinning mill is of 4 storeys (plus basement), of 10x4 bays. Brick built, late C19.	Post-Medieval to Modern

HER PrefRef	Easting	Northing	Type	Name	Description	Period
3377.1.0	397080	399300	Monument	River Meadow Mills (site of)	Marked on maps as a cotton mill (1,2,3). 1851 keystone to the mill. 4 storeys and 15x4 bays. Stone built, with a flat roof.	Post-Medieval to Modern
3377.3.0	396971	399297	Monument	Acres Bank (site of)	House with grounds in association with the River Meadow Mills [HER 3377.1.0]. Bounded by mills to the east, the river Tame to the south and open fields to the north.	Post-Medieval to Modern
5387.1.0	397883	402977	Monument	Roughtown Mill (site of)	The oldest known water-powered site in Mossley, dating to 1764 when a fulling mill was erected in Roughtown by John Andrew. A second fulling mill was added in 1769 and the scribbling process was added c.1781. A cotton mill was built in 1805 connected to the earliest mill. Powered by two waterwheels in 1815.	Post-Medieval to Modern
5792.1.0	396090	398679	Monument	Garside's Mill (site of)	Mentioned as a cotton spinning mill, in use c.1798 until 1826.	Post-Medieval
5793.1.0	396140	398549	Monument	Water Street Mill (site of)	Mentioned as a cotton spinning mill, in use from 1797 until c.1870s.	Post-Medieval
5794.1.0	396140	398630	Monument	Bayley's Mill/ Hope Mill (site of)	Mentioned as a cotton spinning mill, in use from c.1800 until 1857. The site is now occupied by a Job Centre.	Post-Medieval to Modern
5795.1.0	396147	398688	Monument	Queen Street Mill (site of)	Mentioned as a cotton spinning mill, in use from 1803 until 1881. Site now a car park, mill demolished.	Post-Medieval to Modern
5797.1.0	396199	398539	Monument	Adshead's Mill (site of)	Mentioned as a cotton spinning mill, in use from c.1795 until 1818.	Post-Medieval
5798.1.0	396239	398649	Monument	King Street Mill (site of)	Mentioned as a cotton spinning mill, in use from c.1800 until the 1870s. Now demolished (TAS 99).	Post-Medieval
5802.1.0	397239	399595	Monument	Heyrod Mill/ Hartshead Print Works (site of)	Mentioned as a cotton spinning mill, in use from c.1786 until 1848, and converted to a print works from 1848 until	Post-Medieval to Modern

5807.1.0	397549	401789	Monument	South End Mills (site of)	Mentioned as a cotton spinning mill from 1859–62 until 1930. Built by John Mayall in 1860. Stone built, 5 storeys.	Post-Medieval to Modern
5808.1.0	397504	402020	Monument	Bottoms Old Mill (site of)	Mentioned as a fulling mill c.1777 to c.1807 and as a cotton spinning mill c.1807–1931.	Post-Medieval to Modern
5809.1.0	398099	403480	Monument	Spring Mill (Una Mill) (site of)	Mentioned as a cotton spinning mill from 1861/2 until 1929.	Post-Medieval to Modern
6095.1.0	400815	408390	Monument	Harrop Court Mill (site of)	Marked on map as a woollen mill. Woollen scribbling mill built c.1800 and used for cotton spinning by John Hall & Co. 1861–75. Reverted to woollen manufacture until its closure in 1981	Post-Medieval to Modern
6244.1.0	400149	407244	Monument	Dobcross Loom Works (site of)	Famous textile machinery works started by Hutchinson & Hollingworth in 1861, making Dobcross woollen and worsted power looms with chain-operated mechanism for changing shuttles in weaving patterned cloths.	Post-Medieval to Modern
6335.1.0	398094	403219	Monument	Platt's Mill (site of)	Mentioned as a wool mill from c.1796 until 1829.	Post-Medieval
6337.1.0	397879	402920	Monument	Andrew Mill (site of)	Was a fulling mill from 1765 until 1871, and a cotton spinning mill from 1805 until 1960.	Post-Medieval to Modern
6339.1.0	397400	400590	Monument	Black Rock Mill (site of)	Mentioned as a wool mill from c.1781 until 1810, and as a cotton spinning mill from c.1810 until 1876.	Post-Medieval
6341.1.0	397899	402750	Monument	Stamford Mill (site of)	Mentioned as a cotton spinning mill from 1860–61 until 1960.	Post-Medieval to Modern
6343.1.0	397219	402521	Monument	Westhill Mill (former electricity substation) (site of)	Mentioned as a cotton spinning mill 1900–31. However, on the maps of 1910 & 1929 the building is described as an electricity substation.	Modern
6345.1.0	397499	401670	Monument	Albert Mill (site of)	Mentioned as a cotton spinning mill from 1860–61 until c.1960.	Post-Medieval to Modern

HER PrefRef	Easting	Northing	Type	Name	Description	Period
751.1.0	397192	399747	Monument	Heyrod Old Hall (site of)	Heyrod Hall was built close to the river Tame, north-east of Stalybridge. In the early 15th century the estate of Heyrod belonged to John del Heyrod, and there may have been a hall here at this time. Judging from a datestone of 1638, the old hall was built, or rebuilt, in the early 17th century. This hall was demolished in 1843, at the time of the construction of the railway which runs nearby.	Post Medieval
757.1.0	396560	398560	Monument	Staly Bridge	The bridge which gives its name to Stayley appears to have existed from an early date: it was in decay in 1621. It was repaired and existed till 1707 when a new one was erected.	Post-Medieval to Modern
3315.1.0	397800	401850	MON	Brunswick Mill (Victoria & Albert Mill) (site of)	Marked as a cotton mill. Late C19/ early C20. One of the larger Mossley Mills. Built by John Schofield and described as incomplete in a deed of 1853. Schofield died in 1859, but the mill continued in the family until 1875 when it passed to Edward & John Clementson. Burnt down in 1880. Brunswick Cotton Co formed in 1882 to rebuild the mill. Taken over again in 1933.The original mill was known as Ponge Mill, known to be in existence in 1793 but probably extant 8 years previously. Possibly a woollen mill.	Post Medieval
5791.1.0	396059	398520	MON	The Hen-cote (site of)	Mentioned as a cotton spinning mill, in use from c.1800 until c.1819. Mill demolished (TAS 99)	Post Medieval
6336.1.0	397679	401520	MON	Bottoms New Mill/ Bankside Mill (site of)	Mentioned as a wool mill from c.1829–31 until post-1872.	Post Medieval
6338.1.0	397769	401940	MON	New Hollins/ Victoria Mill (site of)	Mentioned as a cotton spinning mill from c.1829/31 until 1933, and as a woollen mill from 1933 until 1961	Post Medieval
636.1.0	397660	402020	MON	Croft Mill (site of)	Long four-storey stone-built cotton mill on east bank of Huddersfield Canal with internal engine house. Worked by Robert Hyde Buckley with Woodend Mill in late C19. In 1884 had 166,000 spindles and 450 looms. Mentioned as a cotton spinning mill from c.1838 until 1960.	Post Medieval
11224.1.0	396095	398436	MON	Caroline Street Methodist Chapel (site of)	First purpose-built Wesleyan chapel in Stalybridge. Built in 1815, enlarged in 1827 and rebuilt in 1872. The OS 60" maps of 1850 (2) and 1891/92 (3) show the chapel set within a burial ground. These maps also show that the chapel as rebuilt in 1872 was larger than its predecessor, the front elevation of which lay further back from Caroline Street. Chapel was demolished, site now used as a car park.	Post Medieval
3470.1.0	395999	398579	MON	Harrop Street Mill (site of)	Marked on the map as a cotton mill. Unusual plan.	Post Medieval
17913.1.0	397610	402819	Place	Roughtown Green	Small unenclosed park pleasantly situated on a steep hillside between Roughtown Road and New Earth Street. Mostly grass with a number of mature trees. Playground area has slide and swings.	Modern
3377.2.0	396987	399267	Place	Acres Bank (Park)	Site Type: A1, B. 2 hectares. Partial survival of the park belonging to Acres Bank house [HER 3377.3.0]. The park is clipped on the north-west corner by the London & North Western Railway.	Post-Medieval to Modern
3583.1.0	396300	398590	Place	Stalybridge village core	Burdett shows the settlement as a linear spread south of Ridge Hill, crossing the river Tame.	Medieval to Post Medieval

6254.1.0	397520	403749	Place	Quick settlement	1770: shows a group of buildings now named "Higher Quick Farm", also some further south, either side of the Stockport Road. 1851: the farm area is named "Hollingworth Quick", the main concentration of Quick to the south	Medieval to Post Medieval
6255.1.0	398599	404549	Place	Shaw Hall settlement	Shaw Hall is shown as a building on the Oldham Road	Medieval to Post Medieval
9174.1.0	397139	399827	Place	Rushfield (site of house and grounds)	Site Type: A1. 2 hectares. House with grounds to the west of Wakefield Road opposite Heyrod Hall. Open fields on all other boundaries.	Post-Medieval to Modern
6192.1.0	399750	405800	PLA	Uppermill settlement	1770: a group of buildings east of the river Tame, around the present High Street. 1851 OS map: as before, with much development including mills, the church, canal and railway.	Post Medieval
17826.1.0	397882	401371	PLA	Mossley Old Cemetery	A Victorian cemetery with chapels, lodge, entrance gates, pathways, lawns, flower beds and a garden of remembrance. There are a significant number of graves from the First World War.	Post Medieval
ATK1	396872	399360	Monument	Former Souracre Farm	Two extant structures remain on site comprising a farmhouse and barn belonging to Souracre Farm, both of which are in now in derelict condition.	Medieval

HER PrefRef	Easting	Northing	Type	Name	Description	Period
ATK2	396400	398469	Monument	Former Goods Station	Site was formerly used as Micklehurst Goods Station on the 'Micklehurst Loop', c. 1881-1966. The goods warehouse survives, encased by later sheds on three sides. Three-storey goods warehouse of blue engineering brick with modern roof covering.	Post Medieval

A.5 Historic Environment Record event data

HER UID	Easting	Northing	Name	Description
EGM3497	399726	405950	Buckley New Mill	Archaeological building survey of a textile mill complex originating in the 1820s, undertaken in fulfilment of a planning condition. There were four main phases to the site, spanning the period 1822/51 to the 1940s and including both fireproof and non-fireproof structures as well as the remains of a second-phase engine house and chimney and a warehouse.
EGM3516	399727	405599	Spring Mill	Building survey of a former woollen mill established c.1850, possibly on the site of an earlier waterpowered mill. The survey was undertaken in order to provide an analysis and understanding of the evolution and function of the building complex as part of the planning process, ahead of redevelopment.
EGM4222	396179	398478	Longlands Mill	A brief 'historical and archaeological guide' to a former cotton mill dating to 1805 was produced for Tameside MBC.
EGM4470	399396	404685	Knoll Mill	Strip and record exercise and an archaeological watching brief at a former mill site. The strip and record comprised the excavation and recording of a trench at the former location of the engine house, whilst the watching brief served to demonstrate the layout and some of the internal features of the earlier mill building, confirming and expanding the evidence of old maps of the site. The strip and record area was excavated under archaeological direction by a 360-degree tracked excavator. The watching brief area was observed archeologically. The 'turnover' work was carried out by a 360- degree tracked excavator using a toothed bucket. The size of the machine and the bucket used meant that close observation was often difficult for safety reasons and the remains were occasionally only seen after they had been removed or damaged.
EGM4472	397315	402088	Mossley Park Refurbishment	Heritage statement, produced to accompany a planning application for the refurbishment of Mossley Park. The intention of the report is to outline the proposed works and their effect on the character of the park. All proposed works have been sympathetically designed to fit in with the heritage and history of the hall using matching materials wherever possible. The proposal is divided into the following areas: removal of steps and concrete barriers; resurfacing the southern approach road; and resurfacing the bowling green car park.
EGM4823	396203	398483	Castle Street Mills and Tame Foundry	Evaluation undertaken in order to fulfil a condition attached to planning consent for redevelopment. A previous desk-based assessment had identified potential for surviving archaeological remains relating to the early/ mid-C19 Castle Street Mills complex, and the mid-C19 Tame Foundry. Four trial trenches were placed across the footprint of buildings of potential archaeological interest, specifically an engine house built in 1827 for the Castle Street Mills, and the main processing areas of the iron foundry. The trenches also aimed to elucidate further information on the power-transmission system from an engine hose added to the mill complex in the mid-C19. The archaeological remains uncovered within a trench across the footprint of the 1827 engine house were deemed to be of sufficient significance to merit further excavation. This exposed part of the original mill floor and the engine room with in-situ engine beds, together with part of a chimney. However, it was evident that much of the engine house's footprint, together with the associated boiler house, extended beyond the western boundary of the development site, and was thus not available for excavation. The other evaluation trenches uncovered remains of a late C19 or early C20 basement with a passage heading towards the front of a standing engine house for Castle Street Mills, although there was no firm evidence for an underground power shaft between the engine house and the site of the adjacent spinning block. The trenches placed across the Tame Foundry exposed fragmentary remains of several walls, drains and floor surfaces, but yielded little evidence for the iron-founding processes.
EGM5165	396173	398488	Castle Street Mills Engine House	Archaeological investigation which aimed to uncover and record the foundation beds and other fixtures and fittings associated with the mid-19th-century steam engine that occupied the detached engine house at a Grade II Listed former mill complex, in advance of redevelopment. Most of the mill complex was demolished in the early 2000s except for a substantial four-storey wing, outside of the

HER UID	Easting	Northing	Name	Description
				current development site, which was converted to residential use in 2009, and the engine house that forms the focus of the present planning and Listed Building Consent applications and archaeological investigation. During the investigation, a visual inspection of the surviving fabric did not identify any fixtures and fittings, whilst excavation within the footprint of the building demonstrated that the foundation beds for the engine had been removed completely in the C20. It is possible that the engine had been sold and that this sale included the foundation beds and all fixtures and fittings, leaving little physical trace of its original layout and configuration.
EGM5566	397051	399307	Stalybridge Battery Storage Facility	A heritage impact assessment setting out the potential significance of the below-ground archaeological remains and built heritage of a brownfield site on the fringe of Stalybridge. The site was ocupied previously by the 19th-century River Meadow Mills, which warrants further investigation in advance of development.
EGM5717	396203.1	398484	Castle Street Mill	A desk-based assessment of Castle Street Mill. The report concluded that the site has considerable potential to contain buried remains of high local, and potentially regional, importance, in particular, any surviving buried remains of an early 19th-century steam engine that powered part of the mill complex, together with below-ground structural elements of the 19th-century iron foundry.
EGM5747	397379	402126.3	Britannia Mill	A heritage assessment of Britannia Mill in Mossley that was prepared to support an application to demolish the remaining structures of the mill. The report provides an assessment of the existing building within its historic context, and an understanding of the surrounding area based on historical research and a rapid archaeological survey of the mill.
EGM3222	397566	399716	Stayley Hall: Dendrochronological sampling	Samples from the hall and cross wings suggested they are broadly contemporary, with a construction date of the mid-1550s. Two inserted doors in the western wall of the west wing provided felling dates of 1556 and 1563. The poor condition of the building restricted the timbers that could be accessed for the survey.

EGM4652	393042	404104	TransPennine Route West of Leeds	Desk-based assessment of the TransPennine Route West of Leeds in advance of proposed upgrade of TransPennine Railway route from Manchester to York and Selby. The aim of this report is to provide an assessment of the significance of the historic buildings and structures along this part of the route. Comprised of a gazetteer prepared using information supplied by Network Rail, site visits, archive research and desk-based analysis.

ANNEX B – DESK-BASED ASSESSMENT OF OFFLINE SCHEME AREAS

B1. PRINTWORKS WORKS MAIN COMPOUND

Location Printworks Road, Cocker Hill, Millbrook, Tameside, Greater Manchester SK15 3BD

NGR SJ 96848 99337

Land use and proposals

Current use: Rough pasture.

Proposals: Construction of the main compound at Printworks Road north of Stalybridge Tunnel, with upgrades to the existing road access.

Known archaeological remains and potential

The proposed compound area is shown as an agricultural field on historic maps. A stone is shown in the west of the site, near Wakefield Road; a well or spring is indicated in the west of the site, near the junction of Wakefield Road and Printworks Road.

The site was observed to slope steeply eastwards towards the railway line, with a level area towards the north, likely to result from tipping of spoil from excavation of the adjacent underbridge. The spring was observed to run into an area of marshy land towards to the east.

The site has experienced limited ground disturbance and has low potential for significant archaeological remains. It may contain remains associated with medieval or post-medieval farming, or with earlier periods.

Likely Scheme impacts

Converting the area into a compound would require vegetation clearance, ground levelling and drainage and construction of hardstanding. Vegetation clearance and groundworks may damage buried archaeological remains with shallower ground cover.

Embedded design mitigation should be considered to limit ground disturbance, e.g. limiting land-take, raft foundations, using existing routes for utilities runs. Further consultation will be undertaken with GMAAS to determine the scope and nature of any mitigation, if required, when further information is available about compound layout and establishment.

B2. PRINTWORKS ROAD OFFICE COMPOUND

Location Main Office Compound, Printworks Road, Cocker Hill, Millbrook, Tameside, Greater Manchester SK15 3BD

NGR SJ 96848 99337

Land use and proposals

Current use: Overgrown land including derelict buildings

Proposals: Construction of the office compound at Printworks Road north of Stalybridge Tunnel, with upgrades to the existing road access.

Known archaeological remains and potential

Within the site, historic mapping dating to the 19th and 20th centuries indicates the buildings and tracks of Souracre Farm. Two extant structures remain on site comprising a farmhouse and barn, both of which are in now in derelict condition. Due to their poor condition, the buildings are fenced off and not accessible.

The farmhouse is of stone construction and of post medieval date. It comprises a two-storey structure of two room plan, with outshut to the rear with catslide roof. The building is now roofless, but retains substantial purlins with possible evidence of chamfering. Brick-built chimneys of later 20th century date were present on the gables. The principal elevation faces east. Formed in two bays, this elevation formerly had multi-light mullioned windows which are now lost or concealed behind boarding. The entrance into the farmhouse is located in the south gable. Internally, a pegged timber partition was visible, and a pegged window frame was retained to the rear of the structure. To the right of the rear (west) elevation a small blocked stone window with arched head was visible at first floor level.

The barn is rectangular plan and of stone construction. It is roofless and ruinous. A full height opening was formerly present in the north elevation, however this has been infilled with squared stone blocks, to leave a smaller door opening, whilst a window opening was present to its right. The barn had been subject to several phases of alteration, including blocking and creation of new openings, and the addition of brick extensions to the north and south of the building. The interior of the building was not accessible.

Immediately north-east of the proposed compound location is Woodfield Farmhouse and cottages (MGM1423; 1000.1.0). This farm formed part of one of the oldest tenanted properties in the manor of Ashton and is first noted in documentary sources in 1422, and again in 1597–98. There was a stone-built range with a farmhouse and cottages, dating to the mid-17th to mid-18th century. The farmhouse was dismantled in 1990 with a view to re-erection. Both No.8 and No.9 have been de-listed following renovation and repair.

To the north of Woodfield Farmhouse and cottages was a 17th century aisled cruck-framed barn (MGM1424; 1000.1.1), which survived until 1990 when it was dismantled with a view to re-erection. Tree-ring analysis dated elements of the cruck frame to have been felled AD 1300–1310, and another, c. AD 1640, indicating a rebuild using two earlier frames.

To the north-west of the proposed compound location is Woodfield House and grounds (MGM10322; 9179.1.0).

East of the proposed compound location and east of the railway, is the site of River Meadow Mills (MGM4158), a cotton mill established in 1851, now demolished. To the south of the site of River Meadow Mills was Acres Bank (MGM4160) a 19th century house and grounds associated with the factory.

The site contains two extant but ruinous historic farm buildings of post medieval date. It has high potential for associated remains dating to the medieval and post-medieval periods. The site is at the southern end of a farming hamlet known to have been occupied since at least the 15th century. It has experienced limited development or ground disturbance, and there is potential for the good survival of intact archaeological deposits, possibly of low (local) or medium (regional) significance.

Likely Scheme impacts

Whilst proposals for compound establishment are not yet available, it is anticipated that this may require demolition of extant historic buildings, vegetation clearance and ground levelling, and groundworks. These works would result in impact to historic buildings and the truncation or removal of potential archaeological remains.

Archaeological mitigation works will be required in advance of development, including historic building recording and archaeological investigation. Further consultation will be undertaken with GMAAS to determine the scope and nature of such mitigation when further information is available about the compound layout and establishment.

B5. HEYROD HALL COMPOUND

Location Wakefield Road, Heyrod, Tameside, Greater Manchester, SK15 3BY

NGR SJ 97193 99744

Land use and proposals

Current use: Forms part of private garden of Heyrod Hall.

Proposals: Temporary site compound to support works to Heyrod Hall Overbridge (MVL 3/7), with associated earthworks and private access track upgrades.

Known archaeological remains and potential

To the east of the site is Heyrod Hall (751.2.0), a mid-19th-century two-storey stone building. This hall replaced an earlier building, recorded to have been demolished when the railway (751.1.0) was built in the 1840s.

The Heyrod estate belonged to John del Heyrod in the 15th century and may have included a hall at this location. Writing in 1827, James Butterworth described Heyrod Hall as an ancient estate, and the hall to have included a date stone inscribed R.W. 1638.

To the north is Heyrod Hall Overbridge (MVL3/7) (NHLE1449242), constructed in the mid-late 1840s by A S Jee for the Huddersfield & Manchester Railway. The railway was built in cutting to the west of Heyrod Hall, severing the hall from its grounds to the west, which were later developed with suburban housing.

There is moderate potential for archaeological remains relating to the development of Heyrod Hall in the medieval and post medieval periods to survive in this area.

Likely Scheme impacts

Proposals for compound establishment and access track upgrades are not yet available, it is anticipated that this may require vegetation clearance, ground levelling, and some limited groundworks. These works have the potential to result in the truncation or removal of potential archaeological remains associated with Heyrod Hall's medieval and post medieval history, which may be of low (local) or medium (regional) significance. Archaeological works may be required to mitigate this impact. Consultation will be undertaken with GMAAS to determine the scope and nature of any such mitigation when further information is available about the compound layout and establishment.

B3. WAKEFIELD ROAD PLANT ACCESS AND COMPOUND

Location Wakefield Road, Brushes, Millbrook, Tameside, Greater Manchester OL5 9QG

NGR SD 97326 00470

Land use and proposals

Current use: disused former railway sidings.

Proposals: Upgrade works to the existing vehicular access at Wakefield Road, and the creation of a compound area north of the Springbank Lane Overbridge (MVL3/9) and west of Mossley Wastewater Treatment Works.

Known archaeological remains and potential

No archaeological remains are known from within the boundary of the compound.

At the northern end of the proposed compound is the grade II listed Manchester Road Underbridge (MVL3/10) (NHLE 1452392), and to the south is the grade II listed Springbank Lane Overbridge (MVL3/9) (NHLE 1449241). Both were built in the mid-late 1840s to designs by A S Jee for the Huddersfield & Manchester Railway.

Approximately 50m to the south west of the compound site is Holly Cottage (grade II, NHLE 1309247) and approximately 75m to the south west is 14, 16 and 18 John Street (grade II, NHLE 1163008).

Historic mapping indicates that the area has been used as railway siding since the late 19th century. Since the removal of the sidings in the late 20th century the parcel of land has not been subject to development.

The compound area is considered to have limited archaeological potential, as it is located within a railway cutting and has been subject to previous levelling and construction of hardstanding.

Likely Scheme impacts

It is not anticipated that the Order Scheme will impact upon any significant archaeological remains or built heritage. No further mitigation.

B4. SCOUT TUNNEL SITE COMPOUNDS

Location Manchester Road, Mossley, Micklehurst, Tameside, Greater Manchester OL5 9AN

NGR SD 97385 02384

Land use and proposals

Current use: Woodland and hardstanding.

Scout West Ramp proposal: Compound, located to the west of the railway line - site compound with associated access and earthworks.

Scout West Laydown proposal: Compound: Laydown area and associated earthworks.

Known archaeological remains and potential

The proposed compound areas are located south of the Grade II listed Railway tunnel portal, MVL3/11 Scout Tunnel (south end) (NHLE 1452399) and north-west of Huddersfield Narrow Canal Lock No.12w (MGM20054; 17823.1.0), built c.1794 for Huddersfield Canal Company.

No heritage assets are recorded within the land parcels for Scout West Laydown area. Historic Ordnance Survey mapping does not depict any structures or notable features within these areas, save for a signal post and boundary stone within the Scout West Ramp area to the west of the Transpennine Route. This area was subject to major earthworks for the construction of Scout Tunnel in the mid-19th century, which is likely to have reduced the potential for survival of archaeological remains in this area. This area is therefore of limited archaeological potential.

To the east is the site of Scout Mill, a fulling mill dating to c. 1777 and a cotton mill from 1793 to 1935 (6342.1.0). It was reconfigured and became New Scout Mill, mapped in 1955 as producing candlewick bedspreads and quilts. The southern portion of this site is identified for use as a spoil point. This area is currently under hard standing and no features are visible, however historic mapping reveals an irregularly shaped structure to have formerly been located in the centre of the hardstanding, the function of which is unknown. It is possible that archaeological remains associated with the mill survive below the hard standing.

Further to the north-east is the Scout Tunnel North Entrance (NHLE 1309457), built between 1794 and 1797 for the Huddersfield Narrow Canal. There is no visual relationship between the canal tunnel and the site.

Likely Scheme impacts

It is not anticipated that establishment of Scout West Laydown area would impact upon any significant archaeological remains. No mitigation works.

If required, intrusive groundworks on the Scout West Ramp site may disturb potential archaeological remains associated with Scout Mill within the Order Scheme boundary, such

as mill leats. Depending on the existence, character and date of any surviving remains, they may be of low (local) or medium (regional) significance, due to their association with a sequence of relatively early industrial mill sites.

However, if existing hardstanding is retained and there are no intrusive groundworks, no archaeological mitigation works would be needed.

If the ramp site requires intrusive groundworks, it is anticipated that a staged programme of archaeological mitigation works may be required in advance of development. Further consultation will be undertaken with GMAAS to determine the scope and nature of any such mitigation when further information is available about the construction methodology.

B5. MANCHESTER ROAD, SCOUT WEST: SITE COMPOUND WORKS FOR SPOIL STORAGE

Location Manchester Road, Mossley, Micklehurst, Tameside, Greater Manchester OL5 9QN

NGR SD 97442 01232

Land use and proposals

Current use: Pasture land.

Proposed: Spoil point.

Known archaeological remains and potential

No heritage assets are recorded on the HER within this area. Historic Ordnance Survey mapping reveals a terrace of nine worker's houses formerly to have been located along the roadside within this parcel of land. These buildings are shown on historic maps from 1848 until the 1950s and are no longer extant. Buried archaeological remains associated with these structures such as foundations, utility runs and back-yard features may survive within the site.

To the west of the proposed spoil point is the Grade II listed Railway tunnel portal, MVL3/11 Scout Tunnel (south end) (NHLE 1452399) and to the south-east is the Huddersfield Narrow Canal Lock No.12w (MGM20054; 17823.1.0), built c.1794 for Huddersfield Canal Company. To the north-west is the Scout Tunnel North Entrance (NHLE 1309457), built between 1794 and 1797.

To the west is the former site of Scout Mill, a fulling mill dating to c. 1777 and a cotton mill from 1793 to 1935 (HGM42438; MGM7397). It was reconfigured and became New Scout Mill, mapped in 1955 as producing candlewick bedspreads and quilts. These assets are all located outside the proposed spoil point. There is no map evidence for any leats or conduits leading from the Tame to Scout Mill in this location.

Likely scheme impacts

If required, intrusive groundworks on the Scout West Spoil Hold site may disturb potential surviving archaeological remains associated with terraced houses formerly located within the Order Scheme boundary. Any such remains are likely to be of low significance and may not require archaeological mitigation. Any remains associated with the 18th and 19th century Scout Mills and mill leats may be of local or regional significance. Depending on impacts, a programme of archaeological fieldwork may be required. Consultation will be undertaken with GMAAS in due course to determine the scope and nature of any such mitigation when further information is available about the compound layout and establishment.

B6. SCOUT EAST RAMP WORKS

Location Mossley, Manchester Road / opposite Egmont Street, Manchester Road, Mossley OL5 9LZ

NGR SD 97349 01503

Land use and proposals

Current use: Woodland, trackways and paths. Steep embankment down to railway.

Proposals: Trackside access.

Known archaeological remains and potential

No archaeological remains are known from within this location. Historic mapping indicates that land near the proposed works areas were used as reservoirs in the 19th century, but were disused by 1896. The outlines of these reservoirs are still visible as earthworks and cropmarks on satellite imagery. By the 1950s, the northeastern part of the area was used as allotment gardens.

Potential Scheme impacts

It is not anticipated that establishment of Scout East Ramp Works would impact upon any significant archaeological remains. No mitigation works.

B7. PLEVINS SITE COMPOUND WORKS

Location Plevin Mossley Depot Land South of Crown Hill, Mossley OL5 9NZ

NGR SD 97753 01507

Land use and proposals

Current use: Disused former light industrial site, including large sheds and historic brick building. The buildings were not accessible internally during the site inspection.

Proposals: Main site compound involving substantial demolition of existing commercial buildings.

Known archaeological remains and potential

The compound site is occupied by a former goods station warehouse, dating from the later 19th century, later industrial sheds and large areas of hardstanding.

This was formerly the site of Micklehurst Goods Station, constructed to serve the Micklehurst Loop. This line was constructed from 1881-85 to provide additional railway capacity and relieve congestion on the Transpennine Route, running to the east of Tame Valley between Stalybridge and Diggle. Shown as undeveloped land on the 1st edition Ordnance Survey maps of the mid,19th century, the goods station is first shown on the Ordnance Survey Town Plan map published in 1892, when it is shown to have included a goods warehouse, extending across two railway lines, sidings, cranes and a coal depot to the north. The Micklehurst Loop was closed in 1966, with the goods yard being converted to commercial use, with clearance of the railway lines and sidings and construction of modern light industrial sheds.

The goods warehouse survives, encased by the later sheds to the north, south and west. Construction is in blue engineering brick with a modern roof covering. The building is of three storeys, with a tall ground floor, and two shallower upper floors. The principal (east) elevation contains loading bays in the outer and central bays of the ground floor, flanked by blind windows at ground-floor level. Loading doors are present at first and second floor level in the central bay, the projecting lucam house shown on historic photos of the warehouse is , however, now lost. Paired segmental headed windows are present at first and second floor level, with original metal-framed multi-pane glazing with hopper openings retained to the second floor. This elevation has been subject to alteration including the insertion of fire escape doors to the left of the elevation, and loss of the timber canopy and central two-storey lucam house. Architectural detailed included the presence of brick dentils above ground floor openings and kneelers to the central loading doors. The remaining elevations are concealed by later buildings. Where visible, the warehouse was seen to survive within these later structures, and appeared to retain some original glazing and a broad opening in the north elevation which formerly accommodated railway tracks.

The remainder of the compound site was under concrete surfacing, with a sett surface retained to the entrance road to the site from Cheshire Street. There is potential for cobbled

surfaces to survive under concrete across the site. No other historic features were visible during the site inspection.

There are some non-designated assets associated in the vicinity of this compound site. These are site of Bottoms New Mill/Bankside Mill (6336.1.0) approximately 42m east of the compound on the western side of the Huddersfield Narrow Canal, Huddersfield Narrow Canal Lock No. 12w (17823.1.0) approximately 55m to the south west, and Mossley Old Cemetery (17826.1.0) approximately 66m to the east of the compound site.

Likely Scheme impacts

Details of the works required to create the compound are not currently available. Using the precautionary principle it is therefore assumed that demolition of all structures on site may be undertaken, alongside vegetation clearance and ground works. This would result in loss of the historic goods warehouse and truncation or removal of potential surviving archaeological remains associated with the good station.

It is likely that a staged programme of archaeological mitigation works would be required in advance of development, including historic building recording of the goods warehouse. Further consultation will be undertaken with GMAAS to determine the scope and nature of mitigation when further information is available about the compound layout and establishment.

B8. EGMONT STREET COMPOUND

Location Land west of Egmont Street, Mossley OL5 9NB

NGR SD 97511 01733

Land use and proposals

Current use: Disused brownfield site with hardstanding and scrub.

Proposed: Construction compound requiring temporary signalisation to allow HGV movements.

Known archaeological remains and potential

Located west of King George Park, the River Tame and the Huddersfield Canal. Northeast of Huddersfield Narrow Canal Lock No.12w (HER MGM20054/17823.1.0).

Site covers part of the site of the former Albert Mill, including areas of former structures (HER MGM7400/6345.1.0). Albert Mill was established as a cotton spinning mill in 1860 by Robert Buckley and was a five storey stone-built mill. Further mills of five and three storeys were constructed to the east and south respectively in 1867. Comparison of historic Ordnance Survey mapping indicates the original mill building to have been located to the north of the site, with later additions located towards Egmont Road. Within the Order Scheme boundary, the 1890s Ordnance Survey Town Plan shows a detached building to have been located within the Order Scheme boundary, with chimney and tank located to its north, suggesting this to have been the boiler house. Historic photographs held by Tameside Metropolitan Borough Council show this to have been a plain single, storey structure, in contrast to the multi storey mill buildings to the north and west. Part of the eastern mill block also falls within the Order Scheme boundary.

Albert Mill, Micklehurst was owned by the Brunswick Cotton Spinning Co, Limited in 1891. In 1919 Brunswick was acquired by a consortium led by Alexander Young of the Northern Coates Spinning Co, Wigan, and W. H. Heywood of Huddersfield (Grace's Guide). The mill fell out of use in 1933 before demolition in the 1950s. The majority of the mill site has been redeveloped with light industrial premises, however the area within the Order Scheme boundary remains as hard standing.

North of the Tame is the site of the former South End Mills (HER MGM6846/5807.1.0).

Buried remains of the 19th century Albert Mill may survive beneath areas of modern hardstanding. The site is assessed as having moderate archaeological potential.

Likely scheme impacts

If required, intrusive groundworks and vegetation clearance may disturb potential surviving archaeological remains of Albert Mill within the Order Scheme boundary. However, if existing hardstanding is retained and there are no intrusive groundworks, no archaeological mitigation works would be needed.

If the compound requires intrusive groundworks, it is anticipated that a staged programme of archaeological mitigation works may be required in advance of development, to investigate potential archaeological remains of low or medium significance. Further consultation will be undertaken with GMAAS to determine the scope and nature of any such mitigation when further information is available about compound layout and establishment.

B9. RELOCATED MOSSLEY STATION WEST SITE COMPOUND

Location A635 Manchester Road Manchester Road, Mossley Cross, Mossley, Micklehurst, Tameside, Greater Manchester OL5 9AN

NGR SD 97387 02384

Land use and proposals

Current use: Scrub land, woodland and rough grassland.

Proposed: Site compound with new access on the western side of the Mossley Station relocation site.

Known archaeological remains and potential

Mossley underwent rapid transformation in the early 20th century due to industrialisation, shown by the construction of Spring Cottage (2180.1.0) in 1822 c.75 m north-west of the compound location, a Unitarian Church (10426.1.0) in 1852, c.141 m west of the compound location, and Mount Gambier, a pair of stone-built, semi-detached houses built in 1871 (17918.1.0) located c. 35 m west of the compound location, as well as with the construction of the canal and the railway. Historic mapping reveals the proposed compound to have been used as railway sidings, as well as allotment gardens. This area was observed to have been used for dumping and now covered in shrubs and young trees.

Potential for significant archaeological remains within this area is assessed as low.

Likely Scheme impacts

Converting the area into a compound would require vegetation clearance and ground levelling. It is not anticipated that these works would impact upon any significant archaeological or built heritage remains. No mitigation works are anticipated.

B10 MOSSLEY STATION RELOCATION WORKS

Location: Manchester Road, Mossley Cross, Mossley, Tameside, Greater Manchester, OL5 9AN

NGR: SD 97378 02478

Land use and proposals

Current use: former railway sidings, used as depot / storage area

Proposals: Site compound with access widening onto Manchester Road. The site will then be developed

This site will then be developed for the relocated Mossley Station. The works include a new access layout, station building, parking area, footbridge, and lift shafts.

Known archaeological remains and potential

Mossley underwent rapid transformation in the early 20th century due to industrialisation, with the development of several mills to the east of the site (Mossley Brow (3309.1.0) 80 m to the east and Milton Mills (3310.1.0) 175 m to the east), the canal and the railway. Historic maps indicate that the north-eastern area of the site was occupied by a coal depot from the late-19th to mid-20th century with coal chutes now partially demolished and backfilled with made ground.

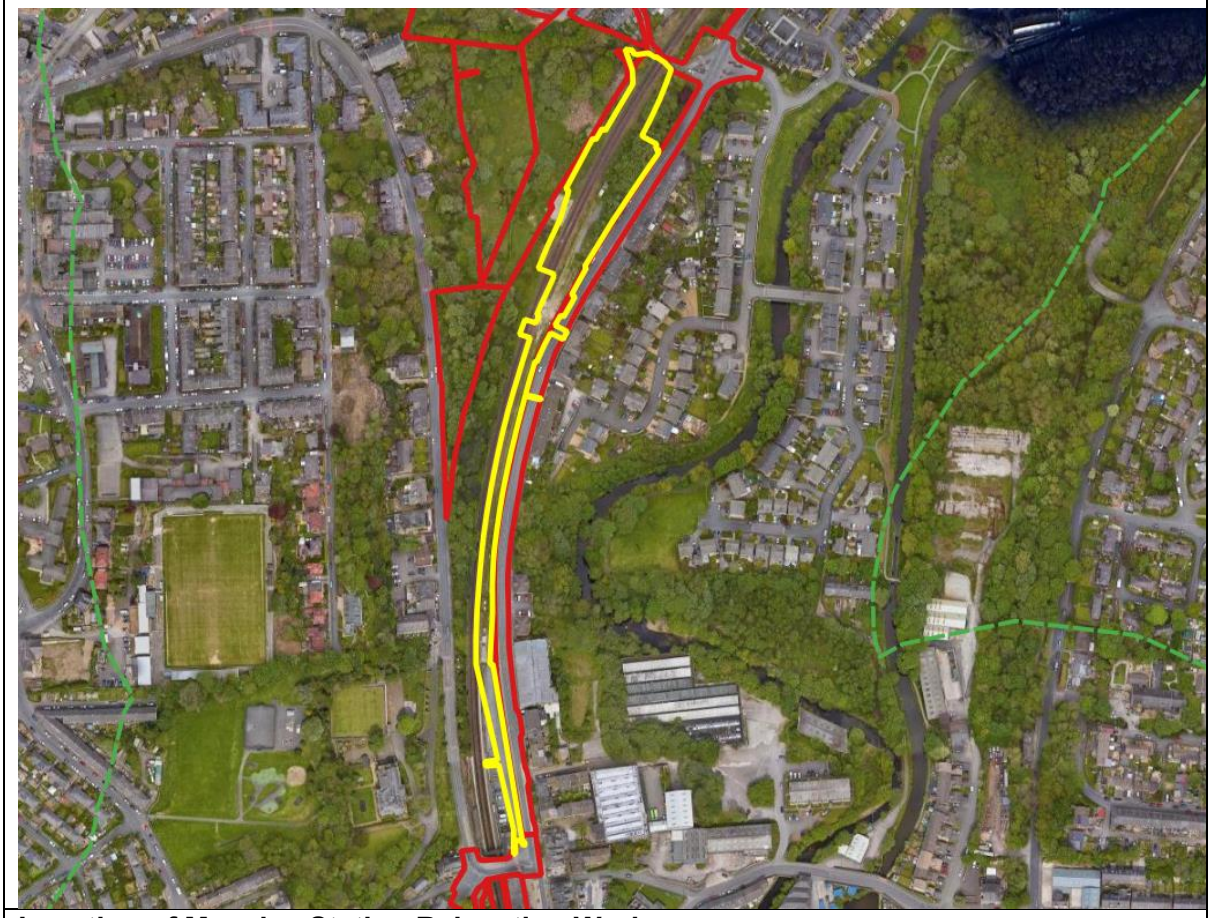
The area is bounded to the east by a wall fronting Manchester Road which may be contemporary with the construction of the railway including a substantial pair of ashlar gateposts. These structures are not listed but may be historically significant due to their potential association with A. S. Jee's railway architecture. Within the former sidings cobbled surfaces and rails survive. Towards the south of this area, the boundary wall to Manchester Road contains a blocked arch leading under the carriageway which formerly provided access to the mills to the east of Manchester Road, enabling raw and manufactured goods to be easily transferred between he mills and railway network.

It is assessed that the site has moderate potential for remains of low significance associated with the railway sidings, and low potential for remains of other periods. The previous works on the site associated with the construction of the railway is likely to have removed any pre-railway remains.

Likely Scheme impacts

The Order Scheme will involve the removal of elements of the surrounding stone walls and gateposts fronting Manchester Road. Construction works will include construction of a new station building, car parks, and a road-rail access point which would remove surviving historic surfaces within the compound. There will be no impact to the blocked arch to the south of the area.

A scheme of historic building recording is recommended to document the existing form and condition of the boundary wall, gateposts and historic surfaces within this compound, prior to compound establishment and construction of the Order Scheme. Further consultation will be undertaken with GMAAS to determine the scope and nature of mitigation when further information is available about the compound layout and establishment.



Location of Mossley Station Relocation Works.

Retaining wall fronting Manchester Road, March 2025.

B11. NEW EARTH STREET COMPOUND

Location Milton View, Mossley, Micklehurst, Tameside, Greater Manchester OL5 0SX

NGR SD 97571 02716

Land use and proposals

Current use: Area of unused land adjacent to terraced houses.

Proposals: Laydown area for materials to support bridge works. No earthworks required.

Known archaeological remains and potential

No heritage assets are recorded within this compound. Historic Ordnance Survey maps show this to have been undeveloped land, adjacent to a terrace of worker's housing and the railway cutting. The land slopes steeply from New Earth Street to the railway, and from the railway towards Manchester Road.

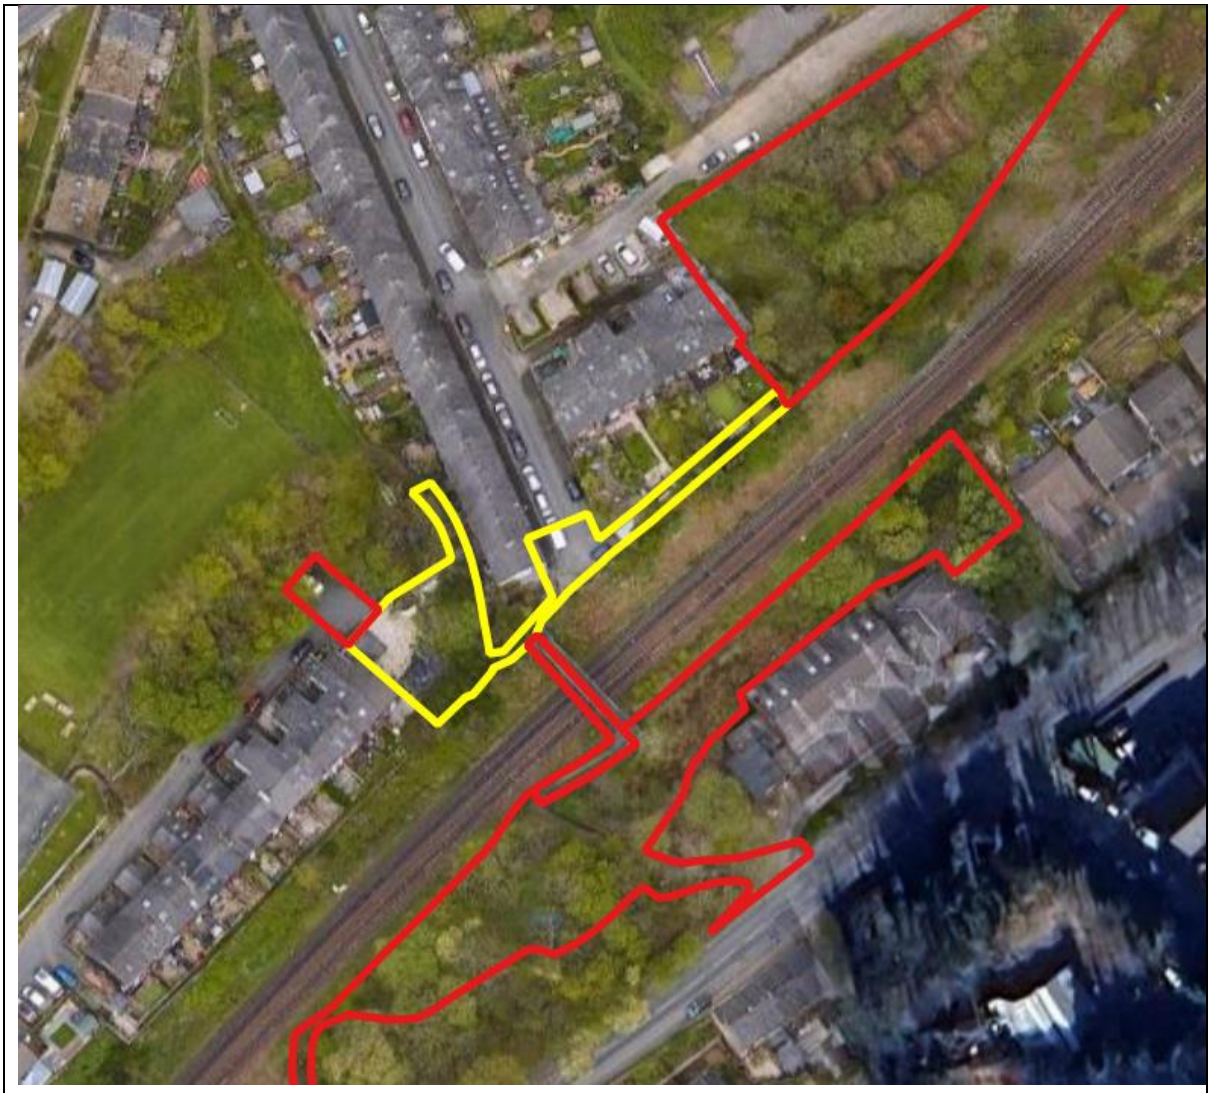
The compound site is located to the west of New Earth Footbridge (MVL3/16) and the former site of Drill Hall (17912.1.0), built in 1912, now clubhouse of the Tameside Sports Association. Woodend Mill (grade II listed, NHLE 1268030) and the former site of Carrhill Mill (3311.1.0), a water-powered woollen scribbling mill from 1793 which evolved into a steam-powered cotton spinning mill by 1818, are located to the east of the railway line from the compound.

The potential for significant archaeological remains to be present within this area is assessed to be low.

Likely scheme impacts

Converting the area into a compound would require vegetation clearance and ground levelling.

It is not anticipated that these works would impact upon any significant archaeological or built heritage remains. No mitigation works are anticipated.



Location of proposed compound. Base Map: GoogleEarth 2025

B12. ROUGHTOWN ROAD OVERBRIDGE (MVL3/17) WORKS

Location Roughtown Road, Mossley, Micklehurst, Tameside, Greater Manchester, OL5 0SR

NGR SD 97693 02839

Land use and proposals

Current use: The southwestern extent of the area has temporary fencing and some works have been undertaken within it. Land slopes steeply down to the railway cutting.

Proposals: Temporary working area.

Known archaeological remains and potential

The railway cutting is crossed by Roughtown Road Railway Overbridge (MVL3/17; NHLE 1452405, grade II listed) and a footbridge (MVL3/18) with riveted wrought iron girders with cross-braced panels spanning the railway, which rest on masonry abutments and date to the construction of the Huddersfield & Manchester Railway (1845-9).

Historic mapping show signal posts west of the railway line, on the steep embankment east of New earth Street (OS map published in 1911). Tanks and a signal post are shown on the map published in 1922. Historic maps indicate that the area to the west was formerly occupied by allotment gardens, noted on maps into the 1950s. Glasshouses and a spring are shown on the plot. To the north of the compound area is Roughtown Green, currently a children’s play area.

Given steepness of the embankment, previous land use for minor railway structures and as an allotment, archaeological potential is assessed as low.

Likely Scheme impacts

Converting the area into a compound would require vegetation clearance and ground levelling.

It is not anticipated that these works would impact upon any significant archaeological or built heritage remains. The grade II listed Roughtown Road Railway Overbridge (MVL3/17) will be protected via construction controls set out in the CoCP. No archaeological mitigation works are anticipated.

B11. HERON LANE COMPOUND

Location: Heron Lane, Mossley

NGR: SD 97877 03547

Land use and proposals

Current use: Pasture land.

Proposals: Site compound with works to Heron Lane to create passing places and a parking area.

Known archaeological remains and potential

There are no known heritage assets recorded within the compound boundary.

On the north western extent, the compound is near Wright's Mill Overbridge (MVL3/20), a grade II listed railway bridge constructed for the Huddersfield & Manchester Railway. There are two online non-designated heritage assets near the compound site, Midge Hall Underbridge (MVL3/19), an altered mid-19th century underbridge, located approximately 10m to the west of the compound boundary, and MVL3/21, a much altered water trough, located approximately 50m to the north of the compound area. The non-designated asset of Wright Mill (6045.1.0) is located approximately 55m to the north-east of the compound boundary. Constructed as a woollen mill in the early 19th century, only the mill building now survives, converted for residential use. Faint traces of ploughed out ridge and furrow were observed in pasture fields to the west of the railway line, indicating historic agricultural use in this area.

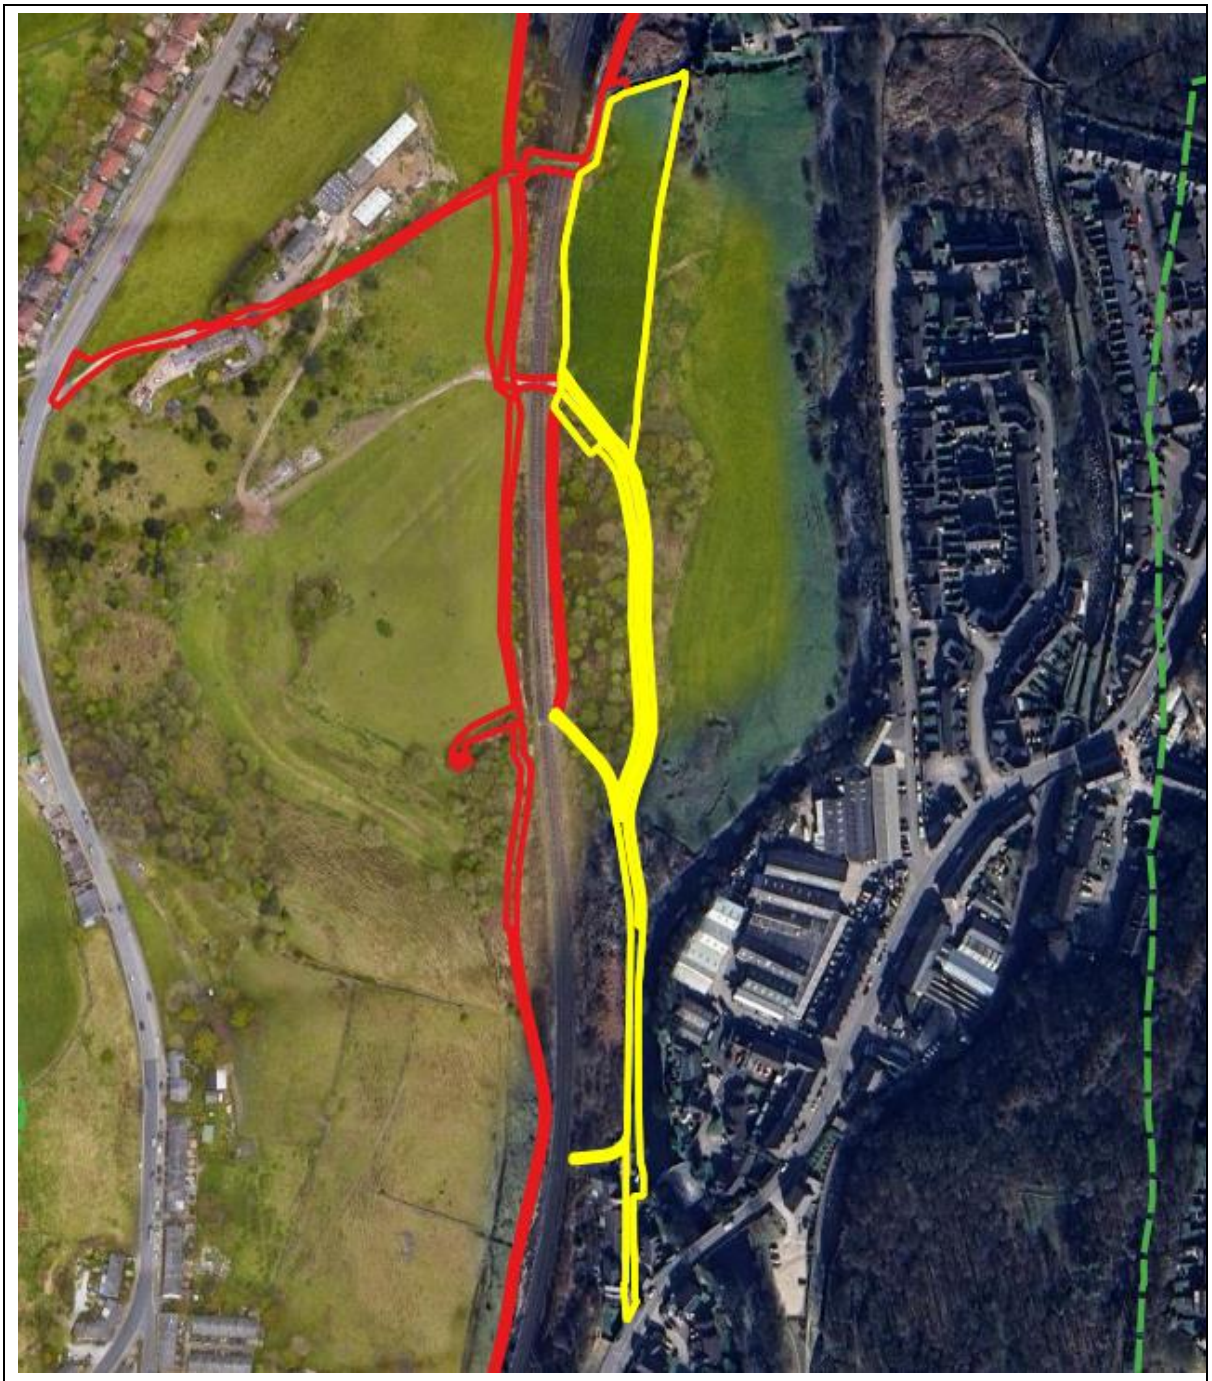
Historic maps show that the area has remained open fields since it was illustrated on the 1st edition 6" Ordnance Survey map of 1854. Local toponym 'Roaches' may derive from ME/OFr *rocher,* a steep rocky bank.

Low potential for presence of significant archaeological remains.

Likely Scheme impacts

Converting the area into a compound would require vegetation clearance and ground levelling.

It is not anticipated that these works would impact upon any significant archaeological or built heritage remains. No mitigation works.



Location of proposed compound. Base Map: GoogleEarth 2025

B12. ARMIT ROAD COMPOUND

Location Armit Road, Saddleworth, Grasscroft Oldham, Greater Manchester OL3 7LA

NGR SD 98108 03966

Land use and proposals

Current use: Pasture.

Proposals: Site compound and associated earthworks.

Known archaeological remains and potential

There are no heritage assets recorded within the compound boundary.

To the west of the compound are Hobbe Hole Underbridge (MVL3/22) (approximately 90m to the west) and grade II listed Wright's Overbridge (MVL3/23) (NHLE 1452409), located approximately 100m to the north. There is one non-designated asset located approximately 100m to the east which is canal lock 18W on Huddersfield Narrow Canal (19033.1.0).

In the 25 inch OS map published in 1894, Lower Grove Cotton Mill is located in a plot to the northwest of the proposed compound site. The mill was removed in the mid to late 20th century, and the area has not been developed subsequently. Map evidence does not indicate that this complex extended to the south of Armit Road and into the area of the compound.

There is low potential for significant buried archaeological remains to be present within this area.

Likely Scheme impacts

It is not anticipated that the Order Scheme will impact upon any significant archaeological or built heritage remains. No mitigation works.

B13. STOCKPORT ROAD LEVEL CROSSING DIVERSION

Location Mossley Road, Grotton, Saddleworth, Grasscroft, Oldham, Greater Manchester, OL5 0RS

NGR SD 97831 03595

Land use and proposals

Current use: Pasture, with fenced trackway adjacent to railway sidings.

Proposals: 10x100m strip - Temporary land take for fencing works

Known archaeological remains and potential

The Historic Environment Record does not record any archaeological remains within this site. To the north-east of the site is the grade II listed Wright's Mill Overbridge (MVL3/20). To the southeast is the non-designated Midge Hall semi-circular arch underbridge (MVL3/19). Both are associated within the Huddersfield & Manchester Railway (1845-9). Up hill to the north-west of the site are the grade II listed 7, 9, 11 AND 11A, Midge Hill (NHLE 1162827), three houses dating to the mid to late 18th century.

Historic maps depict a structure to the southwest of the compound, indicated on maps from c.1882 until the 1960s. The structure was located close to a well in the field to the south; it is no longer extant, but a rubble spread is visible on satellite images. Satellite imagery appears to show linear earthworks in the field to the south, aligned on a NE/SW axis; these broadly align with former field boundaries shown on historic maps.

Likely Scheme impacts

It is not anticipated that the Order Scheme will impact upon any significant archaeological or built heritage remains within this small area of pasture land immediately west of the railway. No mitigation works.

B14. ROYAL GEORGE UNDERBRIDGE (MVL3/25) AND SITE COMPOUND WORKS

Location Oaklands Road, Saddleworth. Grasscroft. Oldham, Greater Manchester OL4 4AE

NGR SD98602 04356

Land use and proposals

Current use: Surfaced car park.

Proposals: Compound and parking to support of the works to Royal George Underbridge (MVL3/25).

Known archaeological remains and potential

There are no recorded heritage assets within the compound boundary.

Three grade II designated heritage assets are located around the proposed compound. These are Royal George Underbridge (MVL3/25) (NHLE 1451848) approximately 30 m to the north, Christ Church Friezland (NHLE 1356701) approximately 100 m to the west, and Huddersfield Narrow Canal Milestone at SD 987 043 (NHLE 1253529). The closest non-designated heritage asset comprises Shaw Hall settlement (6255.1.0) which is of medieval and post medieval origin, and located c.185 m to the north of the proposed compound.

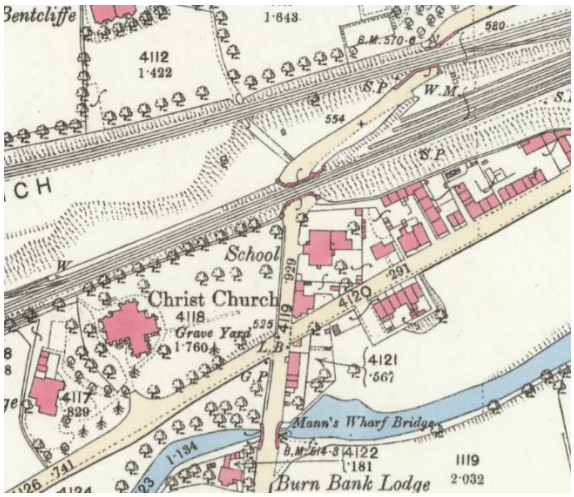
A school is depicted on the 1st edition Ordnance Survey map of 1854 located on the site of the current church hall and extending into the proposed compound. The school is named as Christ Church School on this map, and was associated with the adjacent church. The school was replaced by the mid-20th century by the current single storey church hall. Hard standing is now present to the south of the church hall and the proposed compound is currently used for car parking.

There is potential for archaeological remains of the former school to survive within the compound site, however, any such remains would be of low (local) significance.

Likely Scheme impacts

It is not anticipated that the Order Scheme will impact upon any significant archaeological or built heritage remains, as no ground disturbance is involved. No mitigation works.

Location of proposed compound. Base Map: GoogleEarth 2025



OS 25" Lancashire XCVII.12. Surveyed 1890 to 1891, Published 1894. Source: National Library of Scotland

B15. OAKLANDS ROAD COMPOUND

Location Oaklands Road, Saddleworth, Grasscroft, Oldham, Greater Manchester OL4 4EQ

NGR SD 98690 04451

Land use and proposals

Current use: Wooded land.

Proposals: Track access and welfare compound.

Known archaeological remains and potential

There are no heritage assets recorded within the compound boundary.

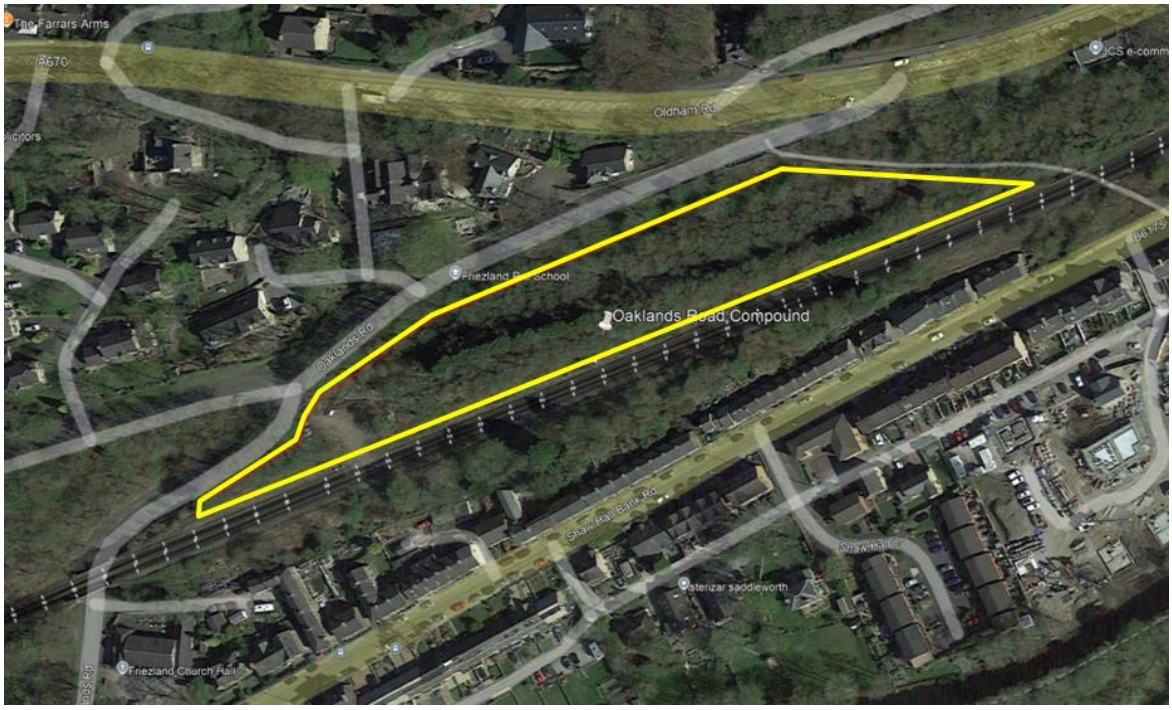
40m to the east of the compound boundary is Shaw Hall Bank Road Footway (MVL3/26) (NHLE 1451852), and to the immediate west is Royal George Underbridge (MVL3/25) (NHLE 1451848). Further to the south-west is Christ Church Friezland (grade II, NHLE 1356701).

The Oldham branch of the LNWR ran east-west across this area, following its opening in 1856, with sidings subsequently laid out between the Oldham branch and the Huddersfield & Manchester Railway. However when the Oldham Branch was disused in the later 20th century, railway equipment is likely to have been removed and the area is now overgrown with vegetation.

There is a low potential for any ground disturbance to identify archaeological remains associated with these former railway sidings and railway activity.

Likely Scheme impacts

It is not anticipated that the Order Scheme will impact upon any significant archaeological or built heritage. No mitigation works.



Location of proposed compound. Base Map: GoogleEarth 2025

B16. GREENFIELD SITE COMPOUND WORKS

LOCATION Greenfield, Oldham Road / Greenfield Station, Oldham Road, Saddleworth, Uppermill, Oldham, Greater Manchester OL3 6LU

NGR SD 99247 04771

Land use and proposals

Current use: Public highway, wooded land.

Proposals: Oldham Road to be closed during works to be used as a site compound. Wooded land to east of Oldham Road is to be used for utilities diversions.

Known archaeological remains and potential

The proposed compound is located to the immediate north-west of Oldham Road Overbridge (MVL3/28, NHLE 1451853), and non-designated assets including Greenfield Station Footbridge (MVL3/27A), and Greenfield Station (174.1.0). This area comprises the public highway of Oldham Road.

The proposed compound location has historically been enclosed by the Huddersfield and Manchester Railway to the west and the Oldham Road to the east. No development is shown to have been established within the compound boundary on historic maps. Historic maps dating back to 1854 show rough ground to the east of Oldham Road, with woodland between Chapel Road and the Huddersfield Narrow Canal.

There is low potential for buried archaeology to be located within this area.

Likely Scheme impacts

Establishment of the compound will not impact upon any significant archaeological or built heritage remains. No mitigation works.

Location of proposed compound. Base Map: GoogleEarth 2025

B17. WICKENS UNDERBRIDGE MVL3/29 LAYDOWN AREA & PROW UPGRADE

Location Ladcastle Road, Saddleworth, Uppermill, Oldham, Greater Manchester, OL3 6LU

NGR SD 99264 04769

Land use and proposals

Current use: Pasture, with wooded areas to north. Located west of railway.

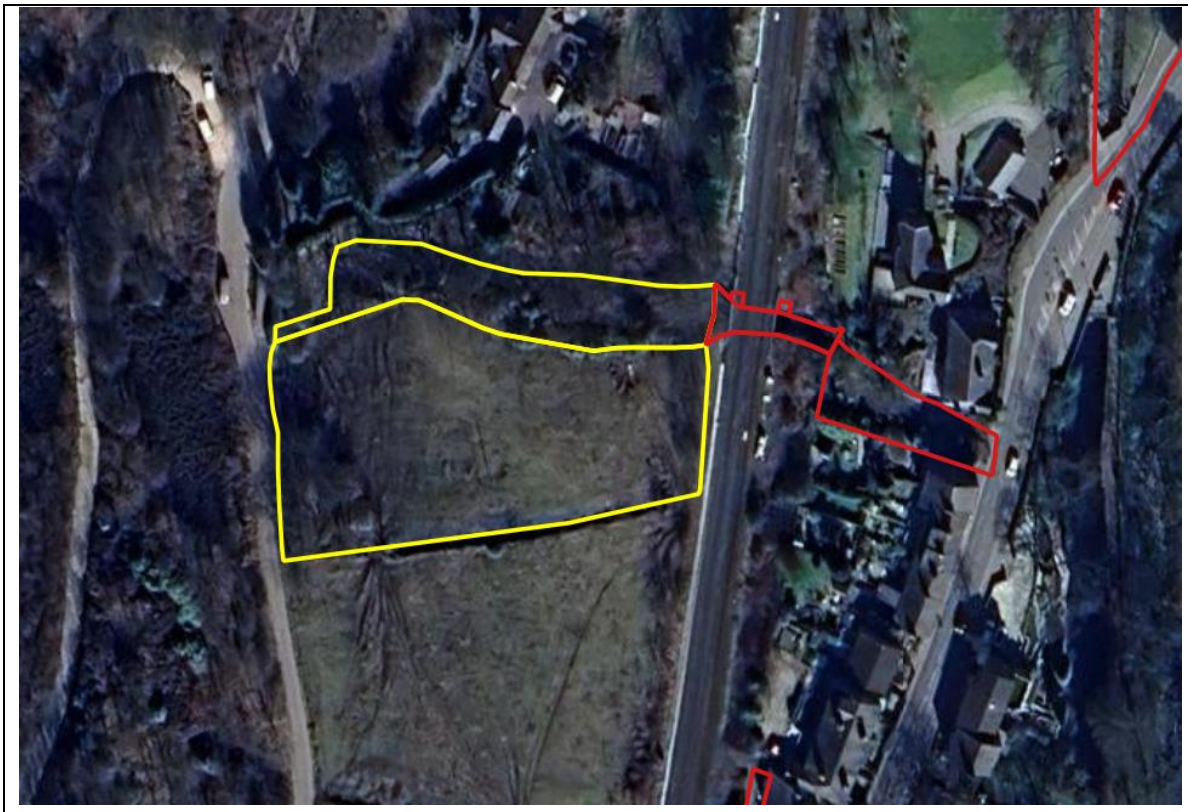
Proposals: Temporary land take for laydown area, superficial ground disturbance for footpath upgrade.

Known archaeological remains and potential

Located west of grade II listed railway accommodation Wickens Underbridge (MVL3/29), (NHLE 1451854), which accommodates a track beneath the railway line. Historic maps indicate quarrying to the north-west at Wickens Quarry, and to the south-west at Top o' th' Croft Quarry. No features are indicated within the compound area.

Likely Scheme impacts

It is not anticipated that the Order Scheme will impact upon any significant archaeological or built heritage remains. No mitigation works.



Location of proposed compound. Base Map: GoogleEarth 2025

B18. FORMER SADDLEWORTH STATION COMPOUND

Location Saddleworth Station Compound, Saddleworth, Oldham OL3 5QR

NGR SD 99570 06455

Land use and proposals

Current use: Grass and tree planting adjacent to road.

Proposals: Laydown area for materials to construct fencing. No earthworks required.

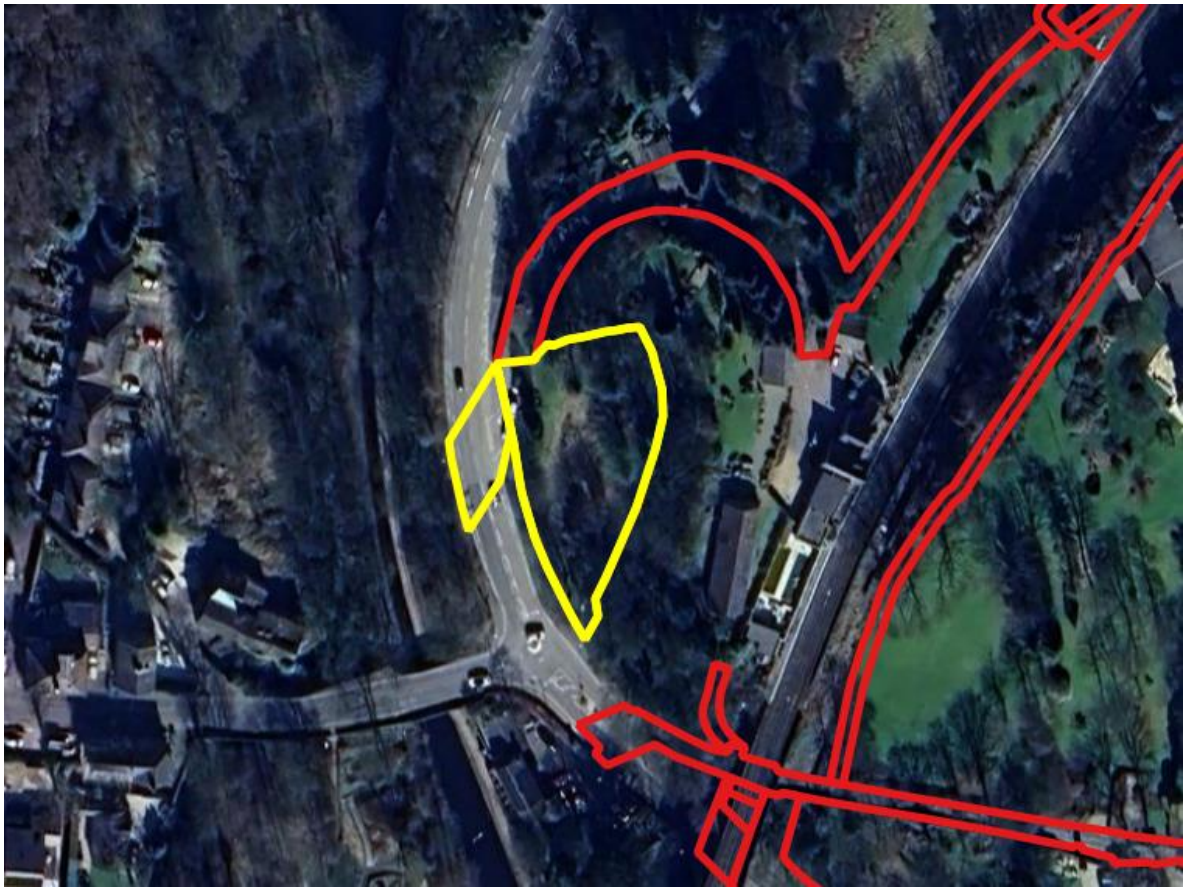
Known archaeological remains and potential

This proposed compound is located immediately west of the former Saddleworth Station (173.1.0) and to the north of the Uppermill Viaduct (MVL3/31) (NHLE 1068120), Lock 23 of the Huddersfield Narrow Canal (NHLE 1356719) and north-east of Brownhill Bridge Mill (NHLE 1309426), all of which are grade II listed. Uppermill Conservation Area is located c.45 m to the south-east.

Historic maps from 1854 to 1952 show that this was the location of Brownhill Quarry (sandstone). Due to its previous use as a quarry, no survival of archaeological remains is anticipated.

Likely Scheme impacts

It is not anticipated that the Order Scheme will impact upon any significant archaeological or built heritage remains. No mitigation works.



Location of proposed compound. Base Map: GoogleEarth 2025

OS Yorkshire Sheet 271 Surveyed: 1849 to 1851, Published: 1854 Source: National Library of Scotland

SD9906 – A Revised: 1952, Published: 1953 Source: National Library of Scotland

B19. BROWNHILL LANE ACCESS

Location 30, Brownhill Lane, Saddleworth, Uppermill, Oldham OL3 6BZ

NGR SD 99871 06534

Land use and proposals

Current use: Pasture land.

Proposals: Temporary access route.

Known archaeological remains and potential

There are no heritage assets recorded within the access route boundary.

The grade II listed building of Butterhouse Lindum Cottage (NHLE 1067465) is located c.90 m to the east.

A possible barrow (1096.1.0) is recorded on Brown Hill, c.110 m west of the site. It was dug by quarrymen in 1844, and its contents were mostly destroyed. Two urns (found at a depth of 4ft 6” [1.37 m] from the top the barrow) and a broken perforated celt were uncovered at the site. No visible evidence of the barrow was identified in the in the vicinity of Brown Hill during the site visit. The exact location of the barrow is no longer known, and further satellite burials may be present in this vicinity.

Historic maps show that the area was formerly fields, as it is now.

Low to moderate potential for prehistoric archaeological remains of low (local) to medium (regional) significance, depending on the presence / survival of any deposits associated with Bronze Age or later burials and the impact of 19th century quarrying.

Likely Scheme impacts

Whilst proposals for access route establishment are not yet available, it is anticipated that this may require vegetation clearance, ground levelling, and groundworks. These works have the potential to result in the truncation or removal of potential archaeological remains within the access route boundary.

It is likely that a staged programme of archaeological mitigation works may be required in advance of development. Further consultation will be undertaken with GMAAS to determine the scope and nature of such mitigation when further information is available about the compound layout and establishment.

Location of proposed access route. Base Map: GoogleEarth 2025

B20. OLD RAILWAY TUNNEL COMPOUND

Location Butterhouse Tunnel, Higher Ryefields Lane, Saddleworth, Uppermill, Oldham

NGR SE 00096 06851

Land use and proposals

Current use: Disused former railway line adjacent to Transpennine Route.

Proposals: Site compound for access with temporary RRAP with associated earthworks and tree removal.

Known archaeological remains and potential

The proposed compound is located c.150 m west of Holly Grove conservation area. It is located east of Huddersfield Narrow Canal, its associated Lock 27W and Lock 28 (NHLE 19040.1.0, 19041.1.0). No heritage assets are recorded within the compound boundary.

The compound is located within the cutting for the former Micklehurst Loop railway, constructed by the LNWR between Standedge and Stalybridge which opened in 1886 to aid congestion on the mainline. The route closed in 1966 although a short section at the southern end remained in use until 1972 serving the nearby Hartshead PowerStation. Forming the southern boundary of the compound is the surviving north portal to Butterhouse Tunnel which extends c.300 m to the south. The western approach to Butterhouse has been infilled but the eastern portal remains open. Constructed of blue engineering brick, the portal is now in poor condition, with fallen brickwork and coping stones present within the railway cutting.

Construction of the railway cutting has removed any potential for archaeological remains predating the railway to be present in this area. The compound is assessed to have low potential for unknown archaeological remains.

Likely Scheme impacts

It is not anticipated that the Order Scheme will impact upon any significant archaeological or built heritage remains. No mitigation works are therefore required.

B21. WARD LANE SATELLITE COMPOUND

Location Compound south of Ward Lane Overbridge (MVL3/36), Diggle Junction, Diggle OL3 5JU

NGR SE 00386 07687

Land use and proposals

Current use: Rough pasture.

Proposals: Site compound with associated access and earthworks.

Known archaeological remains and potential

The compound location is located between the Huddersfield Narrow Canal to the west, and Route Section W2B to the east. No heritage assets are recorded within the site.

The Huddersfield Narrow Canal No. 66 Bridge (grade II, NHLE 1067433) is located to the immediate west of the compound location, and Ward Lane Overbridge (MVL3/36) is located to the east over the railway alignment. Further to the north-west (across the canal) is 1 Ward Lane (grade II, NHLE 1164775) and Huddersfield Narrow Canal Lock Adjacent to Ward Road Bridge (grade II, NHLE 1253530).

Historic Ordnance Survey maps show that this compound location has remained undeveloped since at least the mid -19th century. There is a low potential for significant archaeological remains to be present has been identified in this area, which may have been previously impacted by canal and railway construction works.

Likely Scheme impacts

It is not anticipated that the Order Scheme will impact upon any significant archaeological or built heritage. No mitigation works are therefore required.

B22. GRANDPA GREEN SITE COMPOUND 1 AND GRANDPA GREENS SITE COMPOUND 2

Location Compound north of Ward Lane Overbridge (MVL3/36), Diggle Junction, Diggle OL3 5JU

NGR SE 00335 07576

Land use and proposals

Current use: Car parking and area of grassland / tree planting.

Proposals: Site compounds with associated access and earthworks.

Known archaeological remains and potential

The compound sites are located between the Huddersfield Narrow Canal and the Transpennine Route, to the north of Ward Lane. No heritage assets are recorded within the proposed compound boundary.

To the west are a group of grade II listed structures: Huddersfield Narrow Canal Lock Adjacent To Ward Road Bridge (NHLE 1253530), Huddersfield Narrow Canal No. 66 Bridge (NHLE 1067433) and 1, Ward Lane (NHLE 1164775), a mid-18th century house.

On the opposite side of the Huddersfield Narrow Canal, c.60 m from the compound are the sites of Warth Mill (or Wharf Mill) (HER 6094.1.0) and Ellis Mill (18088.1.0).

The 1st edition Ordnance Survey 6” map of 1854 shows a pond and small L-plan building to within the southern half of the site. This building is labelled on subsequent editions as Lock House, likely providing accommodation for the lock keeper, and was demolished by the mid-20th century.

Diggle Junction was located to the east of the site. This was the junction between the Huddersfield & Manchester Railway and the Micklehurst Loop, when came into use c.1881. The Diggle Junction Signal Box (HER 18983.1.0) is located directly to the east of the site, within the Network Rail land boundary. Erected in the 1880s, this is a large London & North Western Railway Type 4 signal box, however has been much altered externally with replacement of the timber cladding and windows.

Sidings were established across the northern half of the site in the late 19th century. The 1904 Ordnance Survey map shows railway sidings and buffers between the Huddersfield Canal and Diggle Junction. The map surveyed in 1963 shows the site occupied by two parallel, areas of tracks and sidings, separated by an embankment. Now removed, the former sidings is planted with young trees and in use as car parking. Fragmentary evidence of its past use survives today in the presence of bollards made of reused railway track along the access road from Ward Lane. To the east, within the Network Rail boundary, a cast iron lamp remains, now in poor condition, with the upper portion of the lamp and ladder now detached from the lamp post. To the west of the compound site is a timber lamp post with ladder, located hard against the boundary wall with the canal towpath. Archaeological traces

of trackbed, positions of sleepers and superficial railway infrastructure may survive within the area. Any such remains are likely to be of low significance.

Likely Scheme impacts

It is not anticipated that the Order Scheme will impact upon any significant archaeological or built heritage remains, or that mitigation works will be required.

Reused rails in the car park at Grandpa Green's compound.

Cast iron gas lamp post located within Network Rail land boundary.

Timber lamp post located to the west of the proposed compound.

Diggle Junction Signal Box (LNW, 1885), located outside the compound boundary.

B23. DIGGLE COMPOUND

Location Lee Side, Harrop Dale, Saddleworth, Diggle, Oldham, Greater Manchester OL3 5JZ

NGR SE 00549 07803

Lands use and proposals

Current use: Car park (west of Transpennine Route) and site compound (east of Transpennine Route).

Proposals: Site compound, associated earthworks, and strengthening of Standedge Canal Tunnel (MVL3/39A).

Known archaeological remains and potential

This compound comprises parcels of land to either side of the Transpennine Route in Diggle. No heritage assets are recorded by the greater Manchester HER within these areas.

Located c.90 m north along the Transpennine Route are the grade II listed tunnel portals to the Standedge Tunnel (MVL3/41) (NHLE 1452141). Harrop Green Conservation Area is located c.100 m to the north-west, and includes grade II listed buildings such as 11 Harrop Green (NHLE 1067460), and 7, 8 and 18 Harrop Green (NHLE 1163050). Directly to the north-east of the compound, the hamlet of Diglea is designated as a conservation area, and contains a number of grade II listed buildings including Ivy Cottage (NHLE 1309447), No.7 and Heather Cottage (NHLE 1162882). To the south of the compound, in the Ward Lane area is a group of grade II listed structures comprising Huddersfield Narrow Canal Lock Adjacent To Ward Road Bridge (NHLE 1253530), Huddersfield Narrow Canal No. 66 Bridge (NHLE 1067433) and 1, Ward Lane (NHLE 1164775), a mid-18th century house.

A number of non-designated assets are recorded in proximity to the compound. These include 19th century villas (HER 18982.1.0, 18998.1.0, 18997.1.0), a village school of 18th and 19th century date (HER 19000.1.0), and transport-related structures including Canal Lock 32W on Huddersfield Narrow Canal, Diggle Junction Signal Box (18983.1.0) and non-designated railway bridges (Ward Lane Overbridge (MVL3/36) and Diggle Brook (MVL3/37)).

The proposed compound to the west of the Transpennine Route is formed by a small surfaced car park which lies over the south end of the Standedge Canal Tunnel (MVL3/39A). This portion of the canal tunnel was constructed in the 1890, extending the original canal tunnel to accommodate railway tracks running through the north-west bore of the Standedge Tunnel, which opened in 1894. The tunnel portal is of rock-faced masonry construction with chamfered coping stones and a date stone inscribed 1893. The tunnel entrance is formed by an arch of blue engineering bricks with decorative modern metal gates. Internally the first section of the tunnel is formed by a brick arch supported on stone walls, before transitioning to a reinforced concrete slab supported on stone walls. Dating from c.2000, this section of the tunnel supports the railways above.

Historic maps indicate that the compound area to the west of the railway line was used as railway sidings at its northern end from the second half of the 19th century. Historic Ordnance Survey mapping depicts the sidings to have included turntables, a weigh bridge and small structures. Further to the south, the compound area contained paired railway lines for the Micklehurst Loop, which continued from Diggle Junction (located to the north of Ward Lane) to run through Butterhouse Tunnel. The Micklehurst Loop was closed in 1966, after which time the lines and sidings were removed. The site was terraced, sloping down from the east to the tracks, removing any potential archaeological remains predating this phase of activity.

It is assessed that the compound area to the west of the Transpennine Route has moderate potential for remains associated with the railway sidings, and low potential for remains of other periods. Any such remains are likely to be of low significance.

Likely Scheme impacts

Reinforcement of the Standedge Canal Tunnel (MVL3/39A) is proposed at its southern end in order to accommodate additional loadings during the construction phase. This would comprise the addition of a concrete saddle over the top of the tunnel arch for a length of 25m. The strengthening works would be set back from the tunnel portal and would not result in any alteration to the fabric of the portal. These works would strengthen the tunnel and, when complete, would not result in any visible change to the tunnel portal, or understanding of its evolution and historic interest. Construction controls set out in the CoCP will be implemented to protect heritage assets during the course of construction works.

It is not anticipated that the establishment of the compound to the east of the Transpennine Route would impact upon any significant archaeological remains or built heritage. No archaeological mitigation works are therefore anticipated.

1. INTRODUCTION

1.1.1 This Ecology Technical Appendix presents an appraisal of the predicted ecology-related impacts and consequential effects of elements of the proposed Network Rail (Stalybridge to Diggle (Saddleworth) Enhancements) Transport and Works Act Order which require deemed planning and the associated temporary construction compounds and accesses required to deliver those elements (as described in Table 1-1 of Chapter 1 in Volume 1 of the Environmental Report [**NR14**]) (referred to as 'the relevant works elements' of the Order Scheme. Further details on the relevant works elements are included in Chapter 3 in Volume 1 of the Environmental Report [**NR14**] and shown on Figures 1.1.1 to 1.1.6 of the Environmental Report [**NR14**].

1.1.2 The 'Scheme Area' within this Technical Appendix (either generally or in respect of a relevant works elements of the Order Scheme) is defined as the combined footprint of areas where deemed planning permission is sought and areas of land temporarily required.

1.1.3 The appraisal reported within this Technical Appendix identifies impacts and effects which may arise during both the construction phase and during operation. The purpose of this appraisal is to:

- summarise legislation, policy and guidance relevant to ecological features and an appraisal of their value (section 2);
- describe the baseline environment in relation to ecology by identifying the ecological features (i.e. designated sites for nature conservation, priority habitats or protected/ priority species listed under Section 41 of the Natural Environment and Rural Communities Act 2006 (NERC Act) that are both present and might be affected by the relevant works and their relative nature conservation importance (section 3);
- complete an ecological appraisal to identify whether the relevant works would result in any effects on ecological features and assess the likely magnitude of these effects (beneficial or adverse (section 3);
- set out the measures that are incorporated in the design of the relevant works to avoid or reduce any predicted effects on ecological features of nature conservation importance (section 4);
- identify ecological compensation or enhancement measures that are proposed to offset any residual impacts based on the outcome of the desk study, field surveys and the ecological appraisal; to be delivered both through planning conditions and Network Rail commitments (section 4); and

- outline the commitment of Network Rail to deliver 10% biodiversity net gain for the wider TRU works, for which the Order Scheme forms part, through compensation both within and outside the Order Scheme Area (section 4).

1.1.4 The approach applied when undertaking this appraisal has taken account of the good practice guidance provided by the Chartered Institute of Ecology and Environmental Management[1]. It addresses relevant wildlife legislation, policy, and guidance as summarised in this Technical Appendix.

1.1.5 The appraisal is supported by the following Technical Appendices:

- Annex A: Ecology Legislation, Planning Policy and Guidance;
- Annex B: Methodology and Limitations;
- Annex C: Ecology Survey Data
- Volume 3, Appendix 6B: Habitats Regulations Assessment of this Report [**NR14**]
- Volume 3, Appendix 6C: Proposed Tunnel Bat Survey Methodology of this Report [**NR14**]

2. RELEVANT LEGISLATION, POLICY AND GUIDANCE

2.1 National and Local Wildlife Legislation

2.1.1 This section provides a summary of legislation, policy and guidance that is relevant for the identification and appraisal of ecological features and their value. The following legislation has been considered as part of this appraisal:

- Environment Act 2021, Schedule 14;
- The Conservation of Habitats and Species Regulations 2017, No. 1012, Part 3, Regulation 43 (as amended);
- Wildlife and Countryside Act 1981 (as amended);
- Protection of Badgers Act 1992 (as amended);
- The Invasive Alien Species (Enforcement and Permitting) Order 2019. SI 2019/527;
- Natural Environment and Rural Communities Act 2006;
- Countryside and Rights of Way Act 2000 as amended);
- The Hedgerow Regulations 1997;

- Places for Everyone Joint Development Plan Document for Bolton, Bury, Manchester, Oldham, Rochdale, Salford, Tameside, Trafford and Wigan 2022 to 2039 Adoption Statement Oldham Metropolitan Borough Council (OMBC) (2024);
- Oldham Local Development Framework: Development Plan Document – Joint Core Strategy and Development Management Policies. (OMBC, 2011);
- Saved Unitary Development Plan policies (OMBC, 2006);
- Places for Everyone Joint Development Plan Document for Bolton, Bury, Manchester, Oldham, Rochdale, Salford, Tameside, Trafford and Wigan 2022 to 2039 Adoption Statement Tameside Metropolitan Borough Council (TMBC), (2004);
- Tameside Unitary Development plan (TMBC, 2004);
- Greater Manchester Five-Year Environment Plan 2025-2030 (Greater Manchester Combined Authority, 2024);
- All Our Trees: Greater Manchester's Tree and Woodland Strategy (City of Trees; 2024);
- Nature for All, A local nature recovery strategy for Greater Manchester – Draft for consultation. (Greater Manchester Combined Authority2025);
- Greater Manchester Biodiversity Action Plan (Greater Manchester Biodiversity project, 2009).

2.1.2 Compliance with legislation may include the attainment of relevant protected species licences prior to the implementation of the Order Scheme. Further information on the above legislation is provided as Annex A.

2.2 Planning Policy

National Planning Policy

2.2.1 The National Planning Policy Framework (NPPF)[2] details the Government's planning policies for England and how these are expected to be applied.

2.2.2 The NPPF provides guidance to local planning authorities on their local plans, sets out how planning authorities should deal with biodiversity when considering planning applications and encourages net gains for biodiversity

2 Ministry of Housing, Communities and Local Government (2024). National Planning Policy Framework. [online] Available at: https://assets.publishing.service.gov.uk/media/67aafe8f3b41f783cca46251/NPPF_December_2024.pdf. [Accessed: 14 July 2025]

to be sought through planning policies and decisions. The relevant guidance of the NPPF has been reviewed and incorporated where appropriate.

Local Planning Policy

2.2.3 A number of local planning policies relate to ecology, biodiversity and nature conservation and these are summarised in Table A-1, These policies have been considered when appraising potential ecological constraints and opportunities identified by the desk study and field survey, and when determining requirements for further survey, design options and ecological mitigation.

Biodiversity Policy

2.2.4 As a result of devolution and new country level and international drivers and requirements, much of the work previously carried out by the UK Biodiversity Action Plan (BAP) is now focused at a country level rather than a UK level. The UK BAP was succeeded by the 'UK Post-2010 Biodiversity Framework'[3]. The UK list of Species and Habitats of Principal Importance, however, remains an important reference source and has been used to help draw up statutory lists of priorities in England, Scotland, Wales and Northern Ireland. In England, the current lists are those under Section 41 (S41) of the Natural Environment and Rural Communities Act (NERC) 2006[4].

2.2.5 The national strategy for biodiversity is delivered at a local level via numerous local BAP (LBAP). Species and habitats of local conservation concern or value are included in the LBAP and an action plan is created for them. The LBAP relevant to the Order Scheme is The Greater Manchester Biodiversity Action plan (GM BAP)[5]. This identifies key habitats and species that may be found within Order Scheme Area and that may require consideration in design and mitigation. The priority habitats and species that have action plans for them under the GM BAP are detailed in Annex A.

2.3 Relevant Guidelines and Advice

2.3.1 The appraisal of the potential impacts of the relevant elements of Order Scheme on ecological features has taken account of the following key ecological guidelines:

- Bat Surveys for Professional Ecologists Good Practice Guidelines 4th Edition (Collins, 2023);

3 JNCC and Defra (on behalf of the Four Countries' Biodiversity Group) (2012) UK Post-2010 Biodiversity Framework. [online] Available at: https://data.jncc.gov.uk/data/587024ff-864f-4d1d-a669-f38cb448abdc/UK-Post2010-Biodiversity-Framework-2012.pdf. [Accessed: 14 July 2025]

4 Natural Environment and Rural Communities Act 2006, c. 16, Part 3, Section 41. [online] Available at: https://www.legislation.gov.uk/ukpga/2006/16/notes/division/6/3/1/2 [Accessed: 14 July 2025]

5 Greater Manchester Biodiversity project (2009). *Greater Manchester Biodiversity Action Plan*. [online] Available at: https://gmlrc.org/projects/gm_bap/. [Accessed: 14 July 2025]

- British Standard 42020:2013 Biodiversity: Code of practice for planning and development;
- Guidelines for Preliminary Ecological Appraisal. 2nd Edition (CIEEM, 2017);
- Guidelines for Ecological Impact Assessment in the UK and Ireland: Terrestrial, Freshwater, Coastal and Marine version 1.2. (CIEEM, 2022); and
- Natural England and Department for Environment, Food and Rural Affairs (DEFRA) Standing Advice: Protected species and development: advice for local planning authorities (Natural England, 2025).

3. APPRAISAL OF IMPACTS AND EFFECTS

3.1 Appraisal Methods

Consultation with Stakeholders

3.1.1 For the relevant elements of Order Scheme as described in Table 1-1 in Volume 1 of the Environmental Report **[NR14]**, consultation responses of relevance to ecology were received from several parties. This appraisal takes into account these responses, and a summary of ecology-specific comments is outlined below. Further details on consultee feedback and responses is provided in the Consultation Report supporting the TWAO [**NR07**].

Oldham Metropolitan Borough Council and Tameside Metropolitan Borough Council

3.1.2 Liaison with the GMEU Ecology Officers, including Oldham and Tameside Councils, has happened throughout development of Order Scheme. The GMEU enquired on the status of Sites of Biological Importance (SBIs) that are located within Order Scheme boundary, notably Grasscroft pasture SBI (Oldham), Cliffs at Mossley SBI (Tameside) and Armit Road Lodge SBI (Tameside). It was agreed that the mitigation hierarchy would be followed and enhancement would happen within the SBI impacted where feasible.

3.1.3 The GMEU were made aware that Network Rail wish to undertake a Biodiversity Net Gain (BNG) assessment using the Natural England Biodiversity Metric 3.0[6]. Metric 3.0 was used to maintain a consistent methodology across TRU and the wider TransPennine Route. BNG is not statutory for TWAOs; therefore, Network Rail are exempt, according to the Department for Environment, Food & Rural Affairs' Biodiversity net gain

6 Department for Environment, Food & Rural Affairs (DEFRA). (2021). Biodiversity Metric 3.0. [online] Available at: https://www.gov.uk/government/news/biodiversity-30-metric-launched-in-new-sustainable-development-toolkit [Accessed 14 July 2025].

exempt developments[7] from using the statutory version and being held accountable to the DEFRA Statutory Metric.

3.1.4 The GMEU stated that the Biodiversity Metric 3.0 could be used to measure impacts and have the objective to achieve a minimum 10% net gain across Order Scheme. Details of the commitment to achieve 10% BNG for the wider TRU works, for which Order Scheme forms part, is provided in section 4.4.

Natural England

3.1.5 Natural England is supportive of Network Rail's commitment to deliver 10% BNG across the TRU project. It requested that the pre and post development value of land within Order Scheme boundary is assessed using the Biodiversity Metric to account for losses within Order Scheme Area. Natural England advised that the mitigation hierarchy should be followed as per the Environment Act 2021 and paragraph 180 of the NPPF with the preference to deliver BNG on-site through habitat retention, enhancement and creation, then seeking off-site locations where this is not possible.

3.1.6 The statutory Biodiversity Metric has been used for habitat condition assessments due to the chance that BNG would become statutory for TWAO prior to submission. The data gathered from the statutory Biodiversity Metric condition assessments is comparable to the Biodiversity Metric 3.0 and can be translated accordingly where required.

3.1.7 Natural England's Discretionary Advice Service (DAS) was consulted on Order Scheme's impact to bats as a result of the works to Stalybridge and Scout Tunnels. Natural England provided a response letter[8] and agreed with the suggested methodology[9] for determining likely presence/ likely absence of roosting bats. Natural England stated the requirement for licencing where applicable, on-site ecological supervision to undertake visual inspections of any potential bat roosting features and sensitive timing to reduce impacts.

Environment Agency

3.1.8 The Environment Agency were consulted in relation to using the DEFRA Biodiversity Metric to account for impacts to watercourses within Order Scheme Area. The Environment Agency specified that River MoRPh assessment[10] should be completed to inform the DEFRA Biodiversity Metric.

Canal and Rivers Trust

7 Department for Environment, Food & Rural Affairs (DEFRA) (2024). Biodiversity net gain: exempt developments. [online] Available at: https://www.gov.uk/guidance/biodiversity-net-gain-exempt-developments. [Accessed 14 July 2025].

3.1.9 The Canal & Rivers Trust were contacted on 27 January 2025 regarding the availability of white-clawed crayfish data on the Huddersfield Canal. The Canal and River's Trust responded on 5 February 2025 with anecdotal evidence.

Methodology and Data Sources

3.1.10 The existing ecological baseline has been established using a range of sources including publicly available websites, data from the local biological records centre and field surveys. The detailed methodologies followed during the appraisal are outlined in Annex B and in summary comprised:

Desk Study

3.1.11 The desk study included a review of online resources and existing technical reports/ documents for the study area. A data request from Greater Manchester Local Record Centre was undertaken on 30 October 2024. The desk study sources and search areas for different ecological features are summarised in Annex B.

Field Surveys

3.1.12 Field surveys were undertaken in line with appropriate best practise guidelines as summarised in Table 3-1.

Table 3-1- Field Surveys

Survey	Description
UK Habitat Classification (UKHab) Surveys	These surveys were completed between May 2024 and June 2025. Habitats and ecological features of interest were recorded following the standard guidance provided in the UK Habitat Classification version 2.0[11]. The standard UKHab survey method was "extended" to record the presence or potential for protected, priority, and any invasive non-native plant species (INNPS) within the habitats present. A buffer of 50 m beyond Order Scheme was applied where access permitted (see Annex B for further details on the ecological features that were assessed).
Habitat Condition Assessments	These surveys were carried out in the field alongside UKHab habitat surveys on habitat parcels to support the BNG calculations, using statutory Biodiversity Metric 3.0 condition assessment sheets.
Preliminary Roost Assessments (PRAs)	These surveys were carried out in the field alongside UKHab habitat surveys to identify potential roost features in structures that could support roosting bats. PRAs were conducted in accordance with best practice guidelines provided by the Bat

[11] UKHAB Ltd (2023). *Habitat Classification v2.0.* [online] Available at: https://ukhab.org/register/.

Survey	Description
	Conservation Trust[12]. A buffer of 50 m beyond Order Scheme was applied where access permitted.
Ground Level Tree Assessments (GLTAs) for bats	Carried out in the field alongside UKHab habitat surveys to identify potential roost features in trees that could support roosting bats. GLTAs were conducted in accordance with best practice guidelines provided by the Bat Conservation Trust[12]
Bat dusk emergency surveys	Surveys were completed between July and September 2024 on the following structures (see Figures 1.1.1 – 1.1.6 of this Report [**NR14**]): Heyrod Hall Bridge (MVL3/07); Spring Bank Lane Footbridge (MVL3/09); Manchester Road Footbridge (MVL3/10); Stamford Road Footbridge (MVL3/13); Mossley Station Footbridge (MVL3/14); New Earth Footbridge (MVL3/16); Midge Hall Overbridge (MVL3/19); Wrights Mill Overbridge (MVL3/20); Charlotte Street Overbridge (MVL3/24); Royal George Underbridge (MVL3/25); Footway Underbridge (MVL3/26); Oldham Road Overbridge (MVL3/28); Den Quarry Underbridge (MVL3/30); Uppermill Viaduct (MVL3/31). Further details on the methodology and results of the bat surveys are provided in Annexes B and C respectively.
Bat automated/ static detector (likely presence/ likely absence)*	Surveys were completed between August 2024 and March 2025 on the following structures: Scout Tunnel; Stalybridge Tunnel. *Survey effort replaced dusk emergence following DAS consultation[8] with Natural England. The GLTA only identified one tree with PRFs which did not require presence/ likely absence surveys. Further details on the agreed methodology following Natural England DAS consultation is provided in Volume 3, Appendix 6D of this Report [**NR14**].
Badger	Camera trap monitoring of a potential badger sett off Spring Bank Lane.

[12] Collins, J. ed., (2023). Bat Surverys for Professional Ecologists Good Practice Guidelines. 4th ed. [online] Bat Conservation Trust. Available at: https://www.nhbs.com/bat-surveys-for-professional-ecologists-book.

Excluded Surveys

3.1.13 Targeted plant surveys (National Vegetation Classification (NVC) surveys) have not been completed as the habitats recorded during the UKHab surveys are generally common and widespread throughout Order Scheme Area and in the local area. More detailed habitat and condition assessment surveys will be completed if required to inform the requirements for compensation of certain habitats.

3.1.14 Due to the absence of suitable habitat within Order Scheme Area or agreed additional mitigation for supporting the following protected species/ species groups, surveys were not completed and they have not been considered further in this appraisal.

- Aquatic invertebrates – no aquatic habitats to be affected by the relevant elements of the Order Scheme;
- Fish – no aquatic habitats to be affected by the relevant elements of the Order Scheme;
- Great crested newt – waterbodies are present within 250 m of the Order Scheme, however, Network Rail wish to proceed under the NatureSpace Organisational Licence;
- Hazel dormouse– lack of suitable habitat present (coppiced hazel woodland) and the Order Scheme Area is outside of their natural range.

3.1.15 Additionally, habitats likely to support terrestrial invertebrates are present throughout the Order Scheme Area, however, they are typical of those found along the railway corridor and are unlikely to support diverse assemblages of invertebrates, or important populations of rare/ priority invertebrates. Localised, small habitat losses/ damage is unlikely to impact upon common invertebrate communities. Measures will be implemented throughout the design and construction phases which will aim to reduce any potential impacts to invertebrate communities by ensuring vegetation is available in areas adjacent to the Order Scheme Area. Terrestrial invertebrates have not been considered further in this appraisal.

3.1.16 Based on a review of desk study information, the suitability of habitats identified during the UKHab habitat surveys, and the confined locations of the Order Scheme Area, targeted surveys were not undertaken for the following protected species/ species groups but they are considered further in this appraisal:

- bats (foraging and commuting);
- birds;
- reptiles; and

- other priority species – brown hare, common toad, and western European hedgehog.

Study Areas and Survey Areas

3.1.17 The ecological 'study area' refers to the areas over which desk-based assessments have been undertaken and these vary for different ecological features (designated sites, habitats, flora and fauna). The study areas for the desk-based study are defined in Annex B.

3.1.18 The ecological 'survey area' is defined as the Order Scheme boundary plus a 50 m buffer where access was possible and considered pertinent to the survey.

3.1.19 The CIEEM guidelines require the establishment of a 'zone of influence' (ZoI) for the relevant elements which is defined in the guidelines as 'the area over which ecological features (habitats and species) may be affected by biophysical changes as a result of the proposed project and associated activities'. For some ecological features the ZoI will extend beyond the Order Scheme Area, for example where there are ecological or hydrological links beyond the boundary. It will also vary for different ecological features depending on their sensitivity to any environmental changes that may result from a scheme.

3.2 Baseline Conditions and Evaluation

3.2.1 The following sections provide a summary of the baseline ecological conditions, which have been identified through desk study and field surveys, for the Order Scheme Area of the relevant elements of the Order Scheme.

Summary of baseline ecological features

3.2.2 Refer to Figure 6.1.1 in Volume 2 of the Environmental Report [**NR14**] for the desk study and survey results for this relevant elements of the Order Scheme.

Designated Sites

3.2.3 Four internationally statutory designated sites for nature conservation were identified within the study area of the Order Scheme, comprising of Special Areas of Conservation (SAC) and Special Protection Areas (SPA) as outlined within Table 3-2 below and shown on Figures 6.1.1 in Volume 2 of the Environmental Report [**NR14**].

Table 3-2 - Internationally important designated sites for nature conservation within the study area of the Order Scheme

Designated site name	Features of Interest	Approximate Distance and direction from Scheme (at closest point)
Peak District Moors (South Pennine Moors Phase 1) SPA	ARTICLE 4.1 QUALIFICATION (79/409/EEC) During the breeding season the area regularly supports: • Short-eared owl - at least 2.2% of the GB breeding population Count, as at 1990 and 1998; • Merlin - at least 2.3% of the GB breeding population Count as at 1990 and 1998; • European golden plover - [North-western Europe - breeding] at least 1.9% of the GB breeding population Count, as at 1990 and 1998.	780 m east of the Order Scheme.
South Pennine Moors SAC	Annex I habitats that are a primary reason for selection of this site: • European dry heaths; • Blanket bog; • Old sessile oak woods with Ilex and Blechnum in the British Isles; • Annex I habitats present as a qualifying feature, but not a primary reason for selection of this site: • Northern Atlantic wet heaths with cross-leaved heath; • Transition mires and quaking bogs.	780 m east of the Order Scheme.
South Pennine Moors Phase 2 SPA	ARTICLE 4.1 QUALIFICATION (79/409/EEC) During the breeding season the area regularly supports:	980 m north of the Order Scheme.

Designated site name	Features of Interest	Approximate Distance and direction from Scheme (at closest point)
	• Short-eared owl - 0.3% of the GB breeding population Count as at 1990; • Merlin - 2.2% of the GB breeding population Count as at 1995; • European golden plover - [North-western Europe - breeding] 1.3% of the GB breeding population No count period specified. Article 4.2 Qualification (79/409/EEC): an internationally important assemblage of birds	
Rochdale Canal SAC	Annex II species that are a primary reason for selection of this site: • Floating water-plantain.	7.45 km west of the Order Scheme, with hydrological connectivity upstream.

3.2.4 Eight Sites of Special Scientific Interest (SSSI) were identified within the study area of the Order Scheme as outlined within Table 3-3 below and shown on Figure 6.1.1 in Volume 2 of the Environmental Report [**NR14**].

Table 3-3 - Nationally important designated sites for nature conservation within the study area of the Order Scheme

Designated site name	Features of Interest	Approximate Distance and direction from Scheme (at closest point)
Huddersfield Narrow Canal SSSI	• Designated for the best example of flowing eutrophic water in Greater Manchester, also including swamp, tall fen, and other marginal vegetation; • Diverse range of aquatic flora; and • Diverse range of aquatic fauna, including molluscs and fresh-	Within the Order Scheme boundary.

Designated site name	Features of Interest	Approximate Distance and direction from Scheme (at closest point)
	water sponge.	
Dark Peak SSSI	• Designated as primary moorland area of the Peak District with areas of open and continuous moorland; • Nationally important populations of golden plover, dunlin, and very significant populations of meadow pipit; • Significant populations of red grouse, short-eared owl, twite, and peregrine; and • Diverse range of terrestrial invertebrates.	780 m east of the Order Scheme.
South Pennine Moors SSSI	• Designated for containing the largest area of unenclosed moorland within West Yorkshire; • Diverse upland plant communities; • Extensive areas of blanket bog with species rich acidic flushes and mires; and • Supports a nationally important moorland breeding bird assemblage including golden plover and twite.	780 m north of the Order Scheme.
Standedge Road Cutting SSSI	Designated for features of geological interest.	1.27 km north-east of the Order Scheme.
Lowside Brickworks SSSI	Designated for geological features of natural importance.	3.35 km west of the Order Scheme.
Park Clough SSSI	Designated for features of geological interest.	4.35 km north-east of the Order Scheme.
Hollinwood Branch Canal SSSI	• Designated for the best example of a mesotrophic standing water system in Greater Manchester and	4.73 km west of the Order Scheme.

Designated site name	Features of Interest	Approximate Distance and direction from Scheme (at closest point)
	Merseyside; • Habitats include open water, swamp and tall fen; and • Diverse open water plant communities containing several regionally and nationally rare species.	

3.2.5 Additionally, 22 locally important sites comprising twelve Sites of Biological Importance (SBI) and ten Local Nature Reserves (LNRs) were identified within the study area of the Order Scheme as outlined within Table 3-4 below and shown on Figure 6.2.1 in Volume 2 of the Environmental Report [**NR14**].

Table 3-4 - Locally important sites for nature conservation within the study area of the Order Scheme

Designated site name	Features of Interest	Approximate Distance and direction from Scheme (at closest point)
Armit Road Lodge SBI	Ponds and small lodges.	Within the Order Scheme.
Cliffs at Mossley SBI	Semi-natural broadleaved woodland. Semi-natural grassland.	Within the Order Scheme.
Grasscroft Pasture SBI	Semi-natural grassland. General species- solitary bees. General species- fungi.	Within the Order Scheme.
Huddersfield Narrow Canal (North) SBI	Large Areas of Standing Open Water.	Within the Order Scheme.
Huddersfield Narrow Canal (South) SBI	Large Areas of Standing Open Water as per the Greater Manchester SBI Selection Guidelines 2016.	Within the Order Scheme.
Moorgate Quarry SBI	Heathland and Bog. Semi-natural grassland. Habitat mosaics.	17 m east of the Order Scheme.
Hartshead SBI	Semi-natural broadleaved woodland.	23 m east of the Order Scheme.

Designated site name	Features of Interest	Approximate Distance and direction from Scheme (at closest point)
Royal George SBI	Ponds and small Lodges. Large Areas of Standing Open Water.	70 m east of the Order Scheme.
Marshes at Staley Hall SBI	Acid grassland with marsh and ditches.	220 m east of the Order Scheme.
Puddle Clay Pits SBI	Site supports a complex mosaic of habitats including marsh, flush, swamp, dry heath, open water, acid and neutral grassland.	240 m east of the Order Scheme.
Castle Clough SBI	Deciduous woodland.	430 m east of the Order Scheme.
Dacres SBI	Lowland meadow and Lowland dry acid grassland.	380 m east of the Order Scheme.
Brushes Valley LNR	Area of woodland, meadow, and wetlands adjacent to Brushes Reservoir.	640 m south-east of the Order Scheme.
Castle Clough and Cowbury Dale LNR	Area of broadleaved woodland straddling the banks of the Staly Brook watercourse.	0.78 km east of the Order Scheme.
Knot Hill LNR	Historically a reservoir, now a site of upland semi-natural habitat with agricultural grazing presence.	1.15 km west of the Order Scheme.
Cowbury Dale LNR	Meadow habitat surrounded by broadleaved woodland with a small lake present.	1.20 km east of the Order Scheme.
Rocher Vale LNR	Site supports a mosaic of habitats including riverbanks, woodland, and a heath.	2.67 km west of the Order Scheme.
Glodwick Lows LNR	Site supports a mosaic of habitats including grassland, heathland and woodland. Wildlife includes foxes, mining bees and field bindweed.	3.06 km west of the Order Scheme.
Haughton Dale LNR	Oak, ash and alder woodlands supporting bluebells and, in wet areas, golden saxifrage. The woodland is an important habitat for birds, including woodpecker, owl, bullfinch and nuthatch.	4.45 km south-west of the Order Scheme.
Hollinwood Branch Canal LNR	Large Areas of Standing Open Water.	4.53 km west of the Order Scheme.
Hurst Clough LNR	Woodland and wildflower meadows supporting butterfly assemblages.	4.56 km south of the Order Scheme.

Designated site name	Features of Interest	Approximate Distance and direction from Scheme (at closest point)
Werneth Low LNR	Site supports a mosaic of habitats including woodland, dry heath, and wetlands.	4.93 km south of the Order Scheme.

Irreplaceable Habitats

3.2.6 Six ancient or veteran trees were recorded within the study area of the Order Scheme during the desk study as outlined within Table 3-5 below and shown on Figures 6.4.1 to 6.4.22 in Volume 2 of the Environmental Report [**NR14**].

3.2.7 Lowland fen and blanket bog (Table 3-5) were recorded within the study area of the Order Scheme during the desk study.

Table 3-5 - Ancient or veteran trees recorded within the study area of the Order Scheme during the desk study

Ancient and Veteran Tree (reference)	Details of Ancient or Veteran Tree	Approximate Distance and Direction from the Order Scheme
174081	Veteran silver birch.	120 m east of the Order Scheme.
189809	Veteran common hawthorn.	360 m east of the Order Scheme.
189810	Veteran common hawthorn.	360 m east of the Order Scheme.
189811	Veteran goat willow.	400 m east of the Order Scheme.
189812	Ancient common hawthorn.	530 m east of the Order Scheme.
189813	Veteran common hawthorn.	540 m east of the Order Scheme.

Priority Habitats
